He says that he knew Drawbaugh to be working on improvements in telephones, but that Drawbaugh did not tell him how long he had been so engaged, and witness made no inquiry, because he cared nothing about the improvements.

He does not remember of seeing any telephones at the time of the conversation, although he says it is possible that Drawbaugh showed him one either then or soon after, and he thinks he had never seen any before that conversation.

He thinks the conversation was before Mr. Weaver prepared the application for a patent on the magnetic clock. (May, 1878. See Weaver, Ans. 476.)

He did not see at the shop either "F" or "B," and swears as a fact that he could not have seen them and forgotten it.

He testifies further, that after the first conversation above given he took no further interest in Drawbaugh's telephone, and never paid any attention to it.

Upon being shown "Exhibits A, G, K, L, M, N, O and P," he says that he has seen "A" somewhere, and may have seen it at Drawbaugh's shop, but is positive that the other instruments could not have been there openly.

He saw at the shop one pair of instruments which Drawbaugh had connected there, but does not recognize it among the exhibits.

On examination, it will be seen that his answers, particularly on cross-examination, are contradictory, and many of them manifestly evasive; and it must be noted that he was a member of the clock company which failed to realize a fortune out of that invention.

It is difficult to understand his testimony that Drawbaugh told him he had none of his old machines at the time of the conversation—in the spring or early summer of 1878. If that remark has reference to Drawbaugh's first instruments, his old tea-cup transmitter and its hoop receiver, it is correct. They were probably lost or destroyed long before that time. If it has reference to his subsequent early instruments, it probably was never made, as it is difficult to conceive that Drawbaugh could have any motive for denying the existence of instruments which complainant's own witnesses proved to have been in existence at that time; Shapley and I. D. Landis having seen "B" in October, 1876; Charles A. Landis in

April, 1877; Henry R. Musser shortly before January 31, 1878; George C. Rupp having seen "A" in the winter of 1877-78; Ziegler and Wirt in the early summer of 1878 (at Harrisburg).

But that the witness did know more about Drawbaugh's telephone than he remembers, or at least testifies to, is apparent from the testimony of

F. F. Landis (D. S.-reb. 897), who testifies that in November, 1877, he was at Drawbaugh's shop in company with J. E. Shettel and Theodore Grissinger, that Drawbaugh then showed him, in the presence of Shettel and Grissinger, Exhibit "D," and an instrument closely resembling "H."

Furthermore, complainants' witness Theophilus Weaver testifying with regard to a conversation which he says he had with Drawbaugh concerning a phonographic clock attachment, says that Drawbaugh told him "that he did not feel inclined to let the Grissingers, or party who were partners in the clock, have a footing in that invention unless they would come out fair and square on the clock first" (C, Vol. 1 p. 398, Ans. 91). And thus it may be that Drawbaugh, not being over-confident in the integrity of Grissinger, may have intentionally withheld from him definite information with regard to his telephone experiments.

Edmond C. Harro (C. Vol. 1, p. 945) testifies that he lived at Eberly's Mills for two years, beginning March 1, 1875; that he remembers of Drawbaugh moving his family to Mechanicsburg during that period; that he visited Drawbaugh's family both at Milltown and Mechanicsburg; that he heard Drawbaugh's electric clock talked about in his family, he cannot say how often, nor by whom; that he was at Drawbaugh's shop, and the latter showed him his clock, and explained it to him; he also heard it spoken of by others; that Drawbaugh mentioned to him his instrument for telegraphing without a battery; that he was at Drawbaugh's shop only a few times, however, and had no particular business when he went there.

He further testifies that he never heard Drawbaugh's talking machine spoken of in his (Drawbaugh's) family, nor by any one else about the village, and that he would be likely to remember the fact if he had heard of it.

He is shown instruments " A to Q" except " H, J and P." and says he don't think he ever saw any of them anywhere.

His testimony is commented upon on the main brief.

Daniel Hart (C. Vol. 2, 1512) testifies that he has lived at Milltown for the past fifty years, within 200 or 300 yards from the grist mills; that he heard of Bell's telephone about the time of the Centennial; that he does not know that he had heard before that time that Daniel Drawbaugh had a talking machine or telephone, and that he does not know whether, when he heard of Bell's telephone, it struck him as something new or not. He thinks, however, that if Drawbaugh had had a talking machine that people could talk through, for six or eight years before he heard of Bell's telephone, and it had been common talk in the village for that length of time, that he would have heard of it.

He further testifies that the first time he remembers of hearing of Drawbaugh's talking-machine was soon after Drawbaugh sold the invention, in 1880.

And further, that, although he admits he never went to the shop much, Drawbaugh couldn't have had a talking-machine there, either three or four, or ten or twelve years prior to 1880, unless he kept it hid or in the dark, without his hearing of it.

It will be observed that this deposition, if it proves anything, proves too much, inasmuch as a large number of complainant's own witnesses have distinctly testified to seeing, and some of them, to talking through various talking-machines or telephones at Drawbaugh's shop from October, 1876, down to 1880. This deposition, therefore, furnishes an excellent illustration of the utter unreliability of the negative testimony put in by the complainants in this case.

But Daniel Hart is contradicted:

First. By David H. Good (D. Vol. 1, 505) who testifies (506-7), that in the fall of 1868, he heard Daniel Drawbaugh, in his store, tell two men that he had a talking-machine by which he could convey sound or talk as plainly as he was then talking; and that he could talk to a distance. And one of these men, he testifies, was

"Mr. Hart," whom complainants have assumed to be Daniel Hart (C. Vol. 2, 1513-14, Ans. 15 to 18.)

Second. By William Natcher (D. S-reb., 149), who testifies that whilst he lived in Eberly's Mills (April 1, 1870, to September 5, 1870, and October 17, 1871, to August, 1872), it was generally spoken of in the village of Milltown, that Daniel Drawbaugh had a talking-machine by which he could communicate from one place to another, and among others whom he heard speak of it he particularly mentions Daniel Hart.

Third. By William H. Martin (*Id.* 827) who testifies that in 1870 he worked at building an addition to the house of Daniel Hart; [August and September, 1870. See Abraham May, D. S-reb., 1029, 1030]; that whilst engaged at that work he boarded in the family of Mr. Hart, and then and there heard Drawbaugh's talking-machine spoken of at the table in the presence of Daniel Hart.

Fourth. By George Hosler (*Id.* 367) who testifies that he lived and carried on shoemaking at Eberly's Mills from March 5, 1872, to March 25, 1873; that during that time Drawbaugh's talking-machine was a matter of common and general knowledge in the community, and the subject of general conversation; that it was frequently talked of both in and out of the shop; that his shop was quite a place of resort for people to come in and talk; that Daniel Hart frequently came there, and that from the extent and frequency of the talk in that community at that time about Mr. Drawbaugh's talking-machine invention, he does not believe that anybody could have been in the village and talked with the people very much without hearing something about Mr. Drawbaugh's talking-machine.

David A. Hauck (C. Vol. 1, 786) was a member of the firm of Hauck Bros. & Co., who manufactured faucets at Drawbaugh's shop from July, 1873, until August, 1874. He testified that although he spent a good deal of time there during that period, and although Drawbaugh showed him other inventions, he never saw or heard of the talking machine there at that time.

It appears, however, on his cross-examination that he had a controversy in the patent office in 1879 with Drawbaugh over a measuring faucet, which both he and Drawbaugh claimed to have invented, in which controversy he was adjudged, both by the examiner of interferences, and subsequently, on an appeal, by the board of chief examiners, to have sworn falsely. Both of these tribunals decided that he did not only testify falsely concerning a material matter in the case, but that he had taken a false oath upon filing his application for patent, and that he was not at all an inventor of the faucet in controversy, but had stolen it from his opponent Drawbaugh. Certainly no weight can be attached to his testimony in view both of his hostility to Drawbaugh arising out of the faucet controversy, and of the adjudication by two tribunals constituted by law for the determination of questions of fact, that he had perjured himself. It is, therefore, not deemed necessary to discuss his testimony any further.

Samuel F. Hauck (C. Vol. 2, 1,160) testifies that he was a member of Hauck Bros. & Co., who purchased the machinery, etc., of the Drawbaugh Manufacturing Company; that at about that time he spent several hours at Drawbaugh's shop examining the property of the company, and at that time was all through the shop; that he worked occasionally, in 1873–74, in the shop himself, at different times, for a day or a half a day at a time, and once in August, 1873, four days; that he had occasion to go to the shop for faucets at different times during the latter part of 1873 and the spring of 1874; that his relations with Mr. Drawbaugh personally were very friendly, and and that Drawbaugh was accustomed to show him his inventions, of which he mentions a number; that on one occasion in 1876 or 1877, Drawbaugh asked him how he would like to go into an electric clock; that his relations with Drawbaugh were such that, in his judgment, if the latter had had in his shop a practical speaking telephone capable of being used, which he freely showed to other people, and which were exposed to observation in his shop, he would have known it; and further, that if such telephones had been personally tested and used by a large number of persons who knew of their practical operation and use, he also would have known of their existence and their practical operation and use; and further, that if whilst he was visiting Drawbaugh's shop the latter had had a speaking telephone which was successfuly operated on many occasions in the presence and hearing of many other persons, and knowledge thereof had been freely communicated to the public, he would have known the fact.

Upon being shown the instruments A to Q inclusive he denied ever having seen any of them.

Upon being recalled for further cross-examination, he repeated his former testimony that Mr. Drawbavgh had never said anything to him about telephones or talking machines, and that he never saw any at his (Drawbaugh's) place; and upon being asked to look at A, B, D and C again, he testified that he did not remember ever having seen them, or any of them prior to the institution of this suit.

He further testifies that he was acquainted with David A. Uhrich and Jacob Kimmel, but that he did not remember of going to Daniel Drawbaugh's shop in company with David Uhrich, and remembered of seeing Jacob Kimmel only once at Daniel Drawbaugh's shop, and then David A. Uhrich was not there.

He further denied having any recollection of ever having seen or being shown any telephones at Mr. Drawbaugh's shop in the presence of Uhrich and Kimmel, and that he felt as sure that no such exhibition of telephones to him had taken place as of anything else he had testified to in this case.

He is contradicted:

First.—By Jacob Kimmel (D. S.-reb., 178), who testifies that he was at Drawbaugh's shop, to the best of his knowledge, in 1877, and then and there met Samuel F. Hauck and David Uhrich; that Daniel Drawbaugh then and there showed them his talking machine; that all three were looking on while Drawbaugh was explaining it; that Drawbaugh took it apart and showed them the inside of it; and that thereupon Samuel F. Hauck asked Drawbaugh for a telephone or talking machine to take along home, to put up, which Drawbaugh, however, was not able to give him.

Second.—By David A. Ulrich (*Id.*, 219), who testifies that about the year 1876 he accompanied Samuel F. Hauck to Drawbaugh's shop at Eberly's Mills, and there met Jacob Kimmel; that whilst they were there together at that time Daniel Drawbaugh showed them some of his speaking machines; that Samuel F. Hauck was present and talked to Drawbaugh about the speaking machines at that time.

He further testifies that he at that time saw a large machine and a small one something similar to A and D; and further that he was never at Drawbaugh's shop except upon that one occasion.

George W. Heiges (C. Vol. 2, p. 1089) testifies that on Sunday, the 3d of March, 1878, he accompanied his uncle, George W. Mumper, and cousin, M. J. Bailey, to Daniel Drawbaugh's shop for the purpose of seeing Drawbaugh's electric clock, which Drawbaugh then and there showed them and explained at length. He further testifies that Drawbaugh did not say anything to them on the subject of electric speaking telephones. Upon being shown the Exhibits "A" to "Q," inclusive, he testifies that he never saw any of them at Drawbaugh's shop.

Mr. Drawbaugh, however, appears to have been of the opinion that he did mention the subject to them, inasmuch as the witness testifies that Drawbaugh asked him in November or December, 1881, whether he (witness) remembered of his (Drawbaugh's) saying anything to him upon the occasion of the visit testified to, about his talking machine or telephone, and that he (Drawbaugh) had been to see him (Heiges) at York with regard to the matter.

In the depositions of Bailey and Heiges we have another illustration of the worthlessness of complainants' negative testimony. According to their testimony they were at Drawbaugh's shop March 3, 1878, and did not see any talking machines, nor was the subject mentioned. Nevertheless, according to the testimony of complainants' own witnesses Drawbaugh had talking machines there at time, which he was talking through and exhibiting to others.

According to the testimony of Shapley and I. D. Landis, Exhibit "B," was there as early as October 3d, 1875, and Drawbaugh was so enthusiastic about it that he declared that it was to revolutionize the world and take the place of telegraphing. According to Shapley he had talked through it. According to the testimony of George W. Roe, also, he was at work on the talking machine in October, 1876. According to the Ditlows he was using the talking machine in the spring of 1877 to talk through, and that necessitated not only a receiver but a transmitter. Charles A. Landis saw "B" at Drawbaugh's shop early in April, 1877. Drawbaugh had told Orlando Kahney in the fall of 1876 about his talking machine, and had told him that he expected to make an independent fortune out of it; that he hadn't it patented because he had not the the money to get it patented with. Kahney had heard him talk through it in the winter of 1877-78; so had A. L. Rupp and G. C. Rupp. During the year 1877 Jacob Evans had heard it spoken of about Milltown. H. R Musser had seen several talking machines before January 3, 1878. Drawbaugh had spoken to Lloyd and Worley about it in February, 1878. Several receivers were in existence, "A" as well as "B" (Geo. C. Rupp), and yet Drawbaugh did not show or speak of his talking machine to Bailey and Heiges. The explanation, assuming that he did not (for they might, as others of complainants' witnesses in the case have done, seen talking machine and forgotten the fact) is very simple. They went to his shop for the purpose of seeing his electric clock; they saw it and came away after their curiosity concerning it was satisfied.

John F. Hursh (C.Vol. 1, 1055) testifies that he moved to Kansas in November, 1879; that prior to that time he had resided in Fairview township, York County, Pennsylvania, not far from Milltown; that he had been a member of the Drawbaugh Pump Company, or Drawbaugh Manufacturing Company, from 1867, and that said company ceased manufacturing in 1871; that during that period he was accustomed to go to the machine shop at Milltown at intervals of two weeks or longer; that he had access to, and went to different parts of the building; that he got a ram from Daniel Drawbaugh in May of the Centennial year, and had been, between 1871 and that time, at Drawbaugh's shop, probably at intervals of six months or a year; that Drawbaugh had spoken to him about inventions and machines he was getting up, and had gotten up, and seemed pleased to talk about his new inventions, a number of which he (Hursh) names. He testifies, however, that Drawbaugh first spoke to him about his talking machine in 1878, in or about September, and that he then showed him instruments. Upon being shown "Exhibits" from "A" to "P," inclusive, except "K," he indentifies "B" as one which he saw at that time, and says that he faintly recollects something like "A" and "F," but none of the others. And further testifies that this communication by Drawbaugh to him was after he had heard of speaking telephones elsewhere.

He further testifies that he is "willing to swear that, as a matter of fact," Mr. Drawbaugh did not have electric speaking telephones in his shop at least four years prior to the beginning of the Centennial year (1876), and show them to different persons during those four years (*Id.* 1062, cross-Q. 64); but upon further cross-examination admits all he can testify to is that he did not see the talking-machine there himself prior to 1878. (*Id.* 1064, Cross-Q. 80.)

He is contradicted.

First.—By Abraham Fisher (D. Vol. 2, 688–9), who testifies that along about 1868 or 1869, about a year after Mr. Hursh went into the faucet business, he (Fisher) and John F. Hursh, who is his first cousin, went to Drawbaugh's shop together one evening, when Drawbaugh showed and explained to them his talking machine.

Second.—By Henry S. Magonell (D. S.-reb., 963), who testifies (p. 965, *et seq.*) that before he was married (November 3, 1873) John F. Hursh told him about Drawbaugh's talking machine, and asked him to come along over to Drawbaugh's shop to see it; that this conversation took place about two winters before he was married, and that Hursh spoke to him at different times afterwards about it.

Third.—By Jacob Miley (*Id.* 171), who testifies that John F. Hursh, who is his first cousin by marriage, told him about Drawbaugh's talking machine "in 1873–4 or 1875, along there—I couldn't say now which of the three. It is from eight to ten years ago [November 5, 1883] anyhow; it is not less than eight, and maybe ten, years ago. * * * He came to my place—in the week, Thursday or Friday—and asked me to go with him to Mr. Hertzler's and Drawhaugh's on a Sunday, and the weather being bad on that Sunday we didn't get going. He had stated to me that Mr. Drawbaugh was working at a speaking machine, or talking machine; that is what he called it—talking machine. That is about all; we didn't get to see it." (*Ib.* 171, Ans. 89.)

He further testifies that the idea Mr. Hursh gave him of Drawbaugh's talking machine was that it was to be used for talking from one place to another.

Fourth.—By George W. Atticks (*Ib.* 300), who testifies (302, 303) that he and John F. Hursh, who is his brother-in law, had a conversation about Drawbaugh's talking machine between 1875 and 1877, and that they not only talked about Drawbaugh's talking machine, but also of going up to his shop to see it.

Orlando Kahney (C. Vol. 1, 990) testifies that he moved to the West, April 1, 1879; that prior to that time, from 1871, he lived and worked at various places in the neighborhood of Milltown, among other places at Wilson Walters', which he left some time in 1875; that he was well acquainted with Daniel Drawbaugh

He further testifies that he was at the Centennial Exhibition, October 31, 1876, and several days thereafter; that he first heard of Drawbaugh's talking machine on the second Sunday after he returned home from Philadelphia, when Drawbaugh himself told him about it.

On cross-examination, however, he fixes the date of the conversation in the fall of 1877, instead of the fall of 1876.

He further testifies that Drawbaugh first talked to him through his talking machine some time in the winter of 1877–78.

He further testifies that he saw at Drawbaugh's shop Exhibits "F" and "B," in Drawbaugh's office; that he did not at the time know what they were for; and does not remember whether it was before or after he first heard that Drawbaugh was working on talking machine; and that he may have seen them there more than once; that he never knew what said instruments were for until within a year of the time when his deposition was taken; that he also saw exhibit "A" at Drawbaugh's shop;

whether before or after the fall of 1876 he does not remember; and that he did not know what it was for.

He fails to identify any other exhibits, but remembers of seeing a box with a bell on it, which may have been "Exhibit H." He has no recollection of the instrument that he put to his ear when Drawbaugh talked to him.

It further appears from his testimony that he was frequently at Drawbaugh's shop whilst living in the neighborhoood of Milltown.

He is contradicted by Milton Basehore (D. S.-reb., 116), who testifies that he and Orlando Kahney lived together at Wilson Walter's, in 1875; and that in July of that year, just prior to oats harvest, they went together to Drawbaugh's shop to grind some cradle scythes; that after they had finished grinding the scythes they remained a short time in the shop, and that Daniel Drawbaugh then and there talked through his talking machine, and Orland Kahney listened; and that whilst they were on their way home from Drawbaugh's shop, he (Kahney) discussed the subject of Drawbaugh's talking machine, and that witness gathered from Kahney's conversation that he (Kahney) had known about Drawbaugh's talking machine before that time; that he, Basehore, was never at Drawbaugh's shop before or since that time, and at the time of that visit work on axles was going on in the shop.

Basehore is corroborated as to the time by Wilson P. Walters (*Ib.* 121), who testifies that Basehore and Kahney were working for him in 1875, and that Kahney never worked for him after that year.

Orlando Kahney himself was recalled by defendants (*Ib.* 224), and testified that after he returned to the West from Philadelphia, after having given his deposition there there on behalf of complainants, he reflected further upon the subject of that deposition, and upon reflection remembered that he had seen and talked through Drawbaugh's talking machine at a much earlier date than that fixed by him in his Philadelphia deposition; that he thereupon wrote to Daniel Drawbaugh stating that he now remembered about his talking machine as far back as the year 1875, and that subsequently, March 8, 1883, before the testimony of complainants was closed, he wrote to one of complainants' counsel that since giving his deposition he found that he had made a mistake; that he now believed and knew that there was a telephone at Drawbaugh's shop as far back as 1873, and asking the advice of complainants' counsel as to what course he should pursue; that, receiving no reply to this letter, he wrote again to complainants' counsel on the 23d of May, 1883, again asking direction, but received no reply.

He further testifies that upon reflection he distinctly remembers a visit to Drawbaugh's shop with Milton Basehore, whilst they both lived with Wilson Walters; that they went to Drawbaugh's shop in July, 1875, just before oats harvest, to grind cradle scythes; that after finishing that job Drawbaugh took him into one corner of the shop, and giving him an instrument with wires attached to it, and directing him how to hold it to his ear, went out of the shop, whereupon he heard Drawbaugh's voice through the instrument, and understood what Drawbaugh said through it.

His description of the shape and size of the instrument which he held to his ear leaves little doubt that it was either D or E.

He further testifies that in the fall of 1875, whilst he was working for Joseph Best, he happened to be at Drawbaugh's shop one day, and Drawbaugh asked him if he [Kahney] could lend him $75 or $100 to get a patent on the talking machine.

He further testifies that he remembers of being at Drawbaugh's shop either in 1872 or 1873, possibly 1874 (as he was not able to fix the date accurately), when he saw the same wires in the same place where they were when he ground the cradle scythes, and Drawbaugh used them with the talking machine to talk to him.

Benjamin Kaufman (C. Vol. 1, 939) testifies that he moved to Illinois in February, 1878; that prior to that time for twenty-five years he had lived in or about Eberly's Mills or Milltown; that he had known Daniel Drawbaugh for thirty or thirty-five years; was in his shop whilst the Drawbaugh Manufacturing Company was making faucets, and was accustomed to go to the shop from the time the Drawbaugh Company commenced work until he moved to Illinois "middling often;"

that he met Drawbaugh often at the store and around in Milltown; that Drawbaugh told him about his clocks, but never told him anything about his talking machine, nor showed him any, and that the first knowledge he ever had about talking machines was in Illinois, about a year after he (Kaufman) moved to Illinois, from Jonathan Fry, who "came out from Pennsylvania, and told me Dan was making talking machines."

Upon being shown "Exhibits A to Q," inclusive, except "H," "J," "O" and "P," he testifies: "I never seen any that I know."

The only machines, however, which he appears to remember having seen at any time in the shop are faucets, an electric clock, and a shocking machine.

And it is further significant that the witnes did not know how to write, and was unable to sign his name.

He is contradicted, however,

First.—By his daughter, Mrs. Kate Young (D. S.-reb., 536), who testifies that he (Kaufman) told her about Drawbaugh's talking machine about 1869 or 1870; and,

Second.—By his son-in-law, William Young (*Id.*, 539), who testifies that he heard Benjamin Kaufman speak of Drawbaugh's talking machine "about 1871, or along there, at his home, close by the Gorgas school-house, near Eberly's Mills. * * * He said that Mr. Drawbaugh had invented a talking machine—a machine that you could talk in or talk through."

A. R. Keefer (C.Vol. 2, 1275), division operator of the Middle Division of the Pennsylvania Railroad, testifies that he has known Daniel Drawbaugh for some years, how many he does not know, but should think it is some seven years prior to the date of his deposition, which would make it March, 1876.. He testifies that on one occasion Drawbaugh showed him a telegraph instrument which worked without a battery. He thinks this was in a store near the railroad depot, or in a room in the immediate neighborhood. He has a faint recollection, but is unwilling to state positively, that Drawbaugh showed him the works of the electric clock at one time; that Drawbaugh came to his office on different occasions and got pieces of wire from him, and spoke to him about electrical matters, more especially things which pertained to what Drawbaugh had constructed, but that, to the best of his recollection, he never brought any electric speaking telephones to him, nor did he ever tell him that he was at work, or had been at work, upon any prior to the time when this suit was begun in 1880.

Although the witness, in his tenth answer, admits that it is possible that Drawbaugh did so, the earliest recollection, however, that he has that Drawbaugh ever told him anything on the subject was a remark that Drawbaugh made in the summer of 1881 (almost a year after this suit was begun).

It will be noticed that this deposition, if it proves anything, proves too much. If Drawbaugh could not have had, or was not likely to have had, or been at work upon electric speaking telephones, without the knowledge of this witness, then he could not have had any, or been at work upon any such telephones, prior to the summer of 1881, notwithstanding the fact that Drawbaugh's patent application was filed in July, 1880; and the further fact that a large number of complainants' witnesses have testified to seeing telephones in Drawbaugh's shop in 1876, 1877 and 1878.

George W. Kissinger (C.Vol. 1, 551) testifies that he resided and kept store at Milltown from some time in 1871 to about April 1, 1874; that during that time, although he was in the habit of going pretty often to Drawbaugh's shop, Drawbaugh did not show him, nor did he hear that Drawbaugh had any talking machine or telephone.

It appears from his cross-examination, however, that he is able to remember only a few of the machines which Drawbaugh is well known to have had at that period, and that he admits that he did not take much interest in Drawbaugh's contrivances at the shop whilst he lived there, and when pressed on cross-examination, admits that he cannot swear he did not hear people talk about Drawbaugh's talking machine during the time above mentioned, but only that he cannot recollect hearing anybody talk about it.

The intelligence and reliability of the observation and recollection of this witness may be judged from the fact that he describes Drawbaugh's galvanometer as "a weather-teller." (562 Cross-Q. 107.) His entire unreliability when called upon to testify upon other matters, is fully pointed out in the discussion of the ram testimony (Appendix "A").

He is contradicted, however, by

William Natcher (D. S.-reb., 149) who testifies (150) that he heard George W. Kissinger, who kept store at Milltown, speak of Drawbaugh's talking machine October 17, 1871, to August 9, 1872.

Cyrus Kissinger (C. Vol. 2, p. 1463), George Franklin Kissinger (C. Vol. p. 523), and John M. Kissinger (C. Vol. 1, p. 575), testify that they had their home with their father (George W. Kissinger), at Eberly Mills, from April, 1871, to April, 1874, and that during that time they were occasionally at Drawbaugh's shop and saw some of his inventions, but do not remember of seeing any talking machine there, nor of hearing that he (Drawbaugh) had any. The memory of George F. Kissinger does not appear to be good, and John M. Kissinger was but a lad of fifteen when he moved away from Eberly's Mills. The testimony of all three of these witnesses, so far as it relates to hydraulic rams, is discussed in appendix "A." They do not appear to have taken any special interest in Drawbaugh's inventions, nor to have been on intimate terms with him, nor to have been persons upon whom the talking machine would have made any particular impression if they had seen it.

Isaac D. Landis (C. Vol. 1, p. 606) testifies that on the the 3d of October, 1876, he visited Drawbaugh's shop in company with his brother-in-law, Rufus E. Shapley, for the purpose of seeing Drawbaugh's electric clock; that whilst there he saw "an instrument for speaking through called a telephone." When asked to describe it, he does so as follows: "My recollection of it is being made of tin—apparently a tin can—with a piece of bladder across the end of it, with a magnet attached to it in front of the bladder," and adds, "and also that he (Drawbaugh) said, in calling our attention to it, that this was to revolutionize the world. or words to that effect; that it was for the purpose of speaking through, carrying the sound of the voice." (Ans. 28.)

He further testifies (Ans. 29) that it was not in working order at the time, and identifies exhibit "B" as the instrument which he saw, and says that he saw no other.

He does not remember that Drawbaugh said he had spoken through the instrument, but admits that it might have been said to Mr. Shapley.

He testifies further that it had on it a magnet wound with insulated wire, and that Drawbaugh conveyed the impression to his mind that it was intended to take the place of the telegraph.

Landis and Shapley were jewelers, and had gone to Drawbaugh's shop for the purpose of seeing his clock, in which Shapley was contemplating taking an interest. It is not at all strange, therefore, that Drawbaugh should have omitted to show them his more improved talking machines.

Charles A. Landis (C. Vol. 2, p. 1069) testifies that he was at Drawbaugh's shop some time between March 31st and April 13, 1877; that Drawbaugh then and there showed him exhibits "B" and "F," telling him that they were talking machines, and he saw no others there. The story which he tells of Drawbaugh's explanation of exhibit "B" to him is simply incredible, as he would have us believe that Drawbaugh described it to him as a make and break transmitter, whereas throughout the case, with the exception of this deposition, it has always been assumed to have been a receiver. The witness, however, was quite young at the time, and probably failed to understand what Drawbaugh's explanation was, or, if he did understand, he has forgotten it. His attempt at reproduction of Drawbangh's statement with regard to the repetition of syllables by his talking machine, is another evidence of the entire unreliability os his memory, as also is his statement that exhibit "B" contained no electro magnet, notwithstanding the positive testimony of complainants' witnesses, Shapley and I. D. Landis, to the contrary.

Isaac Lloyd (C. Vol. 2, 1264) and

Frederick U. Worley (*Id.* 1551) testify that they visited Drawbaugh's shop together on the Saturday previous to February 13, 1878; that Lloyd had known Drawbaugh for a number of years, and had induced Worley to go along with him on that occasion for the purpose of seeing Drawbaugh's magnetic clock, and writing an article in regard to it for the Harrisburg Telegraph. This article was published in said paper, February 13, 1878. They saw a number of Drawbaugh's inventions at his shop at that time, but did not see his talking machines. He mentioned it to them, however, as they both testify.

They do not seem to agree exactly upon what Drawbaugh told them. Lloyd says: "To the best of my knowledge he (Drawbaugh) said that he was working on a telephone; that this telephone was worked in connection with an electro-magnet; that the sound produced a kind of 'back-lash;' that he intended to control it by some means that I can't describe to you now." Although he testifies that he had curiosity to see the telephone, and wondered how an electro-magnet could be connected so as to carry sound, yet he did not ask to see it, and Drawbaugh did not show it to him.

Worley testifies that Drawbaugh said, in speaking of the applications of magnetism, that he was experimenting for the transmission of sound, but that while he could produce sound, it was indistinct and confused, and he thought of remedying that by receiving the sound in a box to which he could apply the ear.

He says he cannot give all Drawbaugh's exact words, nor can he give any statements that he made about the talking machine in the exact words that he used, and he, on cross-examination, proceeds to state the substance of all he can remember that Drawbaugh said on the subject. "He had succeeded in transmitting sound, but when it was received in an open room the reverberation made the sounds confused and indistinct. He proposed to remedy that by receiving the sound in a small chamber or box, to which the ear would be applied."

He says further, that he got the idea from Mr. Drawbaugh that up to that time he had received the sound in an open room, and not in any kind of a box which could be applied to the ear, or to which the ear could be applied.

He states that the conversation on the subject of telephones was very brief, and that Drawbaugh did not show them any.

It is to be noted: *First*, That the object of this visit to Drawbaugh's shop was to see the magnetic clock and get materials for a newspaper article about it.

And, *Second*, That in attempting to give a loosely remembered conversation, which they did not at the time understand, they have stated what, on the face of it, is the merest nonsense.

Lloyd had made several previous visits to Drawbaugh's shop, which are commented upon in the main brief.

Davis Major (C. Vol. 1, 848) testifies that he worked for the Haucks at Drawbaugh's shop for about a month in the spring of 1874; that during that time he was in different parts of the shop, and once went with Daniel Drawbaugh into his private room where the latter showed him a clock and two small batteries with wires attached to it, but that Drawbaugh never showed him any talking machines whilst he worked in his shop, and never told him he had any, and he denies ever having seen anything like the exhibits which are shown him, A, B, C, D, E, F and I.

On cross-examination, however, the witness admits that his memory of events was not reliable, and testifies that, in addition to the clock and batteries, he saw in Drawbaugh's private room other things which he calls "rubbish and stuff"—what it was he did not know; that his own work was on the first floor of the building, and that he knew Daniel Drawbaugh was working on the second floor, but did not know what he was working at.

His testimony is further commented upon in the main brief.

James P. Mathews (C. Vol. 1, p. 540) testifies that in April, 1878, he made a visit to Drawbaugh's shop for the purpose of getting material for a newspaper article on Drawbaugh's magnetic clock; that Drawbaugh at that time did not talk to him through any telephone, nor did he see any telephones there completed in working order. It appears, however, that Drawbaugh showed him what witness describes as two wooden hemispheres with pieces of loose wires attached; and further, that Drawbaugh claimed to him to have invented the telephone before either Bell or Edison. Witness states that he got the *impression* from the conversation of Drawbaugh that the latter had entirely thrown aside his telephone experiments;

but he is contradicted in this by complainants' own witnesses, to wit: Shaply, I. D. Landis, C. A. Landis, Olando Kaney, A. L. Rupp, George C. Rupp, Henry R. Mosser and Theodore Grissinger; his recollection of the conversation with Drawbaugh being evidently inaccurate.

Henry R. Mosser (C. Vol. 1, 366) testifies that he wrote a letter to the "Baltimore American," from New Cumberland, Pennsylvania, dated January 31, 1878, in which letter he made mention of Daniel Drawbaugh's electric clock; that shortly before that time he had visited Drawbaugh's shop, and had seen there some electric clocks; and that he had a conversation with Mr. Drawbaugh about an electric speaking telephone, which he states as follows:

Q. 10. Will you state the substance of that conversation?

Ans. My recollection is that he showed me some parts or work that "he said he had been working upon for *some time previous*."

Drawbaugh did not, however, state how long he had worked at them; and witness does not think he said whether he had given up working at them, or abandoned them, or anything in relation to that subject. He frankly admits that he may have heard that Drawbaugh had electric speaking telephones before that time, but he does not remember.

He seems unable positively to identify any of the instruments shown him, and testifies as follows:

Q. 17. * * * * * *

"A. I think I recognize that ['B'] as one or something like one he showed me.

"Q. 18. Do you recognize these two large ones ['H' and 'J']?

"A. I have no recollection of seeing them.

"Q. 19. I now show you all the other original instruments which have been put in evidence by the defendants, and ask you which, if any of them, you saw at that time?

"A. *Mr. Drawbaugh showed me several parts of his telephone, only one of which I definitely seem to remember—that is this one (indicating) 'B.'*"

He further testifies (Ans. 53) that "the conversation on telephones was very brief."

George W. Mumper (C. Vol. 2, 1098) testifies that he lived about a mile and a quarter from Eberly's Mills twenty-eight years, and has known Daniel Drawbaugh twenty-five years; that on Sunday, March 3, 1878, he took his two nephews, George W. Heiges and Mumper J. Bailey, to Drawbaugh's shop to see "the clock that Mr. Drawbaugh had invented, that was to run without winding;" that on their arrival at the shop they asked Mr. Drawbaugh to show them the clock, which he did, and he explained it to them; that Mr. Drawbaugh did not at that visit say anything about telephones or talking machines, nor did he show them any.

Upon being shown Exhibits "A" to "Q," inclusive, he denies ever having seen them at Drawbaugh's shop.

He further testifies that if Drawbaugh had had in his shop a telephone or talking machine six or eight years, and had shown it to a dozen or twenty people, it would have become known in the community.

And further, if it had been generally known in the community, he (Mumper) would have known it, but that he had never heard that Drawbaugh had any such telephone or talking machine up to the date of his visit (March 3, 1878).

He further testifies that if Mr. Drawbaugh, long before speaking telephones were heard of elsewhere, had had at his shop a talking machine by which conversation could be carried on from one place to another along a wire, and had represented that there was a fortune in it, and that it was going to supersede the telegraph, and had demonstrated its usefulness by actual practical use by various persons, and had desired to obtain a few hundred dollars to patent it, offering to give a half or other part interest to those who would furnish the money; that Drawbaugh would have been able to obtain it from his acquaintances or people in the neighborhood; that he (Mumper) would have been willing himself to endorse for Drawbaugh to enable him to raise the amount of fifty dollars.

He further testifies that Alfred Ditlow worked for him five months in 1872, and again in 1876.

On cross-examination, he fails to remember the fact that Daniel Drawbaugh had applied to him for the loan of a small amount of money, and was refused.

He is contradicted by

First.—Joseph Ditlow (D. S.-reb. 521), who testifies (524), that several weeks prior to the time when Mumper gave his deposition, the latter told him that Drawbaugh had his telephone in 1874.

Second.—By Abraham Ditlow (*Id.* 876), who testifies (882) that at the time above fixed by Joseph Ditlow, Mumper said to Joseph Ditlow and himself that he thought it was strange, when he heard they were in Philadelphia and had testified against Drawbaugh; that he "had been up in Daniel Drawbaugh's shop in 1874, and had seen the talking machine, and Dan wanted me to go in partnership with him, and he said 'he was a d—n fool—if he had gone in with Dan he would have made his fortune.'"

Third.—By Alfred Ditlow (*Id.* 820), who testifies that during the year he painted Mumper's barn (1876), Daniel Drawbaugh came into the field at Mumper's and "called Mr. Mumper aside; then Mr. Mumper came up to me, and I asked him what Mr. Drawbaugh wanted, and he said he wanted to borrow some money. Mr. Mumper told him he hadn't the money to spare."

And see the comments upon the testimony of Bailey and Heiges, *supra.*

Michael H. Natcher (C. Vol. 1, 510) testifies that he worked for his father whilst the latter ran the grist mill at Eberly's Mills in 1870 and again in 1871-72; that during that time he was often at Drawbaugh's shop, and saw him (Drawbaugh) every day that he (Drawbaugh) was about home.

He further testifies that he never saw anything like exhibits "B," "F," "C," or "I," and that Drawbaugh never showed him, or spoke to him of any talking machine whilst he (Natcher) lived at Eberly's Mills.

He further testifies that Drawbaugh showed him some few things at his shop, but was able to mention particularly only his faucet and clock.

It will be observed that he was not asked on his direct examination whether he had ever heard of Drawbaugh's talking machine whilst living at Eberly's Mills, and cross-examination was waived.

He was recalled by defendants (S.-reb. 135), and testified that it was true, as he had said in his first deposition, that he had never seen any of Drawbaugh's talking machines whilst residing at Eberly's Mills, but that he had then and there heard of them, and he names four persons whom he recollects of hearing speak about Drawbaugh's talking machine: his brother, George Natcher, his sister, Bella Natcher, his mother, Emiline Natcher, and George Leonard—and he further testifies that there was talk about putting up a talking machine between the grist mill and his father's house.

He is corroborated by his sister, Mrs. Blanche Bella Spangler (*Id.* 176), who remembers of having heard of and seen Drawbaugh's talking machine whilst living at Eberly's Mills, and by his mother, Emiline Natcher (*Id.* 174), who testifies that she heard her son Michael speak of Drawbaugh's talking machine; that it was well-known in their family, and was a good deal talked about in the community.

He further testifies that he told complainants' counsel when the lattter came to see him about his knowledge of Drawbaugh's talking machine, that he had not seen it, but had heard of it whilst living at Eberly's Mills.

An attempt was made to contradict him by the deposition of George Leonard (C. Vol. 3, 2297), who testifies that he never spoke to either of the Natchers, or any other person, about a talking machine, or about putting one in from the mill to the house.

The reason, however, which he gives for this denial is that he knew nothing about the talking machine at that time. But, on cross-examination, it appears that he assumed the time to which Michael H. Natcher's testimony referred to be the first year which he (Leonard) owned the grist mill. (February, 1871, to February, 1872.)

But this assumption was entirely unwarranted by anything contained in the testimony of Michael H. Natcher, and Mr. Leonard further admits that he merely has no recollection about the matter, and does not know that he ever heard anything about the talking machine whilst the Natchers were with him.

William Natcher (C. Vol. 1, 500) testifies that he ran the grist mill at Eberly's Mills, Eberly and Betem from April 1, 1870, to September 5, 1873, and again for George

Leonard from October 17, 1871, to August 9, 1872; that during these two periods he was sometimes at Drawbaugh's shop, as he describes it, "not so very often, but I was frequently there."

He further testifies that Mr. Drawbaugh never showed him any talking machines, and never told him he had any whilst he lived at Eberly's Mills.

On cross-examination he is able to mention four machines or inventions which Drawbaugh showed him or talked to him about during the periods above stated, namely the faucet, hydraulic ram, nail machine and cider machinery, and he omits to mention the electric clock which his son, Michael H. Natcher (C. Vol. 1, 510), called immediately after, remembers to have seen.

He is contradicted by his son, George Natcher (D. S.-reb., 143), who says that whilst living at Eberly's Mills he heard Drawbaugh's talking machine spoken of, and particularly states that his "father (William Natcher), Mr. Drawbaugh and mother (Emiline Natcher) were talking about them."

And, further, that Mr. Drawbaugh and Mrs. Natcher wanted William Natcher to have a talking machine or telephone put up between the house and the mill, but he never had it done.

William Natcher himself, upon being recalled by defendants, testifies (149) that after he had given his deposition on behalf of complainants and returned home, he received through the mail, from John C. Comfort, one of of complainants' agents, a printed copy of his deposition, which he read, and that having read it and reflected further upon the subject. he remembered that he had had heard Drawbaugh's talking machine spoken of whilst he lived at Eberly's Mills. He was then able to mention the names of nine persons whom he had heard speak of it, and testified further that "it was generally spoken of in the little village, or whatever you may call it, of Milltown that Daniel Drawbaugh had a talking machine by which he could communicate from one place to another." And further, that the subject of putting up one of Drawbaugh's talking machines from the mill to his (Natcher's) house was spoken of.

Henry Neidig (C. Vol. 2, 1520) resided on Lake Spring farm, about a mile from Milltown, from the spring of 1870, to the spring of 1877. He employed Daniel Drawbaugh to put in a hydraulic ram on said farm in 1871, and employed him subsequently to do several jobs of work there for him, on which occasion and several other times Drawbaugh was at his farm.

He testifies that up to the spring of 1877, Drawbaugh never told him that he had a talking machine, or asked him to put money into it to help him patent it, and that he never heard prior to that time that Drawbaugh had a talking machine or telephone; that if, before electric speaking telephones had been heard of elsewhere, Drawbaugh had told him that he had talking machines which worked by electricity, and by means of which conversation could be carried on between one place and another, along a wire, and had demonstrated to him that he (Drawbaugh) had such a thing in a really successful condition by having him talk and listen through it, and had pointed out to him that there was a fortune in it, and had told him that he wanted fifty or one hundred dollars to patent it with, and would give an interest in it to anybody who would furnish the money, he (Drawbaugh) would never have had any difficulty in getting the money or a considerable part of it from witness.

But it is not shown that the witness was ever at Drawbaugh's shop. It does not appear that he had any knowledge of any of Drawbaugh's inventions; that Drawbaugh was on terms of any particular intimacy with him, or that the witness was a man capable of understanding or appreciating the talking machine if Drawbaugh had called his attention to it, and explained it, or had even commended it in the strongest terms. And, moreover, the witness' testimony as to what he would or would not have done in the case supposed, is a mere idle expression of opinion concerning circumstances which it is impossible for him fully to realize at the present time—particularly since the commercial value of electric speaking telephones has been demonstrated.

Complainants' attempt in the deposition of this witness another and a startling method of contradicting defendant's witnesses. Henry Herr, Ira D. and Norman W.

Kahney had testified on behalf of defendants, that they had seen talking machines at Drawbaugh's shop at early times. It appeared that Henry Herr was a relative and friend of the witness, and that they were in the habit of meeting more or less frequently from 1871 to 1875; that the Kahneys had both worked for witness on his farm prior to 1877—Ira, about six months, at different times, and Norman considerably less.

Witness is asked to testify, and does testify, that neither of these persons ever mentioned Drawbaugh's talking machines to him.

The inference, which complainants undoubtedly intended the court to draw, being that if these persons had known anything about Drawbaugh's talking machines, they must have mentioned the subject to witness; and thus complainants seek to contradict their sworn testimony that they *did* see Drawbaugh's talking machines.

His testimony is further commented upon in the main brief.

Jacob Neidig (C,Vol. 2, 1235) lived within a mile or two of Eberly's Mills from the spring of 1870 to the spring of 1877. From the spring of 1870 to the fall of 1874 he was at Drawbaugh's shop a good many times; from the fall of 1874 to the spring of 1876 he was there, but not so often as before; from the spring of 1876 to the spring of 1877 he was there, but seldom.

On cross-examination he fails to remember any visit after the beginning of 1876.

He testifies to having seen a number of Drawbaugh's inventions at his shop, but says he never saw any talking machines there, and never heard of any down to the spring of 1877, and he thinks it likely that if there had been any talking machines at Drawbaugh's shop prior to the spring of 1876, he would have known of them and seen them.

It appears, however, that when his more frequent visits ceased in the fall of 1874, he was a mere lad of seventeen years old, and no special opportunity is shown for seeing all of Drawbaugh's inventions.

J. C. Nesbit (C.Vol. 1, 687) testifies that in the summer of 1878, he was employed to write a sketch of Lower Allen township for a history of Cumberland county, Pa., by Rev. Conway P. Wing and others, and published by Jos. D. Scott; that R. P. Hull, then living at Lisburn, was employed to assist to gather information concerning the township, and furnish it to witness; that in pursuance of this engagement he and Hull went to Eberly's Mills between the 1st and 15th of August, 1878; that after having talked with other residents of the place, they went to Daniel Drawbaugh's shop to see and get information from him; that they remained in said shop about an hour, about half of which time witness remained conversing with Hull and Drawbaugh, and during the remainder of that time he walked around the shop whilst Hull and Drawbaugh remained in conversation; that Mr. Hull wrote notes of what he learned that day from Mr. Drawbaugh, and others at Milltown, and when they arrived home at Lisburn just before they separated that same day, Mr. Hull handed the paper to him. He is under the impression that the part of the paper which relates to Mr. Drawbaugh's shop was written at the shop, inasmuch as he and Hull went home together, and he (witness) knows that he (Hull) did not write any on the way home; that he (witness) the same evening wrote out from those notes an article which he sent to the *Herald* office at Carlisle where the history was being printed, and which subsequently appeared in the history; that Mr. Drawbaugh did not tell him, or say in his hearing on that occasion that he claimed to be the first inventor of the speaking telephone.

Complainants produce a copy of said history of Cumberland County, and spread upon the record the article entitled "Milltown or Eberly's Mills," in which Daniel Drawbaugh's shop is spoken of and his measuring faucet and electric clock are mentioned. They also produce and offer in evidence the original notes which Hull gave to the witness on the day of their visit to Drawbaugh's shop (witness testifies that Hull died in April or May, 1879), about half of which are devoted to Drawbaugh's shop, and mentions several of his inventions, to wit: the faucet and electric clock, but makes no mention of his telephone.

On cross-examination, however, it appears that some copies of said history of Cumberland County contain an appendix made up of biographies of prominent persons living throughout the county, whilst others do not contain said appendix. The copy produced by complainants' counsel did not contain said appendix, and notice was given to them to produce a complete copy of said work.

It further appears on cross-examination that complainants had been in search of another paper supposed to have been among the effects of Mr. Hull, containing a biographical sketch of Daniel Drawbaugh, but which they had failed to secure. A paper was then produced by defendants, which was identified by the witness as being in the handwriting of R. P. Hull, and which appeared on comparison with the other manuscript produced, to be written on the other half of the same sheet of paper. Said manuscript appeared to be a biographical sketch of Daniel Drawbaugh, and set forth among his other inventions several kinds of telephones, magneto and voltaic.

At a subsequent session, complainants' counsel produced a complete copy of said history of Cumberland County, which contains a biographical sketch of Daniel Drawbaugh manifestly made from the sketch written by Hull, and like it containing a statement of the invention of several kinds of telephones by Daniel Drawbaugh.

And thus by reason of the fortunate possession of the Hull manuscript by defendants, this attempt on the part of complainants to prove a negative, whilst they had in their hands positive testimony to the contrary, failed.

Edward M. Nichols (C. Vol. 1, p. 852), testifies that he worked for the Haucks at Drawbaugh's shop in 1874; that he saw a number of Drawbaugh's inventions there at that time, but did not see among them any talking machines, nor did he know that Drawbaugh had any there at that time; that he doesn't think that Drawbaugh could have had a talking machine there, and been in the habit of showing it to others at that time, without his (witness) knowing it, and that, if he had known it, he doesn't think he would have forgotten it.

He is contradicted, *First*, by his sister, Mrs. Annie M. Reynolds (D. S.-reb., p. 612), who testifies that she heard her brother, Edward M. Nichols, speak of Drawbaugh's talking-machine in 1874, whilst he (Nichols) was working for the Haucks, and that he said he had seen it at Drawbaugh's shop.

And *Second*, by his mother, Mrs. Leah Nichols (D. S.-reb., p. 731), who testifies that she heard her son (Edward M. Nichols), whilst he was working for the Haucks, say that Drawbaugh was making a talking-machine, or something to talk through,, and that she frequently heard him and his father, Samuel Nichols, one of defendants' witnesses (see D.Vol. 1, p. 238), speak about it.

C. W. Pike (C. Vol. 2, 161) and

Jacob G. May (C. Vol. 2, 1563) were together at Drawbaugh's shop in the fall of 1878, and spent about two hours there, the former testifying that he did not see any talking-machines there, and that he cannot remember and has no recollection of anything being said about them; whilst the latter identifies "Exhibit A," and says that "Exhibit F" seems familiar, and his impression is that he saw it at Drawbaugh's shop. His impression also being that he saw "A" there when he and Mr. Pike were there together, and he further admits that he may have seen "Exhibit H" or "C," but does not remember of having done so. With regard to "D," "E" and "A," he cannot positively say that he has seen them.

George W. Row (C. Vol. 2, 1533) testifies that up to the spring of 1876 (when he was about fourteen years old) he had always lived at Eberly's Mills; that during that year he worked as a hireling for John H. Stephens, who had testified on behalf of defendants (D. Vol. 2, 260); that in October, 1876, the latter told him he had been down at Drawbaugh's shop the night before, and that Drawbaugh had then told him that he was making a talking-machine to talk from one place to another by a wire.

Complainants endeavored to get the witness to say that Stephens further told him that he first knew of Drawbaugh's talking-machine upon the evening referred to, and partially succeeded, by means of an artfully worded question, but upon cross-examination he admits that Stephens did not tell him whether or not he had seen Drawbaugh's talking-machine long before the evening referred to, nor whether or not that was the first time Drawbaugh had spoken to him about the talking-machine.

It was, however, meant by the complainants as an attack upon Stephen's testimony, and they were endeavoring by their use of negative and inferential evidence to show that Stephens was mistaken in his dates, and defendants felt called upon to meet it, which they did by the testimony of Henry Otstot (D., S.-reb., 360), who testifies that he was twice in Daniel Drawbaugh's shop at Eberly's Mills, the last time on the day of George Heck's sale, which took place September 13, 1873 (see John B. Heck, D. S.-reb., 893); that upon that occasion he did not see any talking machines, but that he had been there in company with John H. Stephens several years before in the fall of either 1870 or 1871, when he did see a talking machine there, and he identifies Exhibit "C" as one which he then and there saw.

It thus appears that John H. Stephens, instead of testifying too strongly for defendant, as complainants endeavored to make it appear, had testified in a very guarded manner, and had abstained from fixing his dates as early as he might have done.

Abraham L. Rupp (C, Vol. 2, 1111), testifies that he lived on Lake Spring farm, about a mile and a half from Milltown, up to the spring of 1870, when he moved to Shiremanstown, and lived in and about that place until the spring of 1877, when he returned to Lake Spring farm.

He appears to have bought a fodder cutter December 3, 1877. He testifies that soon after he purchased it, and during the winter of 1877-8, he went to Drawbaugh's shop to grind the knives belonging to it, and that Daniel Drawbaugh then and there talked to him through his talking machine. He does not remember what led Drawbaugh to show it to him, nor what conversation he and Drawbaugh had about it, but merely that Mr. Drawbaugh took him downstairs (he thinks into the basement), and that he there put his ear close to the machine at which he listened, and which he thinks was resting on a table or bench, and thus heard Drawbaugh talk.

He testifies further that he had heard Mr. Drawbaugh speak through it, but that he has no recollection of seeing the instrument into which Drawbaugh talked. Upon being shown Exhibits "A to Q," inclusive, all the original instruments offered in evidence—he is unable to identify any of them, and says he has no recollection of seeing any of them, and further, that none of them looked familiar to him. (Cross-Ans. 79.)

He testifies that he never had heard before that time that Drawbaugh had a talking machine.

He further testifies that he does not know where Drawbaugh was when he talked; that he might have had some idea at the time where he was, but has no recollection now; that he did not ask Drawbaugh, and he doesn't know how the telephone was operated; and that he didn't take any more interest in the matter than merely "to listen at one end of it."

Having taken so little interest in the matter, and having such a dim recollection of what he did see and hear, it might be supposed that complainants would have refrained from calling upon him to express any opinions upon it; but they did not, and he was made to testify that, if Mr. Drawbaugh had had at his shop for six or eight years before his visit a talking machine by which people at different places could talk to each other along a wire, and had been in the habit of freely communicating knowledge of it to the public, and showing it generally to people at his shop, he thinks he, too, would have known it.

And, further, that if Mr. Drawbaugh, for five or six years before speaking telephones were heard of elsewhere, had at his shop a talking machine by which people at different places could carry on conversation with each other along a wire, and had freely shown it to people, and had them carry on conversation over it, so that they knew it would do what he claimed for it, and had represented that it was going to supersede the telegraph, and that there was a fortune in it, and that he was ready to give a part interest in it to whoever would provide a few hundred dollars to patent it and start making the instruments, in his opinion he (Drawbaugh) would have been able to raise the money in the neighborhood.

His testimony is further commented upon in the main brief.

George C. Rupp (C. Vol. 2, 1122) testifies that he lived in the neighborhood of Eberly's Mills up to January, 1881, with the exception of the year, 1876, when he was in Indiana: that prior to the spring of 1877, he had been at Drawbaugh's shop at Eberly's Mills some, but not as much as after 1877; that in the winter of 1877, 1878, he went there for the purpose of sharpening knives on a fodder-cutter, and that Daniel Drawbaugh then and there showed him his talking machine and talked through it to him, and that he heard Drawbaugh speak through it.

He thinks, although he is uncertain, that the instrument he saw had the mouthpiece on one side, instead of at the center, and picks out exhibit "A," as the one most nearly resembling it. He testifies that he had never seen any talking machine at Drawbaugh's shop before that time, and had never heard that he had one.

Upon cross-examination he inclines to say that he was never in Drawbaugh's shop at any time within five years before December, 1877.

His testimony is further commented upon in the main brief.

William Sadler (C. Vol. 1, 1036) testifies that he has lived within a mile and a half of Drawbaugh's shop at Milltown since 1836; that he was connected with the Millbush Company which had considerable work done by the Drawbaugh Manufacturing Company, that from about June, 1868, until some time in 1869, he was in the habit of going to Drawbaugh's shop at Milltown to look after the work; that he had been during that time in Drawbaugh's private office; that he was at Drawbaugh's shop again in the latter part of June, 1876, on business, and at other times between the beginning of 1868, and the summer of 1876; that Drawbaugh never showed him a talking machine, and never told him he had one; nor did he ever know that Drawbaugh had a talking machine before the year 1880.

Complainants in this deposition attempt a remarkable piece of inferential testimony. The witness testifies that his son, Jacob M. Sadler, was in partnership with Daniel Drawbaugh from, he thought, some time in 1871–72, he didn't recollect which, in the business of putting in hydraulic rams, and during that time his son lived at home with him, yet he never heard his son say anything about Drawbaugh's telephone until some time in the fall of 1880. (Jacob M. Sadler died December, 1880.)

Witness further testified that Drawbaugh "could not have had speaking telephones at his shop from 1869 to 1876, and been in the habit of showing them to people generally, who came in, and communicating knowledge of them freely to the public during those years without "his knowing it" (*Id.* 1045, Ans. to Q. 43); and substantially (*Id.* Q. 44) that he could not have heard of Drawbaugh's telephone and forgotten it.

On cross-examination he testified that whilst his son was in the ram business with Mr. Drawbaugh, about 1871, he had good opportunities for seeing and knowing of Drawbaugh's talking machine if it existed at the time. And, further, that if his son had known anything about it he would have mentioned it to him, and that he (Wm. Sadler) could not have forgotten it if he had heard of it. (*Id.* 1049, Cross-Q. 110 to 113.)

Defendants then produced the affidavit of J. M. Sadler, taken a short time before his death, which is as follows (C. Vol. 1, 1050):

"Cumberland County, *ss.*

"Before me, the subscriber, a justice of the peace in and for such county, personally appeared J. M. Sadler, who, being duly affirmed, says: In the year 1871 I was engaged with Daniel Drawbaugh in the manufacture and sale of hydraulic rams. At that time, to the best of my recollection, he spoke to me about his talking machine. He showed it to me, but I don't remember what it was like. I know there were two machines connected by wires. He spoke through it to me, and I understood distinctly the words he said. I repeated to him the words he spoke, and he said they were right. I recognized the voice as his; it sounded like his, I remember that distinctly. He said his invention would take the place of telegraphing, and that it could be used to speak at long distances.

"In the manufacture of hydraulic rams I furnished the capital, and Drawbaugh made them. He was poor at that time and generally hard up.

"J. M. SADLER.

"Affirmed and subscribed before me, this thirtieth day of June, 1880.

"JOHN F. LEE, J. P."

The witness was disposed to deny his son's signature, but the signature and the execution of the affidavit were subsequently proven by the justice. (See Lee D. S.-reb., 211). And the fact that Jacob M. Sadler well knew of Drawbaugh's talking machine, was proven by John F. Keepfauver (D. S.-reb., 837) who testifies (841 *et seq.*) that he and Jacob M. Sadler went together to Drawbaugh's shop in April, 1873, and talked through the talking machine from the attic to the cellar, and by Benjamin F. Zimmerman (*Id.* 822), who testifies (823, Ans. 8, 9) that at the time Jacob M. Sadler was engaged with Drawbaugh in the ram business, he heard him (Jacob M. Sadler) say "that it was no use to try to do anything with Dan Drawbaugh for that he was always working with that d—n talking machine."

William Sadler is contradicted by

Jacob Barber (D. S.-reb., 371) a man of very high standing in Cumberland County, who served eight years as one of the commissioners of said county, and filled other public offices, and who testifies (*Id.* 374, Ans. 18 to 21) that he heard William Sadler speak of Daniel Drawbaugh's talking machine several times whilst he (Sadler) was also commissioner (1876 to 1879), and by B. F. Zimmerman (*ut supra*), who testifies that he heard William Sadler speak of Drawbaugh's talking machine some time between 1868 and 1873, at a public sale in Milltown, the exact date of which he is unable to fix.

Rufus E. Shapley (C. Vol. 1, 587) testified that he went to Drawbaugh's shop, October 3, 1876, in company with his brother-in-law, Isaac D. Landis, for the purpose of seeing Drawbaugh's electric clock; that whilst there they saw lying on a table near the clock an instrument which Drawbaugh called a telephone. He identifies Exhibit "B" as said instrument. He says that he "understood Mr. Drawbaugh to say that he had it up around the shop," and in his 28th answer, "I think I understood Mr. Drawbaugh to say that they had spoken with it, but I don't remember that he made any remark of any use that would thereafter be made of it." He does not remember to have seen any other telephone instrument there, but he says they were only on one floor of the shop, and that their time was limited (Ans. 21), and again, "our time was very short there" (Ans. 32). He testifies further that he was at that time contemplating taking an interest in the clock, and the purpose of his visit was to examine it with regard to that object.

Theophilus Weaver (C. Vol. 1, p. 376) testifies that he was at Drawbaugh's shop on several occasions from 1867 to 1876, and there saw a number of Drawbaugh's inventions; that he met Drawbaugh elsewhere a number of times during that period, and conversed with him about various inventions; that during that time Drawbaugh never told him he had a talking machine, or exhibited to him any such machine; that in May, 1878, when Weaver was employed as solicitor to take out a patent upon Drawbaugh's magnetic clock, in a private interview the latter first told him about his talking machine. The attention of the court is particularly directed to the language in which Weaver relates this interview. "in one of those private interviews," *then he alone being present with me*, he stated he too had experimented on the electric telephone years ago, *and before Bell came out with his invention*, and that he had some results, but that they were not of such a satisfactory nature as to go ahead at the time with his experiments; that he had given up his experiments for the time being, and now it was too late for him to hope to have any standing as the inventor of the electrical telephone (Ans. 90), and that he had nothing to show how far he had gone in his earlier experiments. (Ans. 95 and 313.) He states that the *impression left upon his mind* was that Drawbaugh obtained no good results from those early experiments, because country people ridiculed him so much about it, and that he (witness) *thought* that if he (Drawbaugh) had obtained any satisfactory results that country people would have applauded him; he testifies that it is his impression from the conversation of Drawbaugh that he (Drawbaugh) was working on a talking machine a good while, and that he understood that his (Drawbaugh's) experiments were before Mr. Bell came out with his telephones, and that he (Drawbaugh) had experimented a good deal. He did not, however, specify what his experiments were, and witness did not ask him what they were. Drawbaugh did not tell him when he first went to work at telephone experiments, but said it was long ago, and said that his crude experiments were before Bell came out—a good while before Bell came out, although the date of Bell's patent was not mentioned. (Ans. 524–525.)

Witness did not ask Drawbaugh what his results were, but says that Drawbaugh told him that he had given his telephone experiments up, because they were not fairly practical and successful, and because he was ridiculed by the country people. He states that it is his *impression* that Drawbaugh told him he was much opposed and laughed at by the people; that his experiments were not altogether successful; that he had some results when he gave it up; that he did not go far enough, but that he still could get up and patent some improvements (Ans. 495–533). The witness, however, mixes up Drawbaugh's telephone and clock experiments to such an extent as to render it almost impossible to separate them. He mingles his impressions and opinions with Drawbaugh's statements in such a way that it does not clearly appear what Drawbaugh did say to him. His deposition is a long one, covering 125 pages, and it is not proposed to give it here at length. In his cross-examination he seriously damages his testimony in several respects. First, by his contradictory statement (and it is impossible within the limits of this brief to even refer to them). Second, by his admission that he was the paid agent of the complainants, who had early in the case sought him out as a person likely to aid them; and third, by his admission that he had on several occasions shown great hostility to Drawbaugh.

His cross-examination throughout showed that he was a man of great vindictiveness and unscrupulousness, and that smarting under slights which he imagined himself to have received, he had on several occasions attempted to injure Drawbaugh and his associates, and to prevent the manufacture and sale of Drawbaugh's inventions, and that he had desisted from such conduct when threatened with legal proceedings. It is impossible to read his cross-examination without being impressed with his hostility to Drawbaugh, and the general low tone of his character and conduct.

Indeed, so far did he discredit himself that the complainants considered it necessary to bolster up his character and conduct in an irregular manner by proof, not of his general good reputation for honesty and truthfnlness, but that he had acted honestly on several occasions.

As to his statement that Drawbaugh had nothing to show for his earlier experiments, see remarks on Theodore Grissinger, *supra*.

James C. Zimmerman (C. Vol. 1, p. 622) testifies that he lived at Eberly's Mills about six or eight months in 1871, and in its vicinity for a year or two longer; that during that time he was at Drawbaugh's shop "only a few times"; that he saw some of Drawbaugh's inventions there, but to the best of his knowledge, did not see any talking machines, nor did Drawbaugh tell him that he had any such machines. It is not necessary to comment on this testimony, as it does not appear that Zimmerman had any special opportunities for seeing the talking machines, and he seemed unwilling to say positively that he had no knowledge of them. After the lapse of a year from the close of their rebutting testimony, complainants having been able to find three more witnesses who knew nothing of Drawbaugh's talking machine prior to 1880, called in their rejoinder, John Kahney, Simon C. Wilson and George Ditlow.

John Kahney (C. Vol. 3, p. 2,033) testifies that he lived at Eberly's Mills from the spring of 1871 until the spring of 1875, since which time he has lived within a mile of that place; that whilst living there, and since he moved away, he has frequently been in Drawbaugh's shop, and has seen different inventions there, but that he never saw there any talking machines, and never knew that Drawbaugh had any until he was told by his son that Drawbaugh "had sold out his interest in the telephone to the Telephone Company," and this he says was that after the spring of 1879. (The sale of Drawbaugh's interest in the telephone occurred in July, 1880 (C. Vol. 1, p. 101.)

The deposition of this witness proves too much, inasmuch as if it proves that telephones were not at Drawbaugh's shop before 1876, it also proves that they were not there after that date.

Three sons of this witness, Ira, Norman W. and Augustus Kahney, had testified in behalf of the defendants that they had seen talking machines at Drawbaugh's shop prior to 1876; and the fourth son, Orlando B. Kahney, had testified, when called by complainants, that he knew of Drawbaugh's talking machine in the fall of 1876, and subsequently, when recalled by defendants, that he saw and talked through a talking machine at Drawbaugh's shop in July of 1875.

To contradict these witnesses, John Kahney was asked by complainants whether he had ever heard Drawbaugh's talking machine spoken of in his family, to which he replied that he never had until told that Drawbaugh had sold it. The extremely far-fetched inference which, no doubt, complainants wish to draw from this testimony is entirely destroyed by the fact that witness' son Orlando had already testified, when called by complainants, that he knew of Drawbaugh's talking machine in the fall of 1876.

Simon C. Wilson (C, Vol. 3, p. 2,058) testifies that he was at one time a telegraph operator, and had charge of a small telegraph repair shop belonging to the Northern Central Railroad Company, at Harrisburg, Pa., from December, 1870, to the latter part of 1876 or 1877; that on several occasions Drawbaugh came to said shop, and was allowed to have telegraphic material from the scrap pile; that Drawbaugh at one time showed witness an electric clock, and at another time an instrument for telegraphing without a battery; but he never showed him any talking machine, nor told him that he had invented such a machine. A number of hypothetical questions were put to this witness by complainants, who sought to show that if Drawbaugh had had a talking machine, for example, in 1873, that J. D. Cameron, the president, and J. N. DuBarry, the general superintendent of the Northern Central Railroad Company, would have taken half of it. Witness testifies that he feels satisfied "*that when they came to understand the invention* they would have gone into it."

Complainants considered it important to put upon the record the fact that the full name of this witness is Simon Cameron Wilson. It does not, however, appear that this witness was ever at Drawbaugh's shop, or that he had been on any particular terms of intimacy with Drawbaugh, and certainly his opinion as to what Drawbaugh and others would or would not have done under certain circumstances is not entitled to any weight.

George Ditlow, (C. Vol. 3, p. 2,122) testifies that up to 1875 he lived at Eberly's Mills, and was accustomed to go there frequently to the post-office and store; that he knew most of the people at Milltown, but that he never heard, whilst living there that Daniel Drawbaugh had a talking machine.

APPEALS FROM THE CIRCUIT COURT OF THE UNITED STATES FOR THE SOUTHERN DISTRICT OF NEW YORK.

OPENING BRIEF FOR APPELLANTS ON THE DRAWBAUGH EVIDENCE.

It is conceded that the earliest and latest machines claimed by the defense to have been conceived and constructed by Daniel Drawbaugh, which did transmit articulate speech, operated on the principle which has been applied under the Bell patents.

The principle is, that of transmitting articulate speech upon wires by a continuous electric current, with the addition of means to cause incidental undulations of the current corresponding with the incidental tones of the human voice.

When applied in the electric speaking telephone the practical result is, that the same air vibrations set in motion by the human voice, and producing sound by their impact upon the tympanum of the ear, are repeated with comparative exactness upon the tympanum or diaphragm of the transmitting instrument, are then by the process carried to a distance, and there with equal exactness repeated upon the tympanum or diaphragm of the receiver, and thence again repeated upon the tympanum of the listening ear.

THE ISSUE.

At the beginning and the end of the controversy, through the entire mass of learning and material accumulated on either side, appears and runs the single question:

Did Alexander Graham Bell or Daniel Drawbaugh first conceive and apply this principle, and 'clothe the conception in substantial forms which demonstrated at once its practical efficacy and utility?'

This court has clearly laid down the lines within which legal evidence can solve the question in favor of Drawbaugh.

Extended citations are unnecessary, because the rules settled by judgments in two leading cases applying here, have never been departed from or varied. These are the Fire Proof Safe case and the Reversible Lock case.*

In the former, Connor was a business man, and constructed for himself a safe, containing metal walls with plaster-of-paris between. He used it in his own business only, and finally, selling out, the safe disappeared. He never applied for a patent, and never made another safe; neither did he communicate the knowledge of its construction to the public. Of course, such was its construction that a person seeing it could derive no information in respect of construction, the patentability of which was in issue. There was no evidence that Connor had ever tested the safe, to see whether or not it was fire-proof.

---

*Gaylor v. Wilder, 10 How. 477; Coffin v. Ogden, 18 Wall. 129.

This court says: " We do not understand the Circuit " Court to have said that the omission of Connor to try his " safe by the proper tests would deprive it of its priority; " nor his omission to bring it into public use. *He might have* " *omitted both, and also abandoned its use and been ignor-* " *ant of the extent of its value; yet if it were the same* " *with Fitzgerald's, the latter would not upon such grounds* " *be entitled to a patent ;* provided Connor's safe and its " mode of construction were still in the memory of Connor " before they were recalled by Fitzgerald's patent." Justices McLEAN, DANIEL and GRIER dissented, on the ground that it was immaterial whether Connor had forgotten the mode of construction or not ; the soundness of the proposition, that it was material that Connor should remember it, was, explicitly, *not* endorsed in the later case next referred to.

In the Lock case the defense was that one Erbe had made the same and a prior invention. *It was of rough wrought iron, but capable of working.* That about six months afterwards, he had made two locks similar to the first, but had never made another, except one some seven years after the patent in suit was issued, and after the suit was instituted. Four witnesses only, including Erbe, were examined to sustain the defense. Erbe testified that he made a lock in the latter part of 1860, and *thinks it was applied to a door, but was not certain.* Brossy, a workman, testified to seeing the lock at Erbe's house, and to seeing it afterwards, or one like it, on a door in the shop. Another workman testified that Erbe showed him the lock early in the year in which the patent in suit was issued, and another workman testified that Erbe showed him the lock about the same time, and that as it was their custom to test new locks on a door, he believed that this was so tested, *but could not say positively that such was the fact.* All four gave their testimony between eight and nine years after the events occurred of which they testified.

The lock was never manufactured by the firm for whom Erbe was working, nor was there any evidence that Erbe ever triedto induce the firm for which he was working (lock manufacturers), or anybody else, to adopt it, or ever tried to manufacture or sell it himself. There was no evidence as to how successfully the lock worked when tested on a door, although if it were like the alleged reproduction, manufactured pending the suit, it would undoubtedly have worked successfully. The rule in such cases, as stated by the Supreme Court, is as follows: "The invention or "discovery relied upon as a defense must be complete, and "capable of producing the result sought to be accomplished; "and this must be shown by the defendant. The burden of "proof rests upon him, and every reasonable doubt should "be resolved against him. If the thing were embryotic or "inchoate; if it rested in speculation or experiment; if "the process pursued for its development had failed to "reach the point of consummation, it cannot avail to defeat "a patent founded upon a discovery or invention which "was completed, while in the other case there was only "progress, however near the progress may have approxi-"mated to the end in view. The law requires not con-"jecture, but certainty. If the question related to a "machine, the conception must have been clothed in sub-"stantial form, which demonstrated at once its practical "efficacy and utility. (*Ried* v. *Cotter*, 1 Story, 590.) The "prior knowledge and use by a single person is sufficient; "the number is immaterial. (*Bedford* v. *Hunt*, 1 Mass.

"302.) Until his work is done, the inventor has given "nothing to the public."

The court proceeds to quote the language in *Gaylor* v. *Wilder*, hereinbefore given, and then says: "Here "it is abundantly proved that the lock originally made "by Erbe was complete and capable of working. The "priority of Erbe's invention is clearly shown. It was "known at the time to at least five persons (including "Jones), and probably to many others in the shop "where Erbe was working; and the lock was put in "use, being applied to a door, as proved by Brossy. "It was thus tested and shown to be successful. Those "facts bring the case made by the appellees within the "severest legal tests which can be applied to them. The "defense relied upon is fully made out."

We shall submit that the Drawbaugh defense is at every point so within and distant from the confines here drawn, that, tested by these judgments, there is no attack made by complainants which has reached, or can reach it.

The policy of the law is to give the utmost possible encouragement and protection to the inventor — not the patentee.

That of which we have heard so much, of the vast amounts invested under the Bell patents; the large expenditures made in perfecting them; the hosts of people who have their "all" invested on the faith of them, as well ss the reflections upon "unscrupulous speculators," said to be behind Drawbaugh, cannot add the gravity of a feather in weighing the matter of priority of invention; such matter has no place in the balance, as legal evidence, and cannot obstruct for one moment the legal path at the end of which stands the Inventor of the Electric Speaking Telephone.

THE DATE OF THE CONCEPTION AS TO WHICH WE ALLEGE PRIORITY.

We can safely assume at the outset, that the evidence and considerations heretofore presented and discussed by our learned associates in this defense, establish that the date of Mr. Bell's alleged invention can be fixed no earlier than March 10, 1876; certainly no earlier than February 14, 1876; but for the purposes of the Drawbaugh defense, we may safely set the date of the conception by Bell at the day of the accident on the ~~Harp~~ spring machine, and which he absolutely fixes as having occurred on June 2, 1875. (See his letter of that date, *Cross-examination, II. Complainants', p. 1,695; Complainants' Exhibits, p. 1,005.*)

Previous to this he had even abandoned experiments with the diaphragm, and it was not until the 28th day of December, 1875, in his interview with Mr. George Brown, of Toronto, Canada, that he drew a sketch of his July, 1875, instrument predicated upon his experiments subsequent to the accident of June 2, 1875, and placed upon it these words in his own handwriting: "*First attempt to transmit the human voice.* The varying pitch of voice could be discriminated, but not the quality. A sort of muttering effect was perceived at the other end." (*Complainant's Ex., p. 1,013*). And so, though the evidence permits us to place the date of Bell's invention months later, and although for the purpose of this defense it may be placed months earlier, we fix the

EARLIEST DATE OF BELL'S INVENTION, JUNE 2, 1875.

We present a history from the first idea conceived by Drawbaugh, of transmitting articulate speech over a telegraph wire in 1859–60, through various experiments by which the conception finally took on mechanical, though rude forms, and became of practical use, down to the finished and nicely-adjusted mechanism; all prior to this as the date of Bell's invention.

As briefly as we may, we shall discuss this history and the evidence, under the following heads, in their order:

I. THE NATURE OF DEFENDANTS' EVIDENCE, ITS CHARACTER AND LEGAL EFFECT, AND THE CRITICISMS UPON IT.

II. COMPLAINANTS' EVIDENCE ANALYZED.

III. GENERAL CONSIDERATION OF DRAWBAUGH AS AN INVENTOR, AND THE ERRORS OF THE CIRCUIT JUDGE IN RESPECT OF HIS MENTAL EQUIPMENT AND STORY.

IV. THE CREDIBILITY OF DANIEL DRAWBAUGH, IN THE LIGHT OF HIS TESTIMONY, HIS HISTORY AND SURROUNDINGS.

V. DRAWBAUGH'S CONCEPTION AND INVENTION OF THE TELEPHONE.

VI. DEFENDANTS' PROOFS ANALYZED.

I.

This history rests for its general truthfulness, and for the accuracy of its details, not upon the testimony of interested witnesses; not upon the testimony of one, two, six or a dozen, but upon the direct and positive testimony of an entire community, and of the frequent and occasional visitors to that community, representing all classes of citizens, in every trade and occupation.

Over two hundred persons testify to knowledge of Drawbaugh's telephones as an accomplished invention prior to the date of Bell's. Over seventy talked through the machine. Over one hundred and thirty saw the machines, and most of these identify instruments.

There is nothing of inherent improbability in the proposition that so many people of various occupations and employment can give direct testimony in this case, as the fact comes in naturally, and is conceded on all sides, that in the country village of Eberly's Mills, well known throughout that part of the country, Drawbaugh's shop was a common resort for many people of the village and of the country side, and it was a place to which visitors were frequently taken as a place of local note; while Drawbaugh himself was considered a remarkable man among the people.

The great mass of evidence for the defense is essentially not of a class frequently criticised in such cases as being dependent upon the memories of illiterate or careless witnesses as to conversations, statements, or even plans and specifications with or submitted by an alleged inventor at some former time; but on the contrary is that kind of testimony which in every branch of the profession is admitted to be even superior to that of the mere learned or scientific, where it bears upon the practical truth of novel results and effects as facts. There is no room for mistake.

It cannot be conceived that any honest witness could have made a mistake, or that his memory could be beguiled by imagination, "wrought upon by influences to which his ears were subjected," as to his having done so marvelous a thing as conversing through a machine and recognizing the tones of a human voice, at a distance over telegraph wires, at the time in question.

In the condition of the art, and of their knowledge at the time, a greater proportion of such witnesses would be impressed by such a fact as by a miracle.

So strong and vigorous was this class of testimony that the court below was constrained to hold that "The "case made by these witnesses is sufficiently formidable to "overcome the legal presumption of the validity of the "complainant's patent."

It is true that in all branches of jurisprudence instances are frequent in the cases, and illustrations common in the books, of the fallibility of direct testimony, from honest mistake.

Such instances and such illustrations occur and are drawn, throughout the history of the law of evidence, from one general class of Oral testimony.

It is that which depends for credence upon the unaided memory of the witness, in relation to some ordinary thing, not unusual, unnatural or striking, in and of itself. Thus, the testimony of an honest witness to the fact merely, that at a certain time and place, he saw two individuals together, might be successfully assailed, while the statement of the same witness that he saw them together, and saw one of them strike the other or shoot the other, would be invulnerable.

So, by the same rule, direct testimony by the average witness as to ordinary conversations or statements at a distance of time, may be as unreliable as his recollection of the contents in detail of a letter, which, intrinsically, or to the witness, was of no particular interest; in both instances becoming less reliable in proportion to the lapse of time. Such evidence, while it may be competent, has little weight.

So, memory of such witnesses as to statements, and plans and sketches of inventors in ordinary machinery, or extraordinary machinery used for ordinary purposes; and even as to the parts and adjustment of the mechanical parts of such machines.

The history of patent litigation, the judgments of courts in such cases, and the complainant's brief below and here, teem with modern instances of the application of proper caution and of absolute decision against this kind of direct evidence.

It is doubtless true that the misty and lineless impressions of men, especially of the unskilled and unlearned in the art, might easily be beguiled by subsequent events, interest or influences, into giving out a seemingly honest but mistaken description of well-defined parts and accurate adjustments. Strong circumstantial should overcome direct evidence in such cases, as in the Howe Sewing Machine cases.

1 Fisher, 162.

But the testimony here attacked is as far beyond the range of that doctrine as the target of a Columbiad is beyond the range of a bird gun.

Other and equally well settled rules apply. If the circumstances narrated were likely to attract the attention of a person "In consequence of their importance, either "intrinsic or with relation to himself," doubt is resolved in favor of the memory of the witness.

It is said of the King of Siam that he believed everything the Dutch traveler told him, until he said that in Europe the water in winter became so solid that men and even elephants could walk upon it. This, his majesty said, was impossible, and at once accused his entertainer of lying.* There can be little doubt that after the interview, the monarch's memory remained good of the fact that he *had* been told of this thing, and he would have remained a good witness to that particular part of the conversation for the rest of his life. If, in addition, he had been, for the first time, brought to view and test the ice of a frozen river in a country where water sometimes freezes in the season of winter, his testimony, at any subsequent period, that the water was frozen on the particular day of his view of the wonder, would be worth that of a hundred residents of its bank who should testify from mere memory, that the river was or was not frozen on that day.

---

*Locke on the Human Understanding.

In this case we have hundreds of witnesses whose circumstances and relations are in perfect harmony with the theory that they could have seen and heard the thing alleged if it had occurred; each individual describing either the knowledge of his own senses of a result, or of the hearing of a result, which, if in fact it occurred, or if in fact he heard of it, was the most startling and unheard-of thing in all his experience. To him it was a sharp and vigorous departure from the course of nature; becoming known of men, this thing equally moved and astonished the civilized world.*

Imagine a suit for an infringement against Fulton, and the testimony of a witness that he was on board on the trial trip, and then imagine counsel making the charge against him that he was beguiled by his imagination into honestly thinking that he saw the boat propelled against the current by steam or by unseen forces!

In the then state of knowledge, especially in the community of Eberly's Mills, the transmission of the voice by wire and of the tones of the voice by electrical machinery beyond ordinary hearing distance, was to present such a marvel as to challenge attention in the very nature of things.

It was not merely a wonderful mechanical contrivance like the sewing machine, which accomplished the seemingly improbable combination in mechanics, which could perform rapidly and perfectly a familiar work; but this was an unseen and mysterious cause, whose processes were not discoverable to the vision, whose force seemed rather of the unnatural, and whose *results alone* impressed the mind and memory.

---

* "A result of transcendant scientific interest, and the greatest by far of all the marvels of the electric telegraph."—See opinion of court below, p. 25.

No detail of mere machinery or adjustment needs to be remembered. If the machine *talked*, and the witness *heard* it, there can be no doubt of the accuracy the impression made. If the machine talked, we might well dispense with the fallible memory of some unlearned and unskilled witnesses as to the mechanism employed, because we know that the appliances used in the magneto and variable resistance instruments were the invention here in issue, as none others would or can transmit articulate speech by the electric current upon wires.

This brings us to another oft-repeated criticism of several individual witnesses for the defense. If the shrewdest and most able cross-examination could lead a witness to say that he had seen and talked through a certain instrument of the exhibits in evidence, identifying it, when it could be argued that at the exact time of the act the particular instrument identified was not perfected or in use, according to the testimony of Drawbaugh, or some other witness, the learned counsel profess themselves satisfied, and urge the court to agree with them, that the testimony is quite demolished. Their theory as to the fallibility of honest, direct testimony, given by the unskilled and unlearned, as to the existence of the machines here disappears, and in its place we have the proposition that these particular witnesses are wicked falsifiers; and these are ignorant men and women; "Pennsylvania farmers, gullible now, and gullible then."

While we have the testimony of the learned, as well as of the ignorant, yet, even of the latter, we submit that it is the strongest possible corroboration of their statements, and the strongest possible contradiction of the complainants' position (that these many witnesses either falsified wilfully, in concert from corrupt collusion, or from the unconscious effects of consultation or "village tavern gossip"), that they do not agree in their memories of the, to them, novel parts of the instrument; or are at fault or are mistaken as to the identity of the instruments, or of the difference between the carbon or variable-resistance machines and the magneto machines.

They are agreed in memory of the great, conclusive fact, that this machine DID TALK.

Running through this testimony from the population at and about Eberly's Mills, and its frequent visitors, we find repeated and constantly appearing support of the main facts testified to, in perfectly natural and consistent collateral matters.

For instance, we find the unlearned and unskilled remembering well the talking machine, when clothed in the familiar garb of a tin mustard box or common glass tumbler, and forgetting other details; we find others remembering the instrumentswith any peculiarity about them like the spiral magnet better than they can recall other parts, as that particularly struck their attention, and naturally would do so, we find the blacksmith remembering the shape and position of the permanent magnet with which he is familiar, and forgetting all about the electro-magnet, of which he knew nothing; we find many remember the common horse-shoe magnet as used, because they knew before what it was. We find a farmer, like Fetters, recalling all the details for applying electricity about the machines, but cease to wonder at his accuracy when we find that the farmer had at some time before greatly interested himself about practical electrical machinery. We find the more familiar in such matters giving more details; the totally ignorant in such matters giving no details at all. The very diversity of detail, the absence of concurrence in circumstance, in occasion and in time, presents this mass of testimony as impregnable against the complainants' theory, that it is the product of consultation or of pre-arrangement.

Neither their sharpest cross-examination, nor their swarm of agents and detectives employed from among well-known members of the community, as well as from without, have been able to bring out any admission or circumstance tending to show that the witnesses have been impressed by an exchange of views among themselves, by undue influence from interested parties, or that they are in conspiracy in framing their evidence.

Is it possible, that complainants' counsel have not been able to break the " fabrications " of even one ignorant and gullible Pennsylvania farmer, and must use rhetoric, rather than the record, to expose the frauds!

It is not possible, if such a conspiracy existed, and an entire population in it; that, in the course of years, no one of the hundreds of conspirators in every walk of life, has ever been weak or careless, or off his guard, so as to betray the slightest hint of it, even in the conversations with his own co-conspirators; yet if he has, the secret agents of the complainant, among the friends and neighbors of the conspirators, have not found it out. The breaking down of two or three, and no more, of the witnesses called upon the question of dates, strongly aids in the demonstration that the mass are unshaken in their testimony. It is rather further evidence that we have called the population to testify, and that in every community there are one, two or three, covetous of the ephemeral distinction of the witness-stand; of the importance of figuring in a case of so much interest, and willing to gain it by a stretch of conscience.

Care has been taken, however, in summoning witnesses to testify, to call no man whose character or whose word could be successfully impeached by any methods known to the law. And it is remarkable, we submit, that in a case of this magnitude, with every means and resource at their command, the complainant, after years of effort and search in near and in the most remote paths, and in every collateral by-way, now rest the charges of conspiracy and of gullibility against these witnesses, only upon the bare statements of counsel. The lives of all the witnesses are clean, their characters for truth and veracity unassailed, and the evidence of any attempt to influence the memory or the impressions of any man called, cannot be successfully pointed out in this record.

We submit, commencing at p. —, an analysis of the testimony, and call particular attention to the absolute certainty of the dates as fixed by collateral matters in every instance.

II.

COMPLAINANTS' TESTIMONY.

As tending to show that Drawbaugh did not invent and use in his shop the Electric Speaking Telephone, as testified to by the witnesses for the defense, the complainants introduce forty-eight witnesses from Eberly's Mills and from various parts of the United States, who are put upon the stand for the purpose of showing they never saw the machines in his shop, *and never heard them spoken of.*

We shall see that of these but ten stand the test of cross-examination and rebuttal, even as to the point to which they testify; while the ten are disposed of on other grounds. Among these witnesses, the first and most important, and one whose means of knowledge and relations with Drawbaugh are claimed to strengthen complainpnts' theory more than any other witness, is THEOPHILUS WEAVER. (*Complainants' Case, vol. 1, p. 376.*)

He describes himself as a "solicitor of patents, pattern-maker, builder, and experimental machinery manufacturer," and as "counsel in patent cases."

He testifies that he had acted in getting up specifications for Drawbaugh in various minor inventions, and, in a word presents himself as the man to whom Drawbaugh would most likely make known his telephone inventions, if they had existed. He then proceeds to testify, in chief, that he never heard that Drawbaugh had invented a telephone until the first half of 1878, and then it was a mere device to be connected with a clock, "to announce the hours vocally."

It transpired in his cross-examination that he had been employed by the complainants to get up testimony (*Id.* 445, *et seq.*) in the neighborhood, and to influence sentiment in the community (page 480), and had been so employed by an agent of the complainants, who was visiting the vicinity under an assumed name. It also appeared that he was not on good terms with Drawbaugh, for the reason that he, the witness, had grossly betrayed Drawbaugh as a client (*Id.*, p. 404) in a patent litigation, and had also attempted to pirate the invention himself by applying for an "improvement" upon it. (*Id.* 417.) He then endeavored to betray the person to whom he betrayed Drawbaugh. (*Id.* 414.)

The cross-examination shows conclusively that this man has no notion of honor, and no regard for his oath. (*Id.* 435.)

It was a common practice with him to act as counsel or solicitor for mechanics, and others seeking patents on inventions, and then appropriate to himself the knowledge thus obtained in a professional capacity, by patenting "improvements" upon them. The man paints his own character as infamous, and stamps his own testimony as unworthy of the slightest credence; a man of fraudulent methods and of corrupt conscience, we find him the accredited agent of the complainants, and he stands at the threshold of their testimony.

Complainants also called David A. Hauck in the same line of negative testimony. He is the person with whom Drawbaugh had the suit in which Mr. Weaver was counsel, above referred to. It appears clearly, from his cross-examination, that he was adjudged, both by the Examiner of Interferences, and subsequently upon appeal by the Board of Chief Examiners, to have sworn falsely. Both of these tribunals found not only that he had sworn falsely as to the facts in the case, but that he had taken a false oath upon filing his application for a patent; that he was not at all the inventor of the faucet in controversy, but had it from his opponent Drawbaugh. (*I. Comp., p. 823, et seq.*) He testified that, although frequently in Drawbaugh's shop, he had never seen any talking machine and never heard of one.

Without regard to the personal feeling or the character of the witness, especially in view of the fact that he contradicts an exceptional number of men and women testifying as strongly to a memory of a positive and wonderful fact, we urge that this case affords an exceptionally striking illustration of the wisdom of those settled legal rules for valuing evidence, which give great weight to positive, and little weight to negative testimony.

This court has said of this rule, in *Stitt* v. *Huyderkopers*, 17 Wall. 354, 394: "The court charged the jury, "that 'it is a rule of presumptions, that ordinarily a witness "who testifies to an affirmative, is to be preferred to one "who testifies to a negative, because he who testifies to a "negative may have forgotten. It is possible to forget a "thing that did happen; it is not possible to forget a thing "that has never existed.' We are of the opinion that the "charge was a sound exposition of the recognized rule of "evidence of frequent application."

See Collection of Cases, 14 U. S. Dig 642.
See Gilbert on Evidence, 140.
1 Stark on Evidence, sec. 32.

While no person possessing a memory could well forget having talked through one of these machines at the time in question, yet it may be true, that persons called to testify (as they are) that they never heard of it years before, or did not see it, tell the truth, from lack of opportunity to see or hear it. A very few honest and disinterested, may be an exception to the rule, and actually forgotten the conversation or the view.

The differentiation in the ability of persons to recall facts, or impressions from the eye and ear, of things and conversations not in and of themselves remarkable, is a matter of common observation. In respect of this, may be considered the difference between the man of many affairs and the man of few; the man of mental occupation and the man of other pursuits; the man devoted to his own interests and the man interested in the affairs of his neighbors; and, finally, the difference of age and temperament, which would affect the proposition, that all men having merely seen, or heard of a thing likely to make a grea'er or less impression, as men may vary, all men would remember it.

And, too, the average lay mind has never yet comprehended that " don't remember " may not be resorted to in cases of self interest; to avoid enmity, or to please a friend; or that it can amount to perjury or any wrong; upon that answer no prosecution for perjury ever did stand, because of the practical impossibility of proving of the particular witness that his power of memory was equal to that of other men. No physical or psycological research, and no expert could afford the proof, whether he in fact did remember; and witnesses are more easily influenced not to remember.*

The usual question put to these witnesses was substantially as follows: " If Mr. Drawbaugh, for five " or six years before speaking telephones were heard " of elsewhere, had at his shop a talking machine, " by which people at different places could carry " on conversation with each other along a wire, and " had frequently shown it to people, and had had them " carry on conversation over it, so that they knew that it " would do what he claimed for it, and had represented " that it was going to supercede the telegraph, do you " think you would have known of it?" (*II Complainants' Case, pp. 1103, 1115, 1135.*) And so the witnesses are made to swear, not only to the premises and conclusion of the syllogism of counsel, but also to his syntax and rhetoric.

There is one consideration appearing in complainants' own proofs that is at once conclusive against the value of this testimony. With a few exceptions, the entire number of witnesses are *offered* to give testimony tending to show:

---

*See evidence of this influence, Harper and Traver, Defts. Surrey, pp. 238, 211; Weaver I Complts., p. 480.

(1) That the telephone never existed in Drawbaugh's shop prior to the Bell patent ; and

(2) That it was not heard of in the community prior to the Bell patent.

With the few exceptions, to which we shall refer, the witnesses testify not only that they did not hear of the machines or know of them from 1867 to 1876, but go further and extend the period to 1878 and 1879 and 1880 ; so that by fixing the dates, the strength of their testimony is no greater to the point that the machines did not exist up to 1876, than that they did not exist in the later years mentioned. If not seeing or hearing of them establishes that they were not there up to 1876, the not seeing or hearing of them by the same witnesses in the same circumstances and conditions, in 1877, 1878 and 1879, would establish that they were not there in the latter years ; but we have from the mouths of the complainants' own witnesses, offered to prove that Drawbaugh's *later* machines could not have been constructed as early as 1876, because he showed the earlier ones, that there can be no question that at the earlier dates of 1876, 1877 and 1878, machines were in the shop in such a condition that they were perfect telephones, though in ruder forms than the later ones.

Complainants' witness, Isaac B. Landis, watchmaker and jeweler (*I Complts. 606*), fixes his visit to Drawbaugh's shop by entries in his book in October, 1876; never saw him before and has never been there since. He says: Q. 23.—" State whether or not Drawbaugh showed you any other machines or devices which he had there, and how he came to show them to you?" A.—" He took us through his workshops and showed us his apparatus for electric bells; also an insulator, and an electric fire alarm and an electric alphabetical apparatus, his lathes and a machine for grinding tighteners for his patent axles, *and an instrument for speaking through, which he called a telephone.*" Q. 28.—" Will you describe, as well as you are able, the telephone which he showed you; state where it was and what Drawbaugh said with relation to it? A.—It was in a room to the left on entering the place by the stairway, nearly opposite the door. *I recollect of it being made of tin; apparently a tin can with a piece of bladder across the end of it, with a magnet attached to it in front of the bladder; and also, he said, in calling our attention to it, that this was to revolutionize the world*, or words to that effect; that it was for the purpose of speaking through; carrying the sound of the voice." He further goes on to describe that the machine had a magnet on it wound with insulated wire.

Rufus E. Shapley (*I Complts. p. 587*), visited the shop of Drawbaugh in October, 1876, in company with Landis. In relating what he saw he says: (*II. 22*): " We saw " several bells which were rung by electricity, an alphabet- " ical telegraph, and an instrument which he called a tele- " phone."

Q. 23—" Where was this instrument he called a tele- " phone; how did he come to show it to you?

A.—" The instrument was lying on a table near a " clock, in the same room."

He then proceeds to give the same description as before quoted from Landis, and states that he understood Drawbaugh to say that " he had it up around the shop." Drawbaugh said that they *had spoken with it, and he identifies Exhibit " B " here in this case as the instrument he saw.*

Complainants' witness, Orlando Kahney (*I Compltს. p.*

1,005), states that he was at Drawbaugh's shop and heard of his working with a talking machine October 3, 1876, and fixes the time by his return from the Centennial. He further shows that he talked through the machine and saw Exhibits "F" and "B" (perfect machines), as early as the winter of 1877–8 (*pp. 997, 998*).

Charles A. Landis (*II Complainants, 1,070*) was told by Shapley, between March 31 and April 13, 1877, that "Dan. had a talking machine, and that he should see it "when he went there." And he did see a machine there "for talking by electricity."

Abram L. Rupp (*II Complainants, 1,144*) testifies to talking through the machine with Drawbaugh in the winter of 1877.

Complainants' witness, Geo. C. Rupp (*I Complainants, 1,126*) testifies to talking through the machine in the shop in the winter of 1877.

The Western Union telegraph operator, Richard B. Ziegler, testifies that Drawbaugh himself brought to his office in Harrisburg, Exhibit "A," in the summer of 1878. (*I Complainants, p. 1,027.*) The witness examined it and remembers it distinctly, and is corroborated by the testimony of Stees and Johnson (*pp. 189, 209, Add. proofs*).

It is conclusively shown on behalf of the defendants that the perfected carbon instrument "J" was taken to the office of Wm. J. Stees, in Harrisburg, May 10, 1878, and left there for trial, and it was then and there operated.

Of these negative witnesses twenty-three stand effectually rebutted by the testimony subsequently offered by the defense, and many of them returned to the stand and corrected their testimony. (See analysis, appendix "C," closing

brief.) These are: Wm. Darr, Jacob Carns, Cyrus Bowman, Abraham Ditlow, Joseph Ditlow, Jacob Evans, Amos Frownfelter, Wm. Frownfelter, Theodore Gissinger, Daniel Hart, Samuel F. Hauck, John Hirsch, Orlando Kahney, Benj. Kauffman, Geo. Kissinger, Geo. W. Mumper, Michael H. Natcher, Wm. Natcher, J. C. Nesbit, E. M. Nichols, Henry S. Rupp, Geo. W. Rowe, Wm. Sadler.

The following appear never to have been in Drawbaugh's shop till after the beginning of 1876, and cannot give any evidence as to what was or was not in the shop prior to that time: M. J. Bailey, Geo. W. Heighes, Keifer, C. A. Landis, I. D. Landis, Rufus E. Shapley, Matthews, H. R. Mosser and Worley. Of the remaining sixteen, we have discussed Theopilus Weaver and David A. Hauck. The dates given by Geo. W. Kissinger, —— Kissinger, J. C. Zimmerman, Elias Kissinger and Geo. F. Kissinger—one family—are contradicted by Wm. Natcher, and are shown to be unreliable in the record, in the hydraulic ram matter. Of the remaining witnesses, Henry and Jacob Niedig, there is no evidence that the former was ever in Drawbaugh's shop, and the latter cannot remember being there after the early part of the year 1876.

Isaac Lloyd, of Harrisburg, was at the shop twice in 1866 and 1867, and again in 1878, and two or three times in the meantime. He did not hear of them up to February, 1878.

Of course we know that the telephones were there at that date, and it is established by the complainants' own testimony. He was never there except on errands, and it is remarkable that there may have been some men there on brief business who were not shown the machines.

John Kahney, quite an old man, is contradicted by his sons, Norman, Ira D. and Augustus.

William Darr (*I Complainants', 358*) testifies that he lived at Eberly's Mills prior to March 31, 1870; that he was around in Drawbaugh's shop during that period; that he never saw any talking machine, and never heard of any. On cross-examination he is made to relate of this period that he had talked with Drawbaugh, who asserted that he would be able to talk across the sea, whereupon Darr replied: "O, "you had better try Yellow Breeches first. What is the "matter with you, Dan; are you crazy?"

As an illustration of the unsafety and utter worthlessness of this negative testimony, J. C. Nesbit (*Complainants', vol. 1, p. 687*) is cited. He was called to prove that Drawbaugh did not mention telephones in 1878. Nesbit was there for the purpose of getting materials for an historical sketch of Milltown. In connection with his testimony the history compiled from the material was introduced, and it was silent as to the telephone, although treating quite fully of Daniel Drawbaugh. Upon the production of a manuscript made by Hull at the very visit Nesbit made, it was shown conclusively that Drawbaugh did mention the telephones, both carbon and magneto, as his invention ("two kinds of telephones"). This manuscript is shown in the cross-examination of Nesbit, and then, on the demand of counsel, the complainants were obliged to put in another copy of the same history, which contained an appendix, with the substance of Hull's manuscript statement about telephones.

This testimony proves something else besides the unreliability of negative testimony.

Nesbit was an intelligent and honest man, telling of a comparatively recent visit, and had it not been for this mannuscript his testimony would have stood to the effect that Drawbaugh did not mention telephones, and that he, Nesbitt, did not hear of them there. It appears with perfect clearness that the agents of the complainants over and over again interviewed persons in Eberly whose memories were positive against their theories, and then failed to call them. (*See Defts. S. Reb., p. 1,117, Ans. 28; Defts. Vol. 2, 1,171; Defts. S. Reb. 333; Defts. S. Reb. p. 375; Defts. S. Reb. p. 155, Id. p. 177, Id. p. 189*).

In this connection, the history of the two Gregorys is interesting. One of the sharpest criticisms made upon the Drawbaugh defense at the first hearing was that those engaged about the shop with Drawbaugh, as workmen, were not called, and that it followed from the defendant's failure to call them, as well as by the testimony of Jacob Carnes, a workman for the complainant, that Drawbaugh's statement and the story of the witnesses for the defense were incredible, because the very workmen about the shop did not know of his telephone.

Before the second hearing in the Overland case (*Add. proofs, pp. 181, 185.*) Emanuel Gregory, a member of the Drawbaugh Manufacturing Company in 1870, and his son, who worked in the shop in 1870, were found living in Massachusetts. They both of them testfied they had not been in the State of Pennsylvania from the 10th day of December, 1870, until the day when they gave their testimony. They further testified that while at work in the shop with Drawbaugh they had many times talked through the telephone with him and aided in his experiments. It appeared further that they had been visited by the agents of the complainants, and had made their statements to them in regard to this matter before the first hearing of the cause.

Of this class of witnesses, that which seemed to the Circuit Court to be most conclusive against the defense, is that of Mr. James P. Matthews, managing editor of the Baltimore American. He has the place of honor in the opinion; as the court observed, "with a memory unusally retentive and active," and as "a careful, conscientious man."

He testifies (*I Complainant, p. 540,*) that he went to the shop of Drawbaugh especially to see the electric clock in April, 1878, and he made some brief notes of what he learned, and subsequently wrote from them an article for his paper, published *November 28, 1878.* His testimony is chiefly to the point that he understood from Drawbaugh, at the interview in April, that, while he had experimented somewhat upon telephones, yet he never expected to transmit articulate speech, and that he saw there "no telephone, and nothing that looked like a telephone." This testimony is of the same class as several newspaper articles of 1878, tending to show that Drawbaugh was merely experimenting. The article in question is a tissue of errors in its conception and description of the clock which it purports to describe, and would of itself stamp that portion of the evidence as without value. The witness subsequently wrote a letter (*Appendix, Add. proofs, p. 776*) to complainants' counsel, called out in the argument below, in which he says: "I ought to have said in my affidavit and "in my subsequent examination, that at the time of the "interview I had probably never seen a working telphone, "and knew little or nothing about its mode of operation. "The impressions in the newspaper paragraph referred to "may have been modified, colored or changed by conversa-"tions with other people on the subject after the interview "and before the article was written." He further states in his letter, that "the two wooden hemispheres," which he testified that Drawbaugh showed as parts of the telephone, and had then in his hands, he was mistaken about, and he can not say whether Drawbaugh touched them or said anything about them. Further: "My recollection of the whole transaction is so vague "that I never ought to have ventured to say anything "about it, and the portions of my testimony relating to this "matter, certainly ought not to be considered by the court "in making up its decision." He had testified that his impression was that Drawbaugh had entirely thrown aside telephone experiments; but he is contradicted in this by the defendants' own witnesses, Shapley, D. A. Landis, C. A. Landis, Orlando Kanney, A. L. Rupp, Geo. C. Rupp, Henry R. Mosser and Theodore Grisinger. If this were not enough as to the testimony of this witness, held by the court below to be of sufficient importance to figure as a chief factor in the destruction of the defense, we now quote from the defendants' own brief in the court below, bearing in mind that Matthews' testimony is material and competent only as showing there was no telephone at Drawbaugh's shop in April, 1878, and that all there ever was of it was futile experiment, as follows (Brief below, page 20):

"Our belief is that the *tumbler instrument was first made as an electric speaking telephone in 1877-8;*" they could say no less, as their theory had been, and their witnesses had sustained it, that the electric telephone was there not only in the winter of 1877-8, but also in October, 1876.

It is evident that the complainants were not seeking the truth so much as witnesses to sustain their theory, and that even for this purpose negative testimony is obtained-not as representing the knowledge of the community upon the subjects testified about, but, after being carefully culled and selected, because it was thought, from the lapse of memory, from susceptibility to influence,* or from other cause, the witnesses would be able to say, at least, that they had not seen the telephone, in such language as might be put into their mouths under the manipulation of shrewd examiners. The whole of it should be laid out of consideration.

The testimony of Kieffer and Wilson, persons to whom Drawbaugh had shown other inventions, and to whom he talked about his electrical business, standing by itself, has force; nevertheless, they are negative witnesses, and they cannot stand against the positive testimony of men who saw and talked through the telephone, remember the words, and identify the instruments.

Still, it is conceded that such negative testimony of Kieffer's and Wilson's and Lloyd's, unexplained and unanswered, would have greater value than that of ordinary negative testimony, and the Circuit judge has given it almost controlling weight, because they were men with whom Drawbaugh had conversations about other inventions and electrical experiments, and because he did not speak of the telephone to them, and to whom it is assumed he would open his heart freely on the subject. As stated in the opinion in this connection, naming these witnesses with Weaver and Hauck (*supra*):† "The proofs show that during the years from 1868 to 1878 "he did not attempt to avail himself of opportunities for "demonstrating his invention and bringing it to the notice

---

*See Weaver's cross-examination and letters, I. Complainants, p. 480.

† We have seen that Weaver at least should not be considered worthy of mention, and that Hauck is little better.

" of his friends, who were peculiarly qualified to appreciate " it and were favorably circumstanced to assist him."

Without referring to the possible effect of influence upon the memories of these witnesses and complainants' influences upon all,* we propose to show right here the radical error of this proposition, and to show by positive testimony that it has no material basis to rest upon.*

Mr. Kieffer, Mr. Wilson and Mr. Lloyd resided at Harrisburg, and were men of character, without doubt. David A. Hauck resided at Mechanicsburg, and did not know Drawbaugh until he went to Eberly's Mills in the spring of 1873, for the Hauck Manufacturing Company. He is the witness heretofore discussed as having a litigation with Drawbaugh.

We reply as follows:

1. By the testimony of men of equal or of higher standing than these who figure in the opinion, who were more intimate and more likely to be applied to by Drawbaugh, that he did repeatedly apply to them and explain his invention to them, and:

2. As one reason why he did not speak of the telephone to the witnesses named in the opinion, or apply to them for help, that he was laughed at, derided and denounced as crazy by those men who knew him best, and were of as high character as those to whom he did not apply.

I.

Hon. Richard D. Haldeman *(Add. proofs, p. 102)*, the member of Congress from that district from March 4, 1869, to March 4, 1873, testified that during his first cannot as representing the knowledge of the community upon the subjects testified about, but, after being carefully culled and selected, because it was thought, from the lapse of memory, from susceptibility to influence,* or from other cause, the witnesses would be able to say, at least, that they had not seen the telephone, in such language as might be put into their mouths under the manipulation of shrewd examiners. The whole of it should be laid out of consideration.

---

*See letters of Complainants' agents, Complainants' I. 480; and see Defendants Sur. rej. 238.

The testimony of Kieffer and Wilson, persons to whom Drawbaugh had shown other inventions, and to whom he talked about his electrical business, standing by itself, has force; nevertheless, they are negative witnesses, and they cannot stand against the positive testimony of men who saw and talked through the telephone, remember the words, and identify the instruments.

Still, it is conceded that such negative testimony of Kieffer's and Wilson's and Lloyd's, unexplained and unanswered, would have greater value than that of ordinary negative testimony, and the Circuit judge has given it almost controlling weight, because they were men with whom Drawbaugh had conversations about other inventions and electrical experiments, and because he did not speak of the telephone to them, and to whom it is assumed he would open his heart freely on the subject. As stated in the opinion in this connection, naming these witnesses with Weaver and Hauck (*supra*):† "The proofs show that during the years from 1868 to 1878 "he did not attempt to avail himself of opportunities for "demonstrating his invention and bringing it to the notice

---

*See Weaver's cross-examination and letters, I. Complainants, p. 480.

† We have seen that Weaver at least should not be considered worthy of mention, and that Hauck is little better.

" of his friends, who were peculiarly qualified to appreciate " it and were favorably circumstanced to assist him."

Without referring to the possible effect of influence upon the memories of these witnesses and complainants' influences upon all,* we propose to show right here the radical error of this proposition, and to show by positive testimony that it has no material basis to rest upon.*

Mr. Kieffer, Mr. Wilson and Mr. Lloyd resided at Harrisburg, and were men of character, without doubt. David A. Hauck resided at Mechanicsburg, and did not know Drawbaugh until he went to Eberly's Mills in the spring of 1873, for the Hauck Manufacturing Company. He ls the witness heretofore discussed as having a litigation with Drawbaugh.

I.

Hon. Richard D. Haldeman *(Add. proofs, p. 102)*, the member of Congress from that district from March 4, 1869, to March 4, 1873, testified that during his first canvass for Congress, he visited Drawbaugh's shop, and Drawbaugh exhibited to him and explained to him the talking invention. He remembers the wrapped wires distinctly. He relates (*p. 103*): "I was so much impressed that invariably, when elected to Congress, I sent to Daniel Drawbaugh the mechanical reports, believing him to be a mechanical genius. He is corroborated by his wife, a daughter of Ex-secretary Simon Cameron, who learned from her husband in that canvass of 1870, the year she was married, of the wonderful machine at Drawbaugh's shop, which carried the voice from one place to another by electricity, and that when the first "telephone" was publicly talked of, it was spoken of by husband and wife as recalling the knowledge of Drawbaugh's invention, as Drawbaugh's patent.

---

*See letters of Complainants' agents, Complainants' I. 480; and see Defendants Sur. rej. 238.

Dr. Bowman (*Add. proofs, pp. 172, 177*) remembers the date of visiting Milltown, during the baptism of Mrs. Wm. R. Gorgas, and when his child, born Nov. 10, 1867, was between two and three years of age, and as prior to the death of Mrs. Bowman's mother, March 14, 1871, thus fixing the date. He testifies to talking between the basement and the third floor with Drawbaugh's telephone, and gives a portion of the words. He is corroborated by his wife. (*Id., p. 177.*)

George W. Hunter (*Add. proofs, p. 172*), proprietor of the Lochiel Hotel, at Harrisburg, since the year 1868, was applied to by Dr. Moffit to advance money and take hold of the Drawbaugh telephone, prior to the centennial. (See Moffit, *infra.*)

John M. Woodburn (*Add. proofs, p. 133*), when candidate for the office of County Treasurer of Cumberland County, in 1873, against Lavan H. Orris, who was nominated and elected, testifies to his visit to Eberly's Mills in August, 1873, that he was shown the telephone by Drawbaugh, who explained it to him, and the use of the wires and the manner of conducting the electric current, and was told that it would talk for miles, and that he desired means to aid him to patent it and introduce it.

He is corroborated in every particular by Mr. Geo. Emrick (*Add. proofs, p. 130*), who was with him.

Mr. Orris (*Add. proofs, p. 121*), the successful candidate for county treasurer that year, 1873, during the canvass visited Drawbaugh's shop, and had substantially the same interview as was had with the others just referred to.

Jacob Barber, who had been commissioner, supervisor and school director, (*Defts. S. p. 371*), and candidate for the office of county commissioner that year, testifies as of the same date and substantially the same things.

The same of Longnecker (*Add. proofs, p. 155*); Abram Marquart, one of the most prominent citizens of Newville, as of March, 1875, with the date fixed absolutely by a business transaction which took him there, and by his books.

Wilson H. Strickler (Add. proofs, p. 233), stock raiser, fixes the date as prior to the 15th day of August, 1874, conclusively, as that was the first, last and only time he was ever in Drawbaugh's shop in his life, or ever in the village of Milltown in his life. He talked through the telephone, describes the sound as coming from the wires through the instrument in which he listened, identifies Exhibit "C" positively as the one used, and the use of electricity was fully explained to him by Drawbaugh.

This witness at the time was engaged in making an invention of his own, viz., a method of insulating telegraph wires by means of mica, combined with other materials, for which invention he filed application for a patent August 15, 1874. He visited Drawbaugh's shop prior to the filing of his application, and while he was engaged in maturing his invention, and prior to obtaining it, because he wanted to see whether there was anything in the construction of the machine providing for the insulation of the wire by means of thread or silk, that he could advantageously employ in his own invention for insulation by means of mica.

Christian Eberly, who formerly owned the most of the village of Eberly's Mills, one of the most prominent and respected men in the community, a former partner of Gov. Geary, and who knew Drawbaugh intimately, testified (*D. vol. 1, p. 121*), that Drawbaugh applied to him prior to January 1, 1871, to go into partnership with him on the telephone; Eberly to furnish the money for a half interest in the invention, and that witness did not accept the proposal.

Henry Snyder, grain and commission merchant, testifies (*Id., p. 513*) that in 1872 and 1873 he was repeatedly applied to, on behalf of Drawbaugh, by his brother, to aid him in taking hold of the talking machine.

Henry Baylor, retired lumber merchant, of York, Pa. (*Id., p. 150*), testifies that as early as June, 1873, Drawbaugh showed him the inventions, and that he, witness, said to him then: "Why, Dan, this is virtually a talking telegraph," and that Drawbaugh asked him to take hold of the matter for a one-half interest.

Dr. J. W. Moffit, of Harrisburg (*D. I., p. 494*), testified that prior to the Centennial year he was applied to by Drawbaugh, either to go in with him to get out a patent; or if he, Moffatt, had not the means, to get some one else to do it. (See Hunter, *supra*.)

Capt. J. A. Moore, a member of the Axle Co. with Drawbaugh, Principal of the Whitehall Soldiers' Orphans' School, former member of the firm of M. N. Grove & Co. (I. D., p. 614), fixes the date positively in May, 1875, that Drawbaugh applied to him for assistance and explained the telephone to him, and he identifies Exhibit "B" as the machine then shown to him.

Wilson Bear, (D. I., p. 635), a member of the same company, has some recollection of having been offered an interest in the invention, and of Drawbaugh asking for assistance in the matter in 1875.

It appears from Christian Eberly's testimony (D. I., p. 113), that Drawbaugh, in 1871 and 1872, tried to induce Mr. Lee, Private Secretary to Gov. Geary, to take an interest in the telephone.

Jacob E. Shettel (D. I., page 206), who identifies and describes Exhibits "B" and "L" minutely, with the details of the electro-magnet and the wires, was a former member of the Electric Clock firm, and in 1872, 1873 and 1875 saw the telephone, and was urged by Drawbaugh to assist.

Harmon K. Drawbaugh (D. I., p. 550) testifies, that as far back as 1872, Daniel Drawbaugh urged witness to try and find persons to go in with him.

Elias Greybill (S. Reb., p. 184), former member of the firm of Zachrias & Co., testifies that before the firm of Zachrias & Co. gave up their warehouse at Whitehall Station in September, 1875, Drawbaugh applied tohim for money to assist in getting the telephone introduced.

William R. Gorgas, of Harrisburg, Pennsylvania,

(D. S. Reb. 1,128) gives corroboration of this testimony, but cannot remember which invention it was for which Drawbaugh wanted assistance.

Thomas Draper, of Dover, Delaware (Defts. Sur. Reb. 1,123) manufacturer, and owner of a line of vessels running from Philadelphia to Dover, testified that in 1874 he saw the talking machines, and was asked to aid in getting patented and introduced.

He is corroborated by his wife's testimony, Mrs. Annie E. Draper (*Defts. S. Rej., p. 208*).

Jesse Eickholtz (*D. S. Reb. 154, ans. 17 and 18*), testifies that Drawbaugh wanted him to go into it in November, 1873; and when he declined, he asked him to urge his friend, George B. Eyster (the sheriff of the county, to go in).

Eyster (*Id. p. 890*) corroborates this statement.

Orlando Kahney, (*D. S. Reb. p. 35, 45*) testifies, that October, 1875, Drawbaugh tried to borrow money of him to patent a telephone invention.

Mr. Herr, of Harrisburg (*II Defts., p. 667*) testifies, that early in 1871, Drawbaugh applied to him for help, and then asked him to try and procure some person to assist him, and he would give him a half interest in his talking machine.

Henry F. Drawbaugh, his brother, a man of influence and standing, testifies that Daniel repeatedly urged him to furnish the means, and, failing in this, tried to borrow the money from him for the purpose. (*D. I. p. 396*).

2.

As to his reasons for not calling on every one, D. Balsley (*Vol. 1, p. 192, Ans. 16*) testifies that prior to 1874 Drawbaugh talked with him about it, and stated that he had asked his best friends, and they had all refused him, and that if he had the means he could put it through very quick. (*Ans. 27.*) He said the same thing to others, notably to W. H. Bates in 1874 (*D. Vol. 1, p. 419, Ans. 15 and 16, Cross-ans. 23, 24 and 42*): "He had asked "several men to assist him, and they had just laughed at "him. Several times that I was there his mind seemed to "be taken up with it. He said he would like to get up a "patent, but he hadn't the means to do it. He said he "could make a fortune out of it."

He told Waggoner, in Nov., 1874 (*D. I. 122; Ans. 5, 21, 9, 27, 29 and 24*), that the machine was perfect, and that it would be the first talking machine patent in the world, showing him instrument Exhibit "A." Drawbaugh himself testifies (*D. Vol. I, p. 831; Ans. 4, 21, 22 and 23*) that people ridiculed him, told him he was crazy, and it was so talked at the village store.

The witnesses, Fettrow and Waggoner, Yetter, Glory, Zimmerman, Henry P. Drawbaugh, Bates, Rupp, Byers, Bricker, Mosser, John S. Drawbaugh (all in D. vol. 1); Lenig, Updegraff (D. vol 2); Zearing, Mrs. Brown, Sprenkel, Hosler, Graham, Murphy, Woods, Landis, W. W. Snyder, running through three years (all in S. Reb.), testify that Drawbaugh was ridiculed, called a fool, crazy, and a crank, because of his claiming this invention, and that it would never come into use.

Captain Moore testified (*D. I., vol. –, p. 614, ans. 36; H. F. Drawbaugh, 396, ans. 49 and 50*), that Drawbaugh was an extremely sensitive and diffident man.

We suggest that it would be presumable on such testimony, aside from other reasons going to rebut this testimony, that the three or four witnesses testifying that Drawbaugh did *not* speak to them were omitted by him because of discouragement or diffidence or experience of repeated rebuff, rather than that the positive testimony of himself, and of so many witnesses of character, is wickedly false.

Even Drawbaugh and his witnesses should now and then have the benefit of the old fashioned, and still not obsolete, presumption, in favor of truth and honesty.

It was said by the learned Circuit Judge, that it was incredible that the statement of the witnesses could be true—that they could remember the words they heard through the telephone.

We respectfully submit, that the criticism would be an apt, as it is a usual one, if made of ordinary conversations, when the witness, after a long period of time, attempts to give the exact words; but, when a man is relating an exceptional experience—an astonishing result, a mystery connected with spoken words—it would be more incredible if he did not remember it.

Decrees and judgments cannot be based upon such reasoning, or against such testimony as we present, and they have not been. To reach such a result in this case resort has been had, not to the testimony, but to the somewhat vague and ill-defined theory of the inherent incredibility of the defense, and especially of the story of Daniel Drawbaugh himself.

We defer a discussion of the overwhelming evidence adduced and remaining uncontradicted in support of the priority of Drawbaugh's conception and invention, to consider somewhat the story of Drawbaugh as given in evidence, and Drawbaugh himself.

III.

GENERAL CONSIDERATION OF DRAWBAUGH AS AN INVENTOR, AND THE ERRORS OF THE CIRCUIT JUDGE IN RESPECT OF HIS MENTAL EQUIPMENT AND STORY.

At the outset, in considering Drawbaugh as a witness, there can be no question but that his history of himself and of his experiments and labors upon the electric-speaking telephone from 1860 to 1879, inclusive, must be either a truthful statement, or one manufactured, in general and in detail, by a wicked mind; a mass of irredeemable perjury from beginning to end; and yet, none of the legitimate methods known to the profession but have been applied in this case, and no resource has failed to bring these methods to bear for the purpose of breaking down that testimony.

Upon the course and path of his life, and his relations and dealings with all men from his boyhood down to his fifty-eighth year, the complainants have focused a light which has made luminous every detail.

Presumably, if his testimony could have been impeached, either by attacking his character, or contradicting his statements by the direct testimony of others, it would have been resorted to. But we find that notwithstanding his difficulties, lawsuits and his controversies with men, by the testimony in behalf of the complainants, as well as of the defendants, that he bore a character, and had a life record, whose honesty and truthfulness could not be assailed. All bear testimony to his steadiness, his industry, his enthusiasm in physics, and especially in electric science. The worst that any man ever said of him was that he was crazy on the subject of the talking machine. Edward Nichols (Complainant's testimony, vol. 2, p. 860) testifies as follows:

Q. 77.—"Do you regard Daniel Drawbaugh as a very fine man; conscientious and truthful? A.—I do."

Isaac Lloyd, another of their witnesses, after testifying that he had known Drawbaugh, says (*Vol. 2, p. 273*), that from his knowledge he was an upright, conscientious, truthful man, and so testified Zacharias (*Defendants' Vol. I, p. 50; Smyser, Id., 78–9; Yetter, Id., p. 173; Condry, Id., p. 142; Paisley, Id., p. 195; J. C. Smith, Id., 342; D. H. Good, Id., p. 507*). He lived in one community all his life, and was known of all men in it. We must take it then, for granted, that there was no evil in his mind or life, so far as human ingenuity was able to find it, in the places and among the men who lived with and beside him during the whole course of it.

The record is full of evidence of the employment of "agents" from the community by the complainants in a search for matter wherewith to attack him. So that on the theory of the complainants and the theory of this decree, the wickedness and devilish cunning by which he sought to impose a fraud upon the public and to work out a great robbery must have been conceived after the publication of Bell's invention in 1876; and to further the scheme, that this witness fabricated a history in every detail and incident bearing on the controversy, covering a period of twenty years and over. He must have made and partially made telephones, having the necessary and harmonious appearance of age, of the most ingenious description, and prepared his story in that regard to stand the most scientific cross-examination in every detail, aided by trained experts.

While it may be true that a man may become suddenly vile, and change and radically contradict the evidence of the course of his life, and while there may be one or two or three illustrations of such monstrosities in the history of human nature, yet it has never been true in the history of jurisprudence that a fabricated story, lying in its general plan and lying in its detail covering a long period and a series of transactions, could stand the tests applied to it in the courts of justice.

Drawbaugh's testimony covers 332 pages of closely printed matter in this record, of which 180 pages are cross-examination, and we think it may be said that the complainants commanded every available resource and all the ability and knowledge, both scientific, legal and common, in this work that could by any possibility be put into an attempt to break a witness by cross-examination.

A careful reading of this testimony, it seems to us, is convincing in itself and by itself of the truth of the story. The very faults of his memory, the immaterial contradictions and changing of immaterial dates only go to strengthen the conviction that the history as related is genuine and truthful. It is without a trace of the inflexibility which characterizes fabrication. The man that speaks is in harmony with the history of the man's character as related; in harmony, with all knowledge of the honest, ingenuous, open-minded genius, as portrayed by the account of his life.

He will not corroborate Eberly, a preceding witness, as to a conversation in 1861-4 which was greatly in his favor, for the reason that he "cannot remember it." (*II Deft., p. 753.*)

He will not corroborate Lowry's testimony that he was shown the cup instrument by Drawbaugh at an early time. He says: "I have been trying to recall it, but I cannot." (*Id. p. 754.*)

If he were cunning and corrupt, he certainly could, when examined in 1881, have been able to describe a rude receiving instrument, as he had described a rude transmitting one. Yet he says he cannot remember the first experiment in receivers, because there were so many different attempts and trials, (*II Defts. p. 760,*) and so the instances of fairness occur throughout his testimony.

Not a Learned Man.

It is said by the complainants that Drawbaugh was not a learned man, and among the arguments to support their theory of inherent incredibility, they say in effect that in the nature of things, no one but a scientist from the curriculum of the schools could have invented the telephone; that it was beyond his mental grasp; and it is said to sustain this proposition, that his inventions were of barrel machinery, jig-saws, nail-plate feeders, measuring faucets, and sundry electrical contrivances, or, as suggested by counsel, " Mere mechanical contrivances and improvements"; and the fact of his busying himself with other inventions in mechanical contrivances is further used in support of the theory of inherent incredibility, as showing that he could not have conceived or had his mind upon so great a discovery as that of the transmission of articulate speech.

So far as the learning is concerned, we believe it can be shown that successful inventors are not the product of the universities, but of natural conditions and of tendencies common enough in American civilization. The tendency here is to learn and advance by experience. American genius cannot be said to be produced, though greatly aided, by school training and discipline. Genius is innate, and the man possessing it, who even, without books learns of a natural principle or agent, like electricity, by handling it and testing its properties, is the man who must advance in its use. No art and no words can portray upon the human mind the impression of a landscape that the actual view will give. No mere theory, though learned in all its technical formulæ, can give the accurate and ready knowledge which practice imparts.

Von Humboldt in his Personal Narrative of Travels in South America, (1799–1804,)* says: "We found at Calabozo, in the midst of the Llanos, an electrical machine with large plates, electrophori, batteries, electrometers; an apparatus nearly as complete as our first scientific men in Europe possess. All these articles had not been purchased in the United States; they were the work of a man who had never seen any instrument, who had no person to consult, and who was acquainted with the phenomena of electricity only by reading the treatise of De Lafond and Franklin's Memoirs. Senor Carlos del Pozo, the name of this enlightened and ingenious man, had begun to make cylindrical electrical machines by employing large glass jars, after having cut off the necks. It was only within a few years he had been able to procure, by way of Philadelphia, two plates, to construct a plate machine, and to obtain more considerable effects. * * * * I had brought with me electrometers, mounted with straw, pith-balls, and gold-leaf; also a small, Leyden jar, which could be charged by friction, according to the method of Ingenhousz, and which served for my physiological experiments. Senor del Pozo could not contain his joy on seeing, for the first time, instruments, which he had not made, yet which appeared to be copied from his own."

The Royal Society of London once elected to honorary membership a man who first demonstrated that lightning and electricity were one. It was the same man whose reports as to his experiments with a kite and a key, it had formerly refused to receive and had made sport of. He stands in history and science as eminent, and is set down as among the most eminent of natural philosophers. He was a "Yankee tallow chandler's son, a printer runaway boy," for whom the schools did nothing.

---

*Vol. 2, Bohn's Ed. p. 111.

Michael Faraday was the son of a blacksmith, and a bookbinder's apprentice. After attending four lectures of Sir Humphrey Davy, he gave his attention to practical experiments with electricity. J. Clark Maxwell, Professor of Physics, Cambridge, says, of Faraday's "Experimental Researches" resulting in the discovery of the induction current: "It was at once made the subject of investigation "by the whole scientific world, but some of the most experienced physicists were unable to avoid mistakes in "stating in what they conceived the more scientific language than Faraday's, the phenomena before them."*

Maxwell on Electricity is largely devoted to reconciling the practical methods of Faraday with the theories of the professors.

Hugh Miller's great conceptions took form when, without education, he was working as a laborer at the Cromarty stone yards.

Ampere worked out difficult mathematical problems with sticks and stones before he had learned the names or forms of figures.

But, says the court below, "Drawbaugh was not only "untutored, but he was isolated by his associations and occupation from contact with men of advanced science," and on such reasoning it is found that he must be a swindler, because he dares to pretend that he invented the telephone!

*Enc. Brit., Faraday, by Maxwell.

But it is said Drawbaugh busied himself with mechanical contrivances of comparative insignificance.

In 1793, Robert Fulton conceived the idea of propelling vessels by steam, and we find, by a reference to his life (C. D. Colden, 1817): "His time was also much engrossed by devising a method of superceding the locks of canals by a plane of double incline, on which he obtained a patent in 1794. In the same year we find him obtaining patents for flax spinning and rope-twisting machines 'and various other mechanical inventions,' bearing upon the construction of canals. In 1797 he went to Paris and resided there seven years, during which time he projected the first panorama ever exhibited, and made important experiments in submarine explosives. It was not until 1806 that he made his successful experiment in propelling vessels with steam in America, and not until 1809 that he took out his first patent.

Guttenberg, pending the tardy recognition of his discovery of the art of printing, was engaged upon inventions for new methods of polishing stones, and manufactured looking-glasses. Franklin found time to acquire something of income from the printing press invention, from improvements in stoves, "Poor Richard's" Almanac, and various other contrivances.

Again, the attack is made upon the credibility of this story, upon the ground that such an invention would have been widely known, and would have commanded all the resources necessary to present it to the public. The great success of Bell after the exposition of 1876 is cited as an illustration. We suggest the marked contrast between the presentation of Bell's alleged invention, under the sanction of international commissioners, framed in the authority of the World's Exhibition at Philadelphia, and the invention of Drawbaugh, in the lowly village shop of Milltown, in a by-way not merely of the world, but a by-way of the State of Pennsylvania, and a by-way of the county of Cumberland. We submit that the complainants can take nothing of benefit from the fact that such men as lived in that community, and such men as passed that way, should not care to invest in any telephone, which seemed a mystery and a novelty, but of no practical utility to the learned and the rich of the great cities long after Bell's patents were issued.

Morse conceived the idea of the electric telegraph on the packet ship "Sully," in 1832, and on that voyage made his rough draughts of the apparatus. For twelve years thereafter he struggled with poverty to perfect his invention, and to secure any consideration for it. During this struggle he denied himself the common necessaries of life. Not until 1836 was he able to exhibit it to his friends. In 1843 he got it sufficiently before the public to secure an appropriation, and it was used for the first time on the 24th of May, 1844.*

Elias Howe for years suffered the pangs of poverty and failure to get friends or capital interested in the sewing machine in this country or in England. He never advanced to fame and fortune until his controversy commenced with Singer.

"And yet," says the learned court, following the theory of counsel, "such an invention is of a kind well "calculated to excite public interest and to impress "practical men with a quick appreciation of its com- "mercial importance and its pecuniary value, * * * "and its efficiency and importance as a factor in human "intercourse could have been demonstrated to the public

---

* Rev. Iraenus Prime's Life of Morse.

"without appreciable inconvenience or expense. Draw-
"baugh fully appreciated its importance and value. He had
"the means to patent it himself, and friends to assist him
"in introducing it into public use. He had the talent to
"induce others to invest in his invention."

No better answer can be found than in Bell's own case.

See New York *Tribune* article, Nov. 9, 1876; C. Vol. I, p. 250.

The Scientific American, Oct. 6, 1877; C. Vol. I, p. 273.

Testimony of Hubbard, Bell's financial backer, C. Vol. II, pp. 1,613-1,662; and

Complainants' Exhibits, p. 959.

Mr. Wm. Orton, President of the Western Union Telegraph Company, could not be interested until the fall of 1878, although it was presented to him in April, 1877 (*C. Vol. II, pp. 1,285, 1,287, 1,428*), and Mr. Bell himself feared ridicule. (*Complainants' Exhibit, p. 986.*)

Exceptional Treatment of the Defense.

Now, what is there in this case that so distinguishes it in the domain of judicial investigation as to require a reversal of settled rules of evidence?

Direct and positive affirmative evidence, unimpeached and uncontradicted, seems to have failed of legal virtue when applied to this particular controversy; and the rule as to presumptions is so radically altered that the testimony of four doubtful witnesses, that they did not hear of a fact—no, that they did not remember hearing of it*—shall be received as finally closing the door against the possibility of its existence, and against the recognition of all direct and positive testimony of twenty-seven equally credible men and women, that they actually did see and hear of the thing.

---

*Kieffer, Complts. 2, p. 1,280.

Yet, we are told that if " he " (Drawbaugh) had a practical telephone to exhibit, he would have selected just such men " as Kieffer and Wilson and Lloyd (who was 'taken " good care of'†) and Hauck (who was Drawbaugh's enemy " and of doubtful veracity), to demonstrate it to them and " to enlist them to demonstrate its utility and value to the " public." And although he did apply to twenty-seven others, it is conclusively assumed that he did not have a telephone, because he did not apply to these four gentlemen. As well might it have been assumed that Howe did not invent the sewing-machine, because it appeared after repeated attempts among his nearest friends, after suffering contumely and reproach in these efforts, it was found that his heart and courage so failed him that he ceased his applications and departed for England without risking further coldness and refusal.

But it seems this case is not only *sui generis* in jurisprudence, but the ordinary experience and history of human nature, of men's motives, of men's probity and and intelligence, can teach us nothing by which to judge of Daniel Drawbaugh " and the cloud of witnesses who corroborate him." Although the biographies of science are full of instances of great discoveries by men of little or no scholastic discipline and who have had no contact with scientific men, yet as Drawbaugh was not a college professor, but a common citizen of Milltown, where he seldom met learned physicists, he could not by any possibility have invented the telephone.

Although the greatest inventors and discoverers, from the earliest to the latest, have either died in povery or succeeded only after long failure to obtain recognition of their discoveries, and year after year have suffered every discouragement and the greatest distress; although this has been a common experience even at the most learned and wealthy and enterprising of the world centres; yet, because Drawbaugh, in the little village of Milltown, could not at once command recognition and influence and capital for the new machine whose uses were unknown, "this story must be a fabrication from beginning to end."*

---

†Complts. I. 480.

And because a community corroborate him, it must be a population of knaves or fools. Even the fact that his fertile mind has produced many other inventions of less note and importance, this very evidence of a mind active in the direction of invention is turned into testimony that greater discoveries are beyond his scope.

The logical conclusion of all this reasoning must be, and by the opinion of the learned court is, that Drawbaugh himself is the malign necessity that demands a new and a special law of evidence and a reversal of all the commonly received notions of human nature to fit this case.

If his story be false, he has built a collosal structure of fiction. The lies in it are as bricks in a great building for number, and a flaw in one would bring destruction to the whole.

As the complainant's whole theory and the decision of the court below rests upon the basis that Drawbaugh is a fraud, and has had the ingenuity to set up the story and the influence to get it so overwhelmingly corroborated, we submit from the record a brief sketch of—

* See opinion of court.

IV.

DANIEL DRAWBAUGH, THE WITNESS, IN THE LIGHT OF HIS HISTORY, SURROUNDINGS AND TESTIMONY.

If a charlatan,* unlike his kind, he has not lead an itinerant life. All that can be told of him from boyhood to age, all the evil or good that is known of him, all the evidences of character that a man leaves in the places that have known him; all the impressions which the course and methods of life of men place upon their environment, exist and are written of Drawbaugh in one place and upon one community.

The story from his earliest to his latest years is a very simple and homely one. If it be true that he developed into a Machaivelli in his fifty-third year, the incongruity is worth consideration from the moral philosophers.

Born in 1827, he has passed his life in the small village of Eberly's Mills, or Milltown, in Cumberland County, Pennsylvania. It is three miles from Harrisburg, and the centre of a farming community. He attended the common schools part of five winters, and in his early years was a reader of the Scientific American, when he could afford to pay his subscription; his scientific library consisted of Comstock's Philosophy, Parker's Philosophy, Youman's Chemistry, and two volumes of Tomlinson's Cyclopedia of Useful Arts, together with a publication on the International Exhibition of 1851.

Before the spring of 1860 he attended a course of lectures on physics by Prof. S. B. Heighes, now Principal of the State Normal School, and for seven years professor of physical science at the York Collegiate Institute. During his attendance upon these lectures, we have it from

---

*See opinion of Circuit Judge.

Prof. Heighes that Drawbaugh was giving attention to electric science, and the professor remembers distinctly that even at that early time he had conceived, and talked of, "*speaking through a telegraphic wire by electricity.*" (*Q. 12, Dfts. S. Reb. 96.*) The same witness remembers distinctly, and fixes the date positively between 1871 and 1874, that Drawbaugh showed him Exhibit "C," and told him that the voice produced "*pulsations*" upon the machine. (*Id. p. 100; Q. 37, 38*). It is undisputed that at that early time he was experimenting with electricity. Complainant's witness, G. W. Heighes (*C. Vol. 2, p. 1095*), says: "He was an enthusiast on the subject of physics at that early time." He was familiar with the Everett accoustic telegraph and with the Leon-Scott phonautograph from about 1863. (*D. Vol. 2, p. 1067.*) "The subject of electricity seemed to be his hobby." (*Dr. Undergraff, Id., p. 1089.*)

He was a person of remarkable ingenuity and skill. At the age of thirteen he made a rifle for Daniel Balsey. (Balsey, I. Dfts., p. 195), and at a later period was remarkably skillful in wood-working. At the age of twelve he made a part of a clock. At the age of sixteen he manufactured a small steam engine, an automatic machine for sawing wood-felloes; the last being his own invention. (D. vol. 2, p. 855.) In 1857, 1859, he constructed and operated a photographic apparatus, making even the lenses himself. (Id., p. 900.) He made for his own use a solar transit and a machine for wrapping electric wires. (Id., p. 957, 971, 1,029.) He made his own galvanometers. Of his skill as a workman, complainants' own witness and his enemies have nothing but praise. Very few men would venture to offer advice to him. (Comp. I., Weaver, p. 380); and he was applied to by others to invent, and did invent machines for them. (Weaver, Id. p. 377.) The tack machine for Patton, the paper-bag machine for Sengsier, and a great many other machines for the pump company and for the axle company. A number of his inventions are enumerated in Dfts. vol. 2, pp. 895, 1,061, 1,062.

"He was a great mechanical genius." (Complts. vol. 2, p. 1,550); and "a great inventor." (Id. vol. 1, p. 864.) All the witnesses concur as to his sobriety, his truthfulness, and his incessant and tireless industry, and of his labors, extending far into the night.

He was careless of his own interests and generous and kindly in his nature. His children were sickly and died, and his wife made constant opposition to his schemes, as tending to take his attention from providing his family with the necessities of life.

The story of Mrs. Drawbaugh (*Add. proofs, p. 221*) presents a picture of the man as he appeared in domestic life, so naturally drawn by this plain woman, that it carries conviction of its truth in every particular. He was negligent in money matters, and when he had money "he would give away the last cent." She refused to sign the deed when Drawbaugh wished to sell their little home, to put money into the Talking Machine. (*Id. p. 225.*) There is a vast amount of testimony as to his poverty, in addition to Mrs. Drawbaugh's, abounding in illustrations, to which we only briefly refer.

HIS POVERTY.

He was manufacturing his patented stave machinery, at the outbreak of the war, and his machines, sold at the South, remained unpaid for, and left him with his liabilities at the North. He was thereby bankrupted. (*D. vol. 2, p. 843.*)

The testimony of the witnesses as to his financial condition from that time until 1876 is here barely referred to. Daniel Drawbaugh (*II, 843, 844*), John B. Drawbaugh (*D. Vol. I, pp. 594, 595*). For half of his faucet invention in 1866-7 he received a note for $1,000, which he had discounted; the maker failed to pay, and it passed into judgment and became a lien upon his property. *(*D. Vol. 2, pp. 866, 867, 868.*) His father and mother were helpless and poor, and when he received the money from this discount, he, with his brother Henry and brother-in-law, united in buying a home for them, applying all the money. Nothing of this property so purchased for the old gentleman ever came back to Drawbaugh, and when his father died Daniel was unable to assist in paying his debts.

He became a member of the company with five of his neighbors, and sold his patent right for pumps to them for $6,000. He was to receive for himself $5,000, and a sixth interest in the stock. December 5, 1870, it was decided to suspend operations, and the business was closed out. No dividends were ever declared (*See Gorgas, D. Vol. 1, p. 647; see Vol. 2, pp. 1,147, 1,148; Gorgas, Id. pp. 649, 653.*) Large assessments were made upon its members during the period of its operations. Of the $5,000 Drawbaugh received a portion of it in cash and the balance in notes from the other members, which notes were paid along from time to time, during 1867 and 1868. The assessments upon him amounted to $2,186.33. (*Gorgas, Vol. 1, p. 651.*) He actually paid in cash to the company in assessments $1,210. During the business of the company he was employed as superintendent, but received all told from 1867 to 1871, less than $175 for that work. He purchased the dwelling house and blacksmith shop with the proceeds of the sale of the pump patent, in the fall of 1867, for the price of $2,310, on which he paid $2,000. At about the same time he paid old debts to the amount of about $1,000 out of the same fund (*D. Vol. 2, p. 843; Taylor, D. Vol. 1, pp. 633, 634.*) A lien of $300 was left on the new homestead (*Id. p. 842*). He put repairs on the house, estimated at three or four hundred dollars. He also contributed for his parents, besides the $1,000 above referred to, not less than $400, so that of all he received from 1867 to 1870, a balance was left him of $269.27 for the support of his family in a period of nearly four years, besides what he took in in his little work in the shop and from renting a portion of his house to Daniel Fettrow, for which he received $80 in 1868 and $110 after that. During this period he had no other financial resources (*D. Vol. 2, p. 845*). Instances of his borrowing and of his poverty are related (*D. Vol. 2, pp. 845, 846, 847, 848, 849*). His venture in building hydraulic rams was a failure. (*See Sadler, C. Vol. 1, pp. 1036, 1054*). During the period from 1870 to 1873 he was subjected to extraordinary troubles, both financial and domestic. In November, 1871, two of his children died, and for a long time thereafter he had another child ill and so emaciated by disease as to be a curiosity to the people (*Dr. Bowman, Vol. 1, p. 612; H. F. Drawbaugh, Id. p. 402; Com. Vol. 1, p. 905*). Another child was an invalid (*D. Vol. 1, p. 402; D. Vol. 2, p. 751*). He was too poor to procure medicines (*H. F. Drawbaugh, D. Vol. 1, Ans. 52, p. 402*). He was not able to pay the physician who attended the family and was sued by him February 10, 1873, for a bill of $122.67, (D. Vol. 21, p. 851, and record of judgments in D. Exhibits, 151–2). July 9, 1873, he received

---

*See opinion to the points that he was a mere surity.

$425 from the distribution of the proceeds of the sale of the company's property. From this he immediately paid $45 on Dr. Bowman's judgment, and nearly all the balance was paid out on the Neidhammer judgment of $300 and interest, which had been standing for six years. In 1874 the partnership of M. M. Grove & Co., was formed, for the manufacture of axles. It was dissolved in 1876. They employed Daniel Drawbaugh, to some extent, from May, 1875, to March 31, 1876. Paid him in 1875, $310.22; in 1876, $143.84. During this period, from 1869, in April, to this date, he had been desirous of selling his homestead, but his wife refused to sign the deed, except for the purpose of purchasing another. She had always been bitterly opposed to his experimenting and inventing, instead of giving his attention to mechanical labor. (D. Vol. I., H. F. Drawbaugh, 401; H. K. Drawbaugh; Id. 567; Holsinger, Id. 365; Brenneman, D. S. Reb. 106; Mrs. Brown, Id. 164; Springer, D. Vol. I, 186; Chellis, Id. 526; Fettrow, Id. 374–5; Mrs. Drawbaugh, Add. proofs, 221.)

He then conceived the idea, in 1875, of going to Mechanicsburg, five miles distant, to get other employment, and he bargained with his tenant, Daniel Fettrow, to sell him the Milltown property for $2,200, clear of incumbrance. Fettrow had the title examined, found a $1,000 lien upon it, and paid Drawbaugh, on getting the deed, at different times up to April 1, 1876, $1,200. At the same time a house was purchased in Mechanicsburg for $1,740, of which $1,000 was paid in cash April 1, 1876, the balance to be paid in three annual installments, secured by judgment notes. (Fettrow, C. 371; D. Drawbaugh, D. Vol. 2, 854–6.) This left Drawbaugh $200, and he had not a cent of it left after paying it out on his debts. (Id.,

p. 859.) His general financial condition is shown by Renecker's testimony. (D. Vol. 1, p. 236; Hertzler, D. Vol. II, 701; Shettel, D. Vol., Id. 211, 213; George Leonard, D. Vol., Id. 1200.) On March 13, 1877, he bought two pigs from John Rennart at public sale, for $15, and he was obliged to give his note and get his brother John to endorse it for the amount. (D. Vol. 2, p. 836.) On April 1, 1876, the execution on the Good judgment (D. Exhibits, p. 35) was returned *nulla bona* Frees and Yetter testify to illustrations of his poverty (D. Vol. I, pp. 132–35, 135–38.) Village Constable Shank testifies instances of his poverty. (Id., 29, 31.) As do Zacharias (Id., p. 50), Carl, the butcher (Id., p. 159), Scherich, insurance agent (Id., pp. 180–1), I. D. Kahney (Id., p. 204), C. Eberly (Id., p. 117), Smyser (Id., 78–9), Baylor (Id., p. 153), Snyder (Id., p. 515), Smith (Id., p. 340), Condry (Id., p. 142), Brooks (Id., p. 44), Baisley (Id., pp. 194–5), Bricker (Id., 511), Bates (Id., 419), Herr (D. Vol. 2, 668), Wolf (Id., p. 675), M. Fry (D. Vol. I, 182–6), Good (D. Vol. I, p. 199), Dellinger (Id., p. 443), Milner (D. S. Reb., 514), Kline (D. Vol. I, 627), Clifford (Id., 516), Clendenning (Id., p. 523), Hamacher (Id., p. 293), Chellis (Id., p. 525), Millard (Id., p. 331), Hiler (Id., p. 383), Kohler (Id., p. 545), Geo. W. Drawbaugh (Id., p. 603), Jeffries (D. Vol. 2, p. 684).

Though an active inventor, yet from the year 1867 he applied for no patents until the time when the Clock Company and Chellis furnished the money for the faucet and clock patents in 1878 and 1879. For a list of all his patents to the year 1880, see D. Exhibits 82, 97. It is almost beyond belief that this record should be attacked by specious arguments and assumptions in the effort to break down the evidence. The assumption that all the money required was the mere fee for getting the invention patented is absurd on the face of it; but even this money he never had at hand. It would almost seem unnecessary to support the theory that Drawbaugh was poor, by doing more than cite the public records of the county.

Certain it is that those records should preclude any assertion that the theory of poverty was formulated to fit the case. Judgments are a lien upon real estate in Pennsylvania, and defendant's book of exhibits shows the following liens upon the equity of redemption—it can hardly be called the ownership—in the homestead:

April, 1868, to May 3, 1869, $310, interest and costs.

May 3, 1869, to Mar. 26, 1870, $1,810, interest and costs.

March 26, 1870, to May 17, 1871, $910, interest and costs.

Nov. 17, 1871, to Jan. 11, 1872, $910, interest and costs.

Jan. 11, 1872, to Feb. 20, 1873, $1,910, interest and costs.

Feb. 10, 1873, to March 17, 1873, $2,022.67, interest and costs.

Mar. 17, 1873, to July, 1873, $2,113.49, interest and costs.

July, 1873, to Dec. 18, 1875, $1,805.49, interest and costs.

Dec. 13, 1875, to April, 1876, when the house was sold to Fettrow, $1,833.30, interest and costs. (*Defendant's Exhibits, p. 26, et. seq.*)

It will thus be seen that during the whole time of the ownership of the two pieces of property it was incumbered, sometimes to its full value, and that the credit they gave to Drawbaugh he was forced to use to its fullest capacity.

Notwithstanding the undoubted testimony that his wife refused to join in utilizing the equity in the property to raise money to put into the talking machine, it is gravely urged against Drawbaugh that his story is improbable because he did not sell the homestead, to raise money to introduce the telephone.* But the court below says, in effect, that the story of his poverty was a fabrication formulated in the answer. The answer was "formulated" and filed in January 1881. The complainants' witness, Matthews, of whom the learned judge speaks most approvingly in the opinion, in his Baltimore American article (*I Comp., p. 541, 543, top*), in speaking of the impression made upon his mind by a visit to Drawbaugh in April, 1878, says: "This unlettered country mechanic came very "near anticipating Edison and Bell in the invention of the "telephone. *Nothing but his poverty prevented him from* "*conducting his experiments to a successful issue.*"

And the court below says that Drawbaugh is "dishonest" in his pretense of poverty!

WAS DRAWBAUGH A CHARLATAN?

The able opinion of the Circuit Judge is exhaustive in its treatment of Drawbaugh as a conspirator, a perjurer and as a general fraud.

We have discussed the evidence upon which this theory rests, with the exception of that on which this charge rests. It is found in J. C. Nesbit's testimony (*1 Comp. 687*), in "The History of Cumberland County, Pennsylvania, by Rev. Conway P. Wing, D.D., and others, 1879," published by the Herald Printing Co., of

---

*See opinion, p. 16.

Carlisle, Pa., and containing at p. 200 of said publication an article headed, "Lower Allen Township, by J. C. Nesbit."

The court assumed that the biographical sketch (I Comp. p. 705) was written by Drawbaugh himself; but it appears distinctly on the defendant's cross-examination of the witness and the production of the original manuscript, which was under the control of the complainants, and not by them at first produced, that it was in the writing of Hull. It even left the date of Drawbaugh's birth blank, which was supplied in the published article.

Now, the main facts in this biographical sketch are undoubtedly truthful, as is shown by the whole record here. The florid style of the article, on which alone the charge of charlatanry is based, is evidently that of the provincial newspaper man, and entirely foreign to Drawbaugh's. It abounds in terms not possible to Drawbaugh, as shown by his simple methods of thought and expression in the 332 pages of his deposition, which conclusively answers this last attempt to picture his opposite as Daniel Drawbaugh.

V.

A BRIEF SKETCH OF THE CONCEPTION AND PROGRESS OF DRAWBAUGH'S TELEPHONE.

He himself says he cannot remember the date when he began to study the subject, and that "it was a long while ago." He had experimented with the vocal organs by placing his hand upon the throat and feeling the vibrations of the vocal chords, and the fact that sound had the effect to set up vibrations in solid substances he had learned by noticing the effect upon the surface of partitions, and by experimenting in the effects produced by extending a light wooden bar between partitions, and then by causing a vibration upon one partition, discovering that the bar transmitted the same vibration to the opposite partition. He pursued the principle always, that the current must not be broken, and from the first his conception was of a continuous current.

His idea of pulverized matter is, in this connection; interposed in the current, not breaking it, but causing a greater or less flow, as the particles form a greater or less resistance to the passage of the current as they might be pressed together with more or less force. He speaks of conversing with medical students at Washington, D. C., about the transmission of sound as long ago as January, 1861, the date of the visit being fixed positively by a receipt taken in Washington *(D. Vol. 2, p. 752)*, and states that he then had his mind employed on the subject.

Henry B. Averly *(D. Vol. 1, p. 184)* testifies that between 1861 and 1864, and during the war, Drawbaugh, in the mill office (Averly's grist mill), in the presence of several witnesses, including the witness, spoke of attaching an instrument to the office in the mill, by which he could hear all that was going on there without leaving his house. Averly moved away in 1873, in May, and has never been to the county since, and Drawbaugh moved out of that house in April, 1868, and never again lived in it while the witness was a resident of Cumberland County.

In the argument below counsel for complainants said of David Stephenson, resident of Harrisburg, that he was a machinist, and " worked for and with the Faucet Com-" pany (of which Drawbaugh was superintendent), as a " maker of patterns, in 1867 and 1868, and that he and " Drawbaugh had many and intimate relations with each " other ever since. They appear to have been partners or "jointly engaged in the manufacture of certain pnmps. "He has been and still is a friend of Drawbaugh's. Now, "here is a machinist and a machine-shop man, a keeper of "machinist's supplies stores, intimate with Drawbaugh, "having worked for him in his shop—quasi-partners. " * * * If there was a telephone there he must "have known everything about it; but they did not put "him upon the witness-stand." (*Complainants' Argument*, "*pp. 201, 202, and quoted in witness' testimony*). In the Additional proofs taken in the "*Overland*" case, this gentleman, who is highly spoken of, was put upon the witness-stand, and he testifies that he *did* know all about Drawbaugh's Electric Speaking Telephone; that Drawbaugh showed it to him while Drawbaugh lived, in that house close to the grist-mill, during Drawbaugh's first occupancy of that house, which occupancy terminated in the spring of 1868. He shows that Drawbaugh repeatedly experimented with the instruments, with his assistance. He shows that the instruments were connected by wires, and that the wire came from the outside of the building from a porch, and that the wires ran zig-zag (back and forth) "to give length to the wires," and that Drawbaugh told him it was operated by electricity. He talked through the instrument from one room to another. Later, in 1874–5, he says (*Add. proofs, p. 145*): "He sent me to the cellar, "and after giving me a small instrument in my hand, he "suggested that he would go onto the upper floor and "speak to me and I should let him know what he said, and "how distinctly I heard it. * * * I heard him speak- "ing short sentences and singing, and then went up-stairs "and met him coming towards me, and told him what he "said. I heard him very clearly, and I didn't miss any

" words in repeating what he said, excepting his singing; I " didn't repeat that.

Q.—" How did the sounds, heard through the machine " that day, compare in loudness and distinctness with those " which you heard through the old machine at the shop at " the grist mill, as you have testified?

A.—" With more force and clearness at that last " time."

He is corroborated as to the later dates by his daughter.

We have the testimony of Prof. Samuel B. Heighes as to Drawbaugh's great interest in physics and particularly in electricity and of his talking of speaking through an electric wire by electricity in 1859 and 1860, and witness *saw* the telephone there in 1871-4. (*D. S. Reb. p. 91*).

Mr. Lory, a carriage-maker, (*D. Vol. 1, pp. 225-7*), says that Drawbaugh told him in 1864 that he was about making a machine to talk through a distance of twenty miles; it would work like a telegraph, but that you would have to talk into it. Witness had understood that Drawbaugh had conceived it and had plans made and was going to make the machine. Witness was never at Drawbaugh's shop since that fall. The date is fixed by the witness being at the grist mill to fix Christian Eberly's buggy wheel, and John B. Drawbaugh fixes the date by a book of entry. (*D. Vol. 1, p. 85.*)

Samuel H. Bates (D. S. Reb. 380) testifies to a talk about Drawbaugh at that early period, and of his claim of inventing a talking machine.

Mrs. Mary Ann Darr testifies to having heard Drawbaugh's talking machine talked of in 1866, before her daughter worked in Drawbaugh's family. Same point of date, 1867, Christian Eberly (D. Vol. I, pp. 113-14).

James A. Smith, the postmaster at New Cumberland, of the date of 1866. He moved away in 1867, and he states that Drawbaugh told him that he and his daughter Emma had talked together with a floor and two partitions between them. The daughter referred to died November 18, 1871. (D. Vol. I, p. 751.) Drawbaugh himself is corroborated as to the form of the instrument, by Lory (*supra*), who testifies his first telephone apparatus was a teacup, and thinks he had that machine before he took out his two faucet patents, November 20, 1866, and knows that he then made his shop in the old clover mill now occupied by him. The date of this removal is fixed at 1867.

The teacup transmitter is not in existence, but its construction and mode of operation are set out by Drawbaugh (*D. Vol. 2, pp. 756, 764*), and is illustrated by the sketch on page 788, and illustrated by another sketch of its construction and of its use in a battery circuit on page 795.

Here was the principle of the telephone, and of the carbon transmitter, beyond any sort of question, though the low conductor used at first was not carbon, but was of earth and of other materials. He cannot fix the point of the evolution at which he can describe exactly what he used as a receiver at first, as he was repeatedly experimenting, trying one thing and another, and the first that he is able definitely to describe is shown in the sketch on page 762 of his testimony.

The early experiments prior to 1868 are further shown by the following witnesses ; Mrs. Jane M. Brown, (*D. S. Reb. 163-170* ; Mrs. Darr, (Id., p. 110) ; Mrs. Brenneman, (Id., p. 309); Samuel Snell, who remembers an experimental telephone line from the shop to the office of the grist-mill in 1867. (*D. S. Reb., pp. 412-18*). The witness had never been in Milltown to stop since the day he saw that machine in 1867. By James Davis in 1867, after harvest, when Drawbaugh's shop was in the clover-mill. (*D. S. Reb., pp. 418-421.*) George B. Eyster, sheriff of Cumberland County, (*D. S. Reb., pp. 890-91*), was at the clover-mill in company with Geo. B. Heck, who died in July—see Barber, (Id., pp. 272-3); Natcher, (Id. p. 150). By John B. Heck, (Id., p. 192), who looked at some of Drawbaugh's inventions. By Henry Kilmore, (Id., pp. 1,124, 1,128) of 1867, who saw talking machines right back of grist-mill, in company with Michael S. Drawbaugh —who died March 16, 1871. (*Date of death fixed by Kilmore, Millard, Adam Drawbaugh, Id., pp. 1040, 1,098, 1100*).

By Jacob A. Graham, (*Id. pp. 1,357, 1,069,*) as of 1867.

By Geo. Murphy, of Newville, of Ahl & Sander's distillery, from Nov. 22, 1866, to June 1, 1867, (*Id. pp. 1,063, 1,066*).

By John S. Dougherty, merchant of Newville, (*Id. pp. 1,131, 1,134*), as of 1867.

By Wm. Darr, one of the complainants' rebutting witnesses, (*C. Vol. I., p. 358*). This is the witness who advised Drawbaugh to try Yellowbreeches Creek first, before he tried to talk across the Atlantic Ocean.

By his wife, (*D. S. Reb., p. 110*).

With the exception of the old tea-cup transmitter, (*2 D., p. 756*); representtions of all the instruments are in evidence, in whole or in part; parts of those produced prior to the instrument "I" of 1871 being in evidence, and "I," with all thereafter produced being in evidence in their entirety. The temporary experimental structures, the changes in parts and construction, great and small, in working out the great discovery, are not here, and of the thousand and one efforts made in the progress of the invention, there is no memorandum. We submit, it is not to be conceived that any mere memory could recall them. (*Drawbaugh, D. Vol. 2, p. 828.*) Harmon K. Drawbaugh knew generally of their experimental constructions Henry F. Drawbaugh, (*D. Vol. I, p. 406*).

Faraday's experiments, which resulted in the discovery of the induction current, marked an era in electric science, and to reach it he experimented from 1824 to 1831. He kept a record of his experiments. Had he not, imagine Faraday at a period subsequent to his discovery, attempting to give from memory the first and second, and the myriad of other things, and details, small and great, the smallest of the greatest results, and the greatest of the smallest, during these years leading up to the result. And, yet, one of the strongest criticisms of Drawbaugh appearing in the arguments of counsel, and even in the opinion of the learned judge at circuit, was that he was unable to describe all of his first experiments.

In the series of instruments and drawings produced, the development from one to the other appears to have been perfectly natural, from the loose, pulverized, low conductor, to that of the closely confined, so that the pressure might be rendered more easily adjustable; the evolution from the first rude instrument sketched in Drawbaugh's testimony just referred to, to the tumbler transmitter "F." (*P. 7 of Defts'. Instrument Exhibits.*) In this also is seen the progress to the wooden cover and mouthpiece upon the diaphragm, in which the membrane diaphragm had given place to the metal one. (*Id. p. 8.*)

In experimenting with the receiver we find him abandoning the unnecessary parts in the tin can ".B" (*Id. pp. 2 and 3*), as from the latter is evolved the later and more perfect instrument " C." (*Id, p. 4*). Upon using " C," and finding that it would transmit, though feebly, using " B " as a receiver, he then places a permanent magnet against the heel of the electro-magnet and finds a great improvement, and Exhibit " C " as a transmitter is the result. (*Id. p. 5.*)

In the next improvement in this machine he encloses the parts, and, of necessity, makes them compact. The experimental magnet is then arranged, and from this comes Exhibit " I " (*Id. p. 13*), with its several improvements, until Exhibit " A " is the result; later " C " and " I," still having a large diaphragm, were observed to give out a false vibration, and then he conceived the idea of dampening them to prevent the false vibration, by means of an adjustable rubber pad, and then moved the mouth orifice to one side and applied the dampened pad and screw. This not succeeding, he then determined to reduce it in size, and found the best results. After having made crude instruments to test and settle the matter, and finding his conclusions verified, he reconstructed the two into two compact working instruments, " D " and " E," in February, 1875. (*Id., p. 6.*)

From the time of his discovery that the instrument " B, " as improved in " C ," would act as a transmitter, by application of the permanent magnet, he had thus far proceeded directly in the line of improvement of the magneto transmitter, and had done nothing with the carbon instrument, although he used it quite commonly in connection with his other experiments. At this period, in 1875, he turned his attention again to " F, " the carbon-transmitting instrument. He experimented with carbon, and Halsinger saw him baking carbon composition into cakes (I Defts., p. 366). After experimenting with these cakes in the trial tumbler instrument (Halsinger, Id.) he rearranged them and produced Exhibits "L" and "N," (Id. p. 17 and 18), and combined in them the receiver and transmitter. Then he constructed a pair of transmitters with hard carbon, without combining the receiving mechanism in the same instrument, and from this we have "G" and "O," (Id. p. 7, right; p. 20, left).

The story of Drawbaugh then, and of the record, overwhelmingly corroborated by the witnesses for the defense, is as follows:

Early conception and experiments with the continuous current, 1862, 1866 and 1867.

Teacup transmitter and receiver, 1866 and 1867.

Tumbler and tin cup and mustard can ("F" and "B"), 1867 and 1869.

Improvement upon "B" ("C"), 1869, 1870.

Further improvement upon "C" and the more perfect magneto instrument "I," 1870, 1871.

Mouth-piece changed to center, and adjusting screw inserted (Exhibit "A"), 1874.

"D" and "E," perfectly adjusted and finished magneto instruments, January and February, 1875.

"L," "M," "G" and "O," from February 1875, to August, 1876.

"H," August, 1876.

"J," "N" and "P," 1878.

In connection with the later instruments there is a piece of testimony that seems to us conclusive in favor of Drawbaugh, upon the question of his ability to invent the telephone, and in favor of our theory of the gradual progress of his experiments from the crude instrument, patentable, and a speaking telephone, to the perfected and nicely adjusted one.

It is a matter of history, as well as in the record, that the Blake carbon transmitter is in use upon the most of the Bell instruments at this time. Blake's sworn statement in the Patent Office, in an interference, shows that he never even conceived the Blake transmitter invention until after July 4, 1878, and that he never made a Blake transmitter until late in the fall of 1878. The other side have put in evidence Blake's patent, which was not granted until long after the date of the commencement of this suit, so that by law and by the rules of the Patent Office, Drawbaugh could have got no knowledge from it. It is further in evidence in complainant's testimony (*See Ziegler, Vol. I, Comp. tes., p. 1,032*), that the Blake transmitter instruments were not put into use until the spring of 1880, and that the telephones in use prior to that time were of a form known as the "Phelps' Snuff-box" instrument, and the "Crown" and "Pony Crown" instruments, so that it is not possible, under any conceivable circumstances, that Drawbaugh could have derived any ideas from the Blake transmitter as early as May, 1878. Drawbaugh's perfected carbon instruments "N" and "J," as shown by Stees and Johnson (*Add. proofs, pp. 956, 970*), who testify in the most minute, circumstantial and positive manner, corroborating Drawbaugh in his testimony, were taken to the office of William J. Stees, in Harrisburg, in 1878. They fix the time absolutely beyond doubt, as the 10th day of May, 1878, and that the instruments remained at Stees' office several months. They both identify the instruments positively, and testify that while they were at the office they put them on the telephone line and talked through them, and that they worked admirably; that they saw the instrument, "Exhibit J," and recognize the parts in it just as shown in the exhibit; and Stees further testifies to the important fact, that while the instrument "J" was at his father's office, he took it in his hands to carry it across the office, in order to change its location, when his father accidently ran against him, and he dropped the instrument, and that he discovered at that time that the small, hard carbons which the instrument contained had become loose and fallen out.

William J. Stees is the gentleman whom the complainants show introduced Drawbaugh to the Western Union Telegraph office, to look at a telephone (Ziegler, Comp. vol. I, p. 1,032), and was accidently killed at the very outset of taking defendant's testimony in the case. (Add. proofs, p. 970.)

WHY HE WAS SEEN BY SOME OF THE WITNESSES WORKING WITH THE EARLIER MACHINES AFTER THE PERFECTION OF THE INSTRUMENTS "D" AND "E," ON OTHER EARLIER MAGNETO INSTRUMENTS.

Some of the witnesses testify to seeing the tumbler "F" and the tin-can "B" as late as 1877. But the fact looses all force against the defense, when it appears indisputably proved, and is beyond the ability of conspiracy to have fabricated, that Drawbaugh, on discovering that the magneto receiver "B," as improved and organized in the improved "C" in 1870, would serve as a transmitter, temporarily abandoned the variable resistance transmitters, "F" and "B," and did not return to experiments and progress on them till 1875.* From them, through a series of experiments and improvement, came

---

See Nesbitt sketch of Drawbaugh referring to the two kinds of telephones, I Complt., 706.

finally the perfect carbon instruments taken to Stees' office in 1878, above referred to.

THE TESTIMONY AND THE COMMENT THAT DRAWBAUGH WAS STILL EXPERIMENTING, AND SAID THE MACHINE WAS NOT PERFECT, AT TIMES WHEN DEFENDANTS' EVIDENCE SHOWS HE HAD ACCOMPLISHED THE INVENTION.

Aside from the fact already shown, that he was at work on the magento and carbon instruments at different times, there is a very simple answer which appears incidentally and naturally throughout the record. No effort was made to bring it out, and it appears in the testimony of witnesses, as in that of Drawbaugh, without consciousness on their part or his, that it was of any special consequence.

It is this: That the instrument in his view "was not loud enough for practical purposes" (*Drawbaugh, II Dfts. p. 1058, X. Q. 1612*), unless it would talk, without holding to the ear, and convey the sound as far as ordinary speech. He wanted it to talk out as a man talks.

As George Free (*Dfts. I., p. 488*) puts it of his conversations with Drawbaugh in 1876, 1877, 1878 and 1879: "He told me that he wanted to accomplish, and could do "it, to make a machine that you could stay in one corner "of the room, and putting the machine in the other "corner, and hear as distinctly as putting it to the ear," and that Drawbaugh told him that he had not done it yet, but "I am working at it and I am going to get it accomplished." See, also, Drawbaugh, D. Vol. 2, pp. 805, 829, 830, *et seq.*, and Jeffries, Id. 679.

When that journal of civilization, the *New York Tribune*, thought the only use of the telephone would be for "diplomats and lovers," (*C. Vol. I, 1, p. 250*); when the *Scientific American* summed up the public opinion of it as "a beautiful scientific toy," (*C. I., p. 273*); when Gardner G. Hubbard, a telegraph manager, and Prof. Bell's financial backer, "did not then believe the transmission of speech could be made commercially valuable." (*C. II., p. 1662, and Complts. Exhibits p. 959*); when President Orton, of the Western Union Telegraph Company, ignored it from 1876 to 1878 (*C. I., p. 270*); when all his friends laughed at him; it cannot be wondered at that Drawbaugh, in the little village of Miltown, years before, should not have realized that his instrument~~s~~ had reached practical perfection when it would talk, only by holding the receiver to the ear.

OF THE CRITICISM THAT DRAWBAUGH DID NOT MAKE KNOWN HIS INVENTION TO HIS ASSOCIATES IN THE SHOPS WHERE HE WORKED.

This charge, like many others, has nothing to rest upon.

The Axle Company carried on business at the shop now occuied by Daniel Drawbaugh. It was composed of M. M. Grove, Wilson Baer and Captain J. A. Moore. It commenced business on the 23d day of December, 1874, and dissolved on the 29th day of February, 1876. All three, Baer, Moore and Grove, testify to their knowledge of the talking machine (*D. I. 614, 635, 662*) during the operations of the company, and as we have seen, Drawbaugh applied for assistance to all of them.

Of the old Faucet Company, which commenced business in 1867, the secretary and treasurer, Dr. N. B. Musser, is dead; but it appears by the testimony of Prof. Samuel B. Heighes (*D. S. Reb., p. 95*) that Musser was with him at the examination of the talking machine in May, 1872. Musser was his brother-in-law. W. R. Gorgas, a bank clerk, now thirty-three years of age, residing at Harrisburg, testifies to the fact that the Faucet Company was a failure financially; that he left the shop in September, 1869, and took very little interest in the affairs of the company. He is not called by either party on the point of knowing anything about the talking machine. He testifies that he was sick of patent rights through the failure of the Faucet Company. He remembers that Drawbaugh came to him and wanted him to take a half interest in some invention, he forgets what; but as the witness had lost about $4,000 in the old company, he "had had a surfeit of it and didn't pay any attention to it." (*D. S. Reb., p. 1128.*)

John F. Hursh was a member of the old faucet company until 1871, and he testifies that he didn't know of the talking machines. For the value of his testimony we have no comment to make, save to cite his manner of testifying. (*I. Comp., p. 1060.*) "Q. 50.—Are you able to swear "that, as a matter of fact, Drawbraugh did not have elec-"tric speaking telephones in his shop for at least seven or "eight years prior to 1876, and show them to a great many "different persons during those seven or eight years? A.— "I am — that he did not have them. Q.—Do you swear "that positively? A.—I do. Q.—How many times were "you in Drawbaugh's shop in 1876, prior to your buying "the ram? A.—I can't say. Q.—How many times were "you in the shop in 1875? A.—I can't say. Q.—How "many times were you in the shop during the year 1874? "A.—I can't say. Q.—How many times were you in the "shop in 1873? A.—I can't say. Q.—How many times were "you in the shop in 1872? A.—I can't say. Q.—How "many times were you in the shop in 1871? No answer. "Q.—Do you remember any particular occasion of being "at the shop in 1872? A.—I don't. Q.—Do you re-

" member any particular occasion of being in the shop in " 1873? A.—No, sir. Q.—Do you remember any particular occasion of being in the shop in 1874? A.— " No, sir. Q.—Do you remember any particular occasion " of being in the shop between 1876 and the time you " ordered the ram? A.—No, sir. * * * Q. 69—Mr. " Grove, one of the members of the Axle Company, has " testified, after they went into business at Drawbaugh's " shop, which would bring it at a period early in 1875, he " saw a talking machine in Drawbaugh's shop; I suppose ' you don't know what Grove did or did not see at Drawbaugh's shop? A.—I could not tell about Grove; I don't " know. Q.—Mr. Baisley has testified that in Nov., 1875, " he saw talking machines in Drawbaugh's shop; I suppose " you don't know whas Baisley saw or did not see, do you? " A.—I don't. Q.—Mr. D. W. Smith has testified that " in 1874 he saw a talking machine in Drawbaugh's shop; I " suppose you don't know what he did or did not see, do you? " A.—No, sir. Q.—The same question as to Samuel S. " Crawford? A.—I don't. Q.—The same question as to " George L. Hale, in 1873? A.—I don't. Q.—The same " question as Henry Baylor, in 1873? A.—I don't. Q.— " The same question as to Smyser? A.—I don't;" and so on through the instances of the various persons who had sworn they had seen the telephone. " Q. 64 (p. 1,062)— " Are you willing to swear, as a matter of fact, Drawbaugh " did not have talking machines in his shop at least four " years prior to the beginning of the Centennial year, 1876, " and show them to many different persons during those " four years? A.—I am."

Now, here is a witness to depend on. He is a partisan, and he swears for his side, without regard to consequences.

Jacob A. Shettel, a member of the clock company, testifies, and fully and positively corroborates Drawbaugh. (D. I., p. 206.)

Emanuel A. Gregory, a member of the old faucet company, and his son Joseph, who both worked in the shop, fully and positively corroborate Drawbaugh. (Add. proofs, p. 181–5.)

John C. Schrader and E. B. Hoffman, and David Stephenson, hereinbefore referred to, connected with the faucet company, give the strongest possible testimony for the defense. (D. S. Reb., p. 467 ; D. I., p. 481; Add. proofs, p. 140.)

In the Axle Company, the work was largely done by Daniel, H. K. and J. B. Drawbaugh (*D. I. pp. 575--98*). Daniel Fettrow, John Wolf and Augustus Kahney (*D. I. pp. 347, 266--73; S. Reb., p. 254*), all testify to a perfect familiarity with the work on the machines and the machines themselves.

Theodore Grisinger (*I Comp., p. 511*), a member of the Clock Company, testifies for the defense. The Clock Company started in the spring of 1878. He testifies to a conversation with Drawbaugh in the spring or summer. The tendency of his testimony is to show that there was no telephone there, and that Drawbaugh was merely experimenting. Inasmuch as he swears he did not see Exhibits "F" and "B," and swears that, as a fact, he could not have seen them and have forgotten them, while we know that they were there, from the complainants' testimony, and they are admitted to have been there in 1876 and 1877, as we have seen. We submit his testimony is of no weight. He did see two telephones at some time, and says that he has seen Exhibit "A" somewhere, and must have seen it at Drawbaugh's shop.

The other member of the Clock Company is dead.

Jacob Carnes (*Comp. I, p. 883*), worked in the machine shop at Eberly's Mills for the Drawbaugh Manufacturing Co., from 1868 to 1871, and boarded in Drawbaugh's family. He testifies that he did not see any telephone and never heard that one had been invented *previous to 1880*. He is thoroughly contradicted by Mrs. Margaret Brenneman, (*D. S. Reb., p. 103*), who lived in the family at the time Jacob Carnes was a boarder there, and she is corroborated by her mother, Mary M. Darr (*Id., p. 109*), and by John C. Schrader, who boarded with him, *supra*. Of course, his testimony is absurd, because it is beyond question, and is admitted on all hands, that all the telephones were made prior to 1880.

VI.

DEFENDANTS' TESTIMONY.

We now refer to the testimony of the members of the community at and about Eberly's Mills, of the visitors there, and of former residents of that place, covering the period of Drawbaugh's history of his invention of the telephone, and of the various stages in its improvement.

WILLIAM H. ZEERING.

(D. S. Reb., p. 122): Age 41; Shiremantown; farmer, also Secretary of School Board of Lower Allen township. In the fall of 1873, witness went to Drawbaugh's shop to get a pair of steelyards re-lettered. He testifies that he took them there, and Mr. Drawbaugh looked them over and said he would re-letter them, and that witness should call in the course of a week or two, and he would have them finished. Witness testifies that several years before the time mentioned he had been at Drawbaugh's shop, and the latter had shown him a talking machine; but witness considered it "rather of a humbug," and so expressed his opinion to Drawbaugh. When witness went to get his steelyards, Drawbaugh again showed him his talking machine and talked through it to him, witness listening at the north-east corner of the building, on the third floor, and Drawbaugh talking somewhere down-stairs. Part of the conversation — and a very striking part — witness remembers, namely, that he heard through the machine the words "the steelyards are finished." The door of the room was closed, and witness could not have heard the words, except through the talking machine. The date of this occurrence is positively fixed by a book entry which the witness produces, as follows: "Nov. 25, for re-lettering steelyards, per (D. Drawbaugh) 35," and the testimony of witness that this was the only time that he ever had a pair of steelyards re-lettered by Drawbaugh. The witness further testifies that after hearing those words he considered the invention a success, instead of a humbug; and it is very natural that after the opinion which he previously formed of the instrument, and his distinct hearing through it of the words relating to his particular business at the shop at that time, that they should be indelibly impressed upon his memory. Whilst witness does not positively identify the instrument through which he heard these words, he says that "B" looks like the instrument which he saw when first at the shop, and "I" like the one he saw when the talking took place.

DR. C. B. UPDEGRAFF.

(*D. Vol 2, p. 1081*): Age, thirty-eight; residence, Philadelphia; formerly resided at Harrisburg; made three visits to Drawbaugh's shop, first on the 5th or 6th of May, 1874, and the second and third, as the witness supposed, in *April* and *May* — but as it subsequently appeared, in June, 1875, but certainly in the spring or summer of the year following, after the first visit of 1874. (See Boyle, Add. Proofs, pp. 45-6, Ansrs. 19, *et seq.;* Stackpole, Id., p. 73, *et seq.*, Ansrs. 18, *et seq.;* George F. Weaver, Jr., Id., p. 101, Ans. 5.)

The date of the third and last visit is fixed beyond all question by the testimony of numerous witnesses, besides those referred to. (*Add. Proofs, pp. 36, 113.*)

Witness has no recollection of ever having been at Drawbaugh's shop after the third visit, and left Harrisburg and went to Philadelphia early in the spring of 1876, where he remained all through the Centennial year. He removed his family to Philadelphia in 1877 and has ever since resided there. During the 1874 visit he saw the talking machines. Identifies "B," "C," and "I" and possibly "A," as seen at that time. During his second visit, which occurred early in June, 1875, he saw "D," "F," and "B," in addition to those mentioned before. His identification of "D" and "E" is very striking. He was a physician and surgeon, and had made a specialty of the eye and ear. He conversed with Drawbaugh on the internal organization of the ear, and testifies that the latter had an instrument which particularly attracted his "attention on account of the peculiar shape of the magnet. I had never seen anything like it before. It had a magnet of a peculiar shape. * * * It resembled the ear — the external part of the ear—in shape." It does not appear that he heard any talking through the telephone at his first visit; but he did at his second visit, and distinctly understood what Drawbaugh said to him through the talking machine. Witness cannot identify machines which were talked through, inasmuch as he handled them all, and cannot remember distinctly which ones were used. On this third visit he also saw talking machines, but did not listen to any speech through them.

The testimony of this witness is also important, as representing the enthusiasm of Drawbaugh in his invention, his confidence in its future utility and its electrial operation.

He is corroborated with regard to the dates of his visits by Thomas Updegrow (*D. vol. 2, p. 1,098*), John Henry Smith (*D. vol. 2, p. 1,093*), and by a number of witnesses hereafter alluded to.

In the argument at New York his dates were attacked mainly upon two grounds: first, because he testified that on this second visit he, in company with Boyle, floated down the Yellow Breeches Creek from Zacharias' Mill to Drawbaugh's shop—John J. Zacharias having testified that he lived at New Cumberland Mills, at the mouth of said creek, from the fall of 1868 to the spring of 1876. (*D. Vol. I, p. 48, Ans. 9; pp. 50, 51, Ans 39.*) Second, upon the ground that there was no store at Eberly's Mills in the spring and summer of 1875; Smith, who accompanied witness on the third vlsit, having testified (*D. Vol. 2, p. —, Ans. 3*), that he went to a grocery store at Eberly's Mills to get some things which were necessary for breakfast; but in the testimony which was brought forward in the Overland case, these criticisms were entirely overcome, first, by showing that John J. Zacharias was mistaken as to the date when he left the New Cumberland Mills, Elias Hake, the owner of the mill above Eberly's Mills (Add. proofs, p. 107, *et seq.*), producing a lease from himself to John J. Zacharias of his mill, dated March, 1875, for the term of one year from

April 1, 1875, and testifying, that under that lease Zacharias went into possession of his mill on the first of April, 1875; and, second, by the testimony of Jeremiah Fry (Add. proofs, p. 120), who testifies, that from March, 1875, up until October 1, 1875, when her husband opened a grocery store there, Harry Gardner, postmaster at Eberly's Mills, kept for sale a few grocery supplies, such as sugar, coffee and matches.

The testimony of this witness is further corroborated by the depositions of Updegrow (D. vol. 2, p. 1,098), J. H. Smith (D. vol. 2, p. 1,093), McGaffick (Add. proofs, p. 36), Breneizer (*Id.* p. 40), Boyle (*Id.* 44), Stackpole (*Id.* 72), Irwin (*Id.* 81), John H. Updegraff (*Id.* 83), Goldsmith (*Id.* 91), Strouse (*Id.* 93), John Young (*Id.* 97), George F. Weaver, Jr. (*Id.* 101).

M. P. SMYSER (D. vol. 1, p. 74): Age, fifty; residence, Lisburn, Cumberland County; auctioneer; was employed at the State Arsenal, Harrisburg, from June 1, 1870, till June 30, 1873 (see Diven, D. vol 1, p. 74), during which time he occasionally visited Drawbaugh's shop, on his way to and from Lisburn, where he then resided. During 1871, or 1872—not later than 1872—when he was fearing discharge, because of change of State administration, he stopped at Drawbaugh's shop with reference to a magic lantern which he contemplated exhibiting, in event of his discharge from service at the arsenal, witness being a crippled soldier, who had lost an arm in the Battle of the Wilderness. At this time Drawbaugh exhibited to him instruments "B" and "F," "F" being in the cellar, and "B" on the upper floor of the shop, two stories above, and the instruments being connected by two green cords similar to the wrapped wire of the electro magnet of "B," as now in evidence. Drawbaugh directed a boy to sing and talk in the cellar whilst he and witness went up stairs and listened at "B." So listening, witness distinctly heard the boy sing "Don't you want to be a Christian while you're young?" Not only distinguishing the music, but understanding the words. Drawbaugh thereupon opened the door and called down to the boy to whisper, whereupon witness heard the boy count "One — two — three — four — five," in a whisper. The doors were closed between the cellar and the upper floor. Drawbaugh told witness at the time that the instrument was operated by electricity, and that he could make a talking machine that could talk from there to California.

The evidence of this witness is further important as showing a continuous subsequent work of Drawbaugh on these instruments.

ISAAC B. MILLARD (*D. Vol. I, p. 324*):

Age, thirty-six; residence, Newberry Township, York County; farmer. (President of school board.) Was married November 11, 1869, shortly before which time he lived for awhile at Eberly's Mills. Moved to Harrisburg December, 1869, and continued to reside there until August 20, 1874, when he moved upon a farm in Newberry Township, York County, purchased by his father-in-law, and there continued to reside up to the time of testifying. Whilst living at Eberly's Mills, before his marriage, saw "B," and heard some one—he cannot remember whether it was Drawbaugh or some one who was with him at the shops—talk through it. Witness listened at "B," on the second floor of the shop, the person doing the talking being on the hill or bank outside of the shop and some distance away. Heard and understood. About the time witness moved upon the farm, and prior to the opening of the

Centennial, he saw at Drawbaugh's shop other talking machines, which he identifies, particularly "A," "D" and "E," through all of which Drawbaugh talked to him. When experimenting with "A," witness used it as a receiver in the upper story of the shop, Drawbaugh talking in the basement. Witness heard and understood what was said through it. When experimenting with "D" and "E," conversation was carried on both ways, witness using one of the instruments, both as a receiver and transmitter, and thus carried on conversation with Drawbaugh, so as to be mutually understood. The last of these experiments was made in cold weather, prior to the Centennial. Witness did not again visit Drawbaugh's shop until February or March, 1880.

Witnesses who talked through telephone:

ABRAHAM B. SHANK.

(*D. Vol. I, p. 19*): Age, forty-nine. Constable of Lower Allen township, Cumberland County, Pennsylvania, for the last seventeen years. First saw talking machine at Drawbaugh's shop "about in 1869" (Ans. 4). Fixes date by removal to new residence in spring of 1870 (Ansrs. 73, *et seq.*) Listened at "B" whilst Drawbaugh talked into "F." Understood and distinguished Drawbaugh's voice. Describes missing parts of instruments. Subsequently, at various times, heard Drawbaugh talking from floor to floor through different instruments.

This witness testifies to the electrical character of the instruments at the time he first saw them, in that they were connected by two wrapped wires. His deposition is also very important on other points, including the poverty of Drawbaugh, his continuous work upon the talking machine, its electrical character, etc.

WILLIAM J. MACLAUGHLIN. (*D. S. Reb., p. 750*):

Age, fifty-six; Harrisburg; painter and paper-hanger. Was at Drawbaugh's shop in company with E. B. Hoffman at the time of the great flood along the Yellow Breeches Creek in August, 1875, and saw and heard Drawbaugh speak through his talking machine; does not identify instrument at which he listened, but selects "I" as one, or similar to one, which he saw there at that time; Drawbaugh was up stairs and witness down stairs; talked both ways; understood and remembers words. Drawbaugh asked me through the machine "if I could understand him." I answered him, "Yes."

There can be no doubt as to the time of this visit. The flood on the Yellow Breeches Creek in August, 1873, is overwhelmingly established by the testimony of many witnesses, and is admitted by the complainants upon the record. (*See Complainants' vol. 3, top of p. 1,925.*)

JACOB H. RENEKER (*D. vol. 1, p. 233*):

Age, 50; residence, Lower Allen Township, near Eberly's Mills; farmer. Moved to present residence March, 1875. In May, 1875, visited Drawbaugh's shop and saw a number of talking machines there. Identifies "B" and "F," and thinks he also saw there at that time "A" and "C." Drawbaugh then and there talked to him through instruments not clearly identified, from one floor of the shop to another. Drawbaugh sang to him through the instruments, "Old Folks at Home;" witness distinctly understanding both the tune and the words. Understood also other words which he does not now remember. Could distinguish the voice of the speaker. Drawbaugh at the time explained the principle of the talking machine to witness, and told him that he thought it would take the place of telegraphing, and that "he thought he could make it that he could talk through it to Harrisburg." Witness further testifies to the continuous work on Drawbaugh's talking machine from the date of that visit up to the date of his deposition.

HIERONYMOUS GEISTWEIT *(D. Vol. 1, p. 457)*:

Age, fifty-five; New Cumberland; engineer. Heard Drawbaugh talk through "B" and "F," in July, 1870 and 1871. Witness testifies that his visit to Drawbaugh's shop was made in 1870 for the purpose of procuring a ratchet-drill to use in making some repairs on a mill in New Cumberland, where he was then employed. Complainants' witness, Henry R. Musser, by his book entries, fixes the time when these rapairs were made as a year later — 1871. *(See Complts. Vol. 1, p. 372, Ans. 26, et seq.)* Witness listened at "B." Drawbaugh talked into "F," the instruments being in different parts of the building and being connected by small wires and wrapped with colored threads. Drawbaugh spoke some few words through the talking machine, and "then holloed out whether" witness heard them. Witness replied that he did quite "plain and distinct," and now testifies that that was the fact.

GEORGE FREE:

(*D. Vol. I, p. 484*): Age, 41; white. Hill, Cumberland County. Cattle dealer. Was at Drawbaugh's shop on or about June 21st, 1875, during haymaking of that year, with John A. Eyster (*see Eyster, D. Vol. 1, p. 490*), and heard Drawbaugh talking through the talking machines. Listened at "A" in the cellar while Drawbaugh talked from two floors above. Heard and understood distinctly. Remembers that Drawbaugh sang Yankee Doodle, and spoke other words, and asked questions through the machines. Witness understood what was said and plainly distinguished the voice as that of Drawbaugh. "A" was connected by two wires with the transmitting instrument, which was also connected by two wires with a battery. The testimony of this witness is also valuable as showing the continuous work of Drawbaugh on the talking machine, and his effort to improve it so as to make it talk up distinctly into the room so as to be heard at a distance.

DANIEL FETTROW:

(*D. Vol. 1, p. 347.*) Age, 51; residence, Eberly's Mills; blacksmith; did smithing for the axle company, composed of Baer, Kline, Grove and Moore, the first of which appeared by his book entries to have been done March 26, 1875, (see also Defendant's Exhibits, p.——) his account extending to September, 1876. The co-partnership known as the Axle Company was formed December 23, 1874, (*Moore, D. Vol. 1, p. 416, Ans. 3*), and was dissolved February 29, 1876. (*Id., Ans. 4.*) The business, however, being continued on a reduced scale, first by Moore and Grove, and subsequently by Moore alone for a short time longer, the last axles, with the exception of a few for exhibition at the Centennial, being made in April, 1876. The machinery of the company was put into the shop known throughout this case as Drawbaugh's shop, during the latter part of March, 1875. (*Id., pp. 616-617, Ansrs. 15, 16.*)

The testimony of the witness Fettrow is so striking, and in many respects important, that a portion of it is here given at length. He says:

Q. 16—State how he come to show you the talking machines the first time you saw them?

A.—The time that Baer was starting this axle machinery, Drawbaugh was rather counted as the head man of getting up the machinery; that is, putting up the shafts, and Drawbaugh came to me and told me to come down to the shop, to show me to make some levers, and I went down. After he had showed me how they were to be made, and I was just in the act of leaving the shop, he said to me, "Oh, Daniel! see here," and he went on ahead, around in another apartment of the shop; then he showed me this machine, which was then called the talking machine amongst us at home there. Then he showed me how to hold it to my mouth and to my ear, and then he went around into another room, and then he spelled Harrisburg; after he was done with that he sang notes. Then I said into this machine, "All right;" then he came back to me.

Q. 17—Did you distinctly hear and understand him when he was spelling and singing into the machine?

A.—Yes, sir.

Q. 17½—When he came back to you, did he say whether he heard you, when you said, "All right" into the machine?

A.—Yes, sir; he did.

Q. 18—Please look at the machines now shown you, marked "A," "B," "C," "D," "E," "F," "G," "H," "I," "J," "K," "L," "M," "N," "O," and see if you find the machines by which you and Mr. Drawbaugh talked to each other at that time, as you have testified?

A.—Figures were not mentioned at that time, but there was a curl on like that (taking up "D"). I would not just positively say that is the one, but it was just like that. Now, here is one (taking up "E"), that when you take the lid off is just the same way, so that I could not positively say.

Q. 19—Do you remember whether the instrument Mr.

Drawbaugh talked into was like the one you listened at, or did you see the instrument he talked into?

A.—No, sir; I did not see that one.

Q. 20—I understand you that you used the same instrument to listen at and to speak into. Am I correct?

A.—Yes, sir.

Q. 21—How did the size of that instrument compare with the size of this instrument "D"?

A.—As near as I can tell, it was the same size. It had a mouth-piece the same as that.

Q. 22—State what conversation you and Mr. Drawbaugh had about the talking machine at that time.

A.—After he had talked to me through the machine, he came back to where I was, and he said that this would go ahead of telegraphing. He said then that if I would want to telegraph to anybody, I would have to pay so much a word, and with this machine (meaning the speaking machine, as we called it then), I could, for five, six, eight or ten cents, speak myself to the man or person that I would want to speak to myself, and it would be cheaper than telegraphing.

Q. 23—Was anything said at that time about how far you could speak with this machine?

A.—Yes, sir; he said I could speak ten, fifteen, or twenty miles, or even to California, if there was a wire extended.

Q. 24—Was anything said at that time about patenting the invention? If so, what?

A.—Yes, sir; I asked him whether he had a patent, and he said not. He said he had not the money, but he said he had talked to a couple of men to go in with him and get it patented."

Although this appears to have been the first time the witness ever saw a talking machine, he had known of it, through report, in the neighborhood before, and had heard people call it "tom-foolery," (Ansrs. 26–27), at about the same time witness saw instruments "B," "F," "I" and "A," and subsequently, from time to time, other talking machines.

The testimony of this witness is further very important, showing the poverty of Drawbaugh, and his continuous work on the talking machine.

DAVID STEPHENSON, JR.

(*Add. proofs, p. 141*). Age, fifty; Mechanicsburg; machinist. In the argument at New York complainant's counsel laid great stress on the fact that this witness was not called to testify in this case, inasmuch as according to the statement there made, that if there had been a telephone at Drawbaugh's shop witness must have known of it. When further testimony came to be taken in the Overland case, Stephenson was called, and the reason why he was not produced in the People's case was shown to be because he had difficulty in fixing dates. He had, however, informed John C. Comfort, the confidential agent of complainant's counsel, long prior to the New York argument, that he had knowledge of the subject, but could not fix dates positively. The bad faith of the comments (*given at large Add. proofs, p. 142*) made by complainant's counsel upon the absence of his testimony, is therefore apparent.

He testifies that his first knowledge of Drawbaugh's talking machine was when the latter still lived and had his shop in the old house behind the grist-mill. (He moved out of it into a house which he purchased upon the hill, in the spring of 1868 (*D. Drawbaugh, D. Vol. 3, p 842*).

and moved his shop down to the clover mill at the creek some time earlier. (*Id. 750, 873.*)

Drawbaugh then and there showed it to him and talked to him through it, Drawbaugh speaking in one room and witness listening in another, and the instruments being connected by wires—more than one wire—which ran zigzag from post to post along the porch, for the purpose of increasing the length of the circuit. Witness heard the sound faintly through the instruments, and seems to have understood words, although he cannot remember any of them. He also positively established the fact of having been at Drawbaugh's shop in the fall of 1874.

This witness also positively establishes the fact of being at Drawbaugh's shop with his daughters, Alice and Florence, in the chestnut season, prior to September 1, 1875; that is, not later than the month of November, 1874. The dates are fixed absolutely by his rent receipts and vouchers, showing where the witness was living, to wit, at the corner of Third and Chestnut streets, Harrisburg, at the time of this latter visit. While at Drawbaugh's shop on this occasion, the telephones were exhibited to him and his daughters, and Mr. Drawbaugh and the witness talked to each other through them from first story of the clover-mill shop to the basement, and heard and understood perfectly well the transmission of speech through them. Mr. Stevenson's daughters, Alice and Florence, corroborate the testimony of their father of this latter visit in every particular, and render it absolutely unanswerable. They fix the time of the visit as being in the chestnut season, while they were living at the house corner of Third and Chestnut streets, Harrisburg, by a circumstance which is absolutely conclusive, to wit: that on their return home that evening, they were conveyed across the railroad bridge over the

Susquehanna River upon a shifting engine, which the engineer stopped at the corner of Chestnut street, the block in which their house is situated, in order to let them off at the point nearest their home; this, they say, being the only time they rode on a railroad locomotive.

ORLANDO B. KAHNEY (*D. S. Reb., p. 224*):

One of complainants' negative witnesses (*see Complainants' Vol. II, p. 990*), who had previously testified that although he lived at or near Eberly's Mills from 1871 to 1879, he had no knowledge of Drawbaugh's talking machine until the fall of 1876, testifies that he was at Drawbaugh's shop in July, 1875, before the oats harvest of that year, and then and there saw and heard Drawbaugh talk through his talking machine. Understood what was said through the instruments. He was accompanied to the shop on this occasion by Milton Basehore, who was working with him at the time for Wilson P. Walters, and they went there for the purpose of grinding scythes to be used for cutting oats. It appears by the books of Walters (*D. S. Reb., p. 121*) that Orlando Kahney never worked for him after September 11, 1875. Witness is corroborated by Basehore (*D. S. Reb., p. 116*), who testifies with regard to the visit, fixing its date, and to the fact of seeing Kahney in the act of listening at the talking machine.

A striking circumstance may be here mentioned that the witness Kahney, after having testified for complainant, recalled the fact of this visit and his seeing talking machines then and there, and endeavored to induce complainants to allow him to come back upon the stand and correct his former testimony, but without success.

DANIEL RUPP (*D. Vol. 1, p. 427*):

Age 48; Spring Garden, Lancaster County; coachmaker. Drawbaugh talked through machine to witness in 1874. (Date fixed by building of house.) Witness listened at "A" and understood what Drawbaugh said. Repeated the language which he heard through the machine to Drawbaugh, who informed him that it was correct. He remembers that the names of the cities of Pennsylvania were spoken through the machine Instruments were connected by copper wire covered with silk or cotton, and Drawbaugh told him that his invention would take the place of telegraphing.

DR. GEORGE W. BOWMAN (*Add. Proofs, p. 173; recalled, p. 179*):

Age, forty-two; Mechanicsburg; dentist. Testifies that he was at Drawbaugh's shop prior to May, 1871, and saw and heard Drawbaugh talk through the talking machine. The circumstances which he relates and which are corroborated by the testimony of his wife, Mrs. Maggie E. Bowman (*Add. Proofs, p. 177*), fixed the date of the visit beyond all question. He testifies that Drawbaugh talked on the third floor, if his memory serves him right, and that he, witness, listened down in the basement. The instruments used are not identified, but witness remembers that they were connected by a wire of wires that hung loose, and he also remembers some of the words which he heard through them. His wife was at Drawbaugh's shop with him on that occasion, but remained in the buggy, and did not see the talking machines. She, however, corroborates him by testifying that when he came out of the shop he told her what had occurred, and she fixes the date with great positiveness that the visit was before her mother's death, which occurred March 14, 1871; Dr. Bowman and his wife having gone to Eberly's Mills at the persuasion of Mrs. Bowman's mother to attend a baptism.

HENRY B. MUSSER:

(D. Vol. 1, p. 315): Age 41; residence, Camp Hill; farmer. Went to Drawbaugh's shop June 27, 1874. (Date fixed by book entry, (*Ans. 8*), to have a reaper fixed, and whilst there Drawbaugh showed and talked to him through " B " and " F." " B " used as receiver. (Ans. 86.) Heard and understood. Drawbaugh then explained to him the principle of the talking machine, telling him it was operated by electricity, and spoke to him of high and low conductors. Ans. 19: " He showed me " there something that he had — low conductor and high " conductor; and two things flattened together, using his " hands with the palms together, to show me (thus), and " called it a low conductor; and the one raised, a high con- " ductor. I understood it in that way; he explained it in " that way to me, but I could not understand it." (The witness, in illustration, in the course of his answer, presses the palms of his hands together.)

Witness again visited Drawbaugh's shop June 28, 1876 (see Moore, D. Vol. 1, p. 623, Ans. 33), to have some repairs made to his mowing machine. He then saw " D " and " E," and Drawbaugh talked through them to him. Witness heard and understood what was said through the instrument.

WILLIAM SENSEMAN (*D. vol. 1, p. 640*):

Age, 43; residence, Boiling Springs, Cumberland County. Dealer in horses. Lived at Eberly's Mills from April, 1872, to April, 1873. Has never been at Drawbaugh's shop since the latter date. During the period mentioned, Drawbaugh showed him talking machines, and talked through them to him from the second floor of the shop to the basement. Wiiness could hear and understand some of the words. Does not name the instrument used for the talking, but identifies "B," "F," "C" and "I," as seen by him at Drawbaugh's shop.

JAMES BROOKS (*D. Vol. 1, p. 41*):

Age, sixty-eight; residence, Shiremanstown; present postmaster; millwright. Was at Drawbaugh's shop between December 16, 1873, and March 31, 1874 (which dates he fixes by certain work he did upon the grist mill at Eberly's Mills), and then and there heard conversation through "B" and "F," between the third floor and the cellar in the shop. Instruments were connected by two wrapped wires. Heard and understood distinctly and recognized the peculiarity of the voice of the speaker. Drawbaugh told him at the time that the machines were operated by electricity.

JACOB B. FRY.

(*D. Vol. 1, p. 98.*) Age, twenty; residence, Shiremanstown; occupation, laborer; lived at Eberly's Mills from last of March or April 1, 1873. (*See, also, Jeremiah Fry, Id. p. 143.*) First saw talking machines at Drawbaugh's shop, in May or June, after moving there. Identifies "D" and "E," remembering particularly the curled magnets on them. Heard Daniel Drawbaugh talk through the machines at that time, although he cannot state positively that "D" and "E" were the ones used. Heard Drawbaugh at that time say through the speaking machines that "Harrisburg was situated on the banks of the Susquehanna River." Those words he heard plainly and distinctly.

He also testifies to seeing other talking machines there at various times from 1875 to 1879, and to the fact that

Drawbaugh was at work, making improvements, from time to time during that period.

IRA D. KAHNEY.

(*D. Vol. 1, p. 201*): Age, 32; residence, Camp Hill; occupation, boss in a stone quarry. "Between 1871 and 1872" heard Daniel Drawbaugh talk through "B" and "F" from the upper part of the shop to the lower—Drawbaugh talking into "F," and witness listening at "B." Heard and understood distinctly. "Between 1873 and 1874," heard Drawbaugh again talk through talking machines from upper to lower part of shop, witness listening at "A." Heard and understood what was said, and could tell that it was Daniel Drawbaugh speaking. Witness also identifies other instruments seen at subsequent times, and testifies to Drawbaugh's desire to patent his invention, and to circumstances showing its electrical character.

WASHINGTON SUTTON (D. vol. 2, p. 1,103): Age, sixty-one; Lewisbury, York County; blacksmith by trade. Was at Drawbaugh's shop in August, 1873, which date he fixes by the date of a sale note (Ansrs. 3 and 4). At this visit he talked machines, and heard Drawbaugh talk through them. Is corroborated as to his date and statement by Rankin B. Sutton (D. vol. 2, p. 1,108).

JESSE EICHOLTZ.

(*D. S. Reb., p. 152; recalled, p. 160*). Age, 47; residence, Grantville, Dauphin County. Present occupation, carpenter. Formerly miller. Formerly lived at Oyster's Mill, on the Conodoguinet Creek, in Cumberland County, three miles or more from Eberly's Mills. First saw talking machines in summer of 1871, when he visited Drawbaugh's shop for the purpose of seeing them, having previously been told about them by Drawbaugh and invited by him to go and see them. Drawbaugh then talked through them to witness, who heard and understood distinctly what was said. Was again at Drawbaugh's shop November 6th, 1873 (which date he fixes by book accounts), in company with his wife. Drawbaugh then showed them his talking machine, and talked through it to them from the upper floor of the shop to the basement. Witness understood plainly what was said and remembers some of the words spoken. He testifies that when Drawbaugh first spoke through the machines to them on this occasion the shop was quiet; but that in order to illustrate further the capabilities of his invention, he started the machinery of the shop, and they still heard what he said through the machines. Witness does not positively identify the machine at which he listened and talked on the occasion of the second visit, but thinks he saw both "C" and "I" there at that time. He listened and talked at the same machine. He says: "(Drawbaugh) said he "would start the wheels now and go up and talk to us "again, and that we should listen and would still hear him. "I remember one word yet that he spoke to me. He "asked us, just as he was going to quit, 'Do you understand "me,' and I said, 'Yes;' then he came down and said, 'I "understood you, and you understood me.' I don't "remember what else he talked to us, but I mind that."

His date of November 6, 1873, has been attacked by complainants, because he testified that John Tehl rode along with him on "that day from Tehl's mill, where he was milling at that time," it having been shown by complainants (*Etter, Complts. Vol. 3, p. 274*) that Tehl had ceased living there some time before that date. But the statement of the witness that Tehl was milling there at that time is of no special consequence and cannot fairly be used to shake his date, a reasonable explanation being that Tehl happened to be at the mill on that day and rode with witness, who, residing at some distance from there, and knowing of Tehl's former connection with the mill, may not have been informed of any change; or if he knew it at the time, may have forgotten it when testifying. Witness is corroborated by his wife, Melinda M. Eicholtz (*D. S. Reb. p. 158*), in every particular as to his visit of November 6, 1873, and what took place then. She also testifies that she was never at Drawbaugh's shop, except on this occasion.

ABRAHAM MAY (*D. S. Reb., p. 1,028*).

Age, forty-seven. Residence, Centre Township, Perry County, Pennsylvania. Now farmer; formerly carpenter and builder. Worked at repairs on house of Daniel Hart, at Eberly's Mills, from August 22, to September 18, 1870 (dates fixed by account book produced), and during the progress of this work had occasion to go to Drawbaugh's shop to have a boring machine repaired. Then and there saw and heard Drawbaugh talk through his talking machine from up stairs to the basement. Heard and understood the words which were spoken.

BENJAMIN R. GOODYEAR.

(*D. S. Reb., p. 1,011.*) Age, forty-seven; Carlisle; lawyer. Formerly deputy sheriff. Whilst deputy sheriff in 1871, he made a levy under a writ of execution against George W. Kissenger, and on the 4th of December, 1871, held an appraisement of goods under the exemption laws. Upon that occasion he went to Drawbaugh's shop to summon John B. Drawbaugh as an appraiser, and then and there saw and heard Daniel Drawbaugh talk through the talking machine from floor to floor. Understood distinctly. The date is fixed by the certified copy of the record, which is offered in evidence, with depositions of this witness. So far as he can recollect, witness has never been at Drawbaugh's shop since.

WILLIAM H. MARTIN (*D. S. Reb. p. 827*): Age, thirty-five; near Pittsburgh, Pennsylvania; carpenter; resided in Cumberland County until April 1, 1876; went to Milltown or Eberly's Mills, in company with John Keefauver, to get George Hosler to make him a pair of boots whilst Hosler was living there. Hosler lived at Eberly's Mills only from March 5, 1872, to March 25, 1873. (*D. S. Reb., p. 368.*) Witness and Keefauver then and there talked through Drawbaugh's talking machine from the basement to the attic, using the same machine for both talking and listening. Understood what was spoken, and carried on conversation through the machines. Witness had, however, heard of Drawbaugh's talking machine long previous to this, to wit: 1869, 1870.

JOHN F. KEEFAUVER (*D. S. Reb., p. 837*):

Age, forty-one; Harrisburg; grocer. Corroborates Martin in every particular as to his visit to Drawbaugh's shop while Hosler lived at Eberly's Mills, and seeing and talking through the talking machines. Talked both ways and carried on conversation through them.

This witness also, on another occasion, talked through the talking machines from cellar to attic in Drawbaugh's shop when he was there in company with Jacob M. Sadler, now dead. Talked both ways and understood, and was able to carry on a conversation through the machines. The latest possible date of this visit is fixed by the fact that witness on this occasion went to Eberly's Mills to see George B. Heck, who died in July, 1873. (*See John B. Heck, D. S. Reb., p. 893, Ans. 10.*)

JEREMIAH KOHLER.

(D. Vol. 1, p. 543.) Age, 45; Bridgeport, Cumberland County. Miller. Lived at Eberly's Mills April, 1873, to April, 1874. (See, also, W. N. Miller, Id. p. 643, Ans. 5–10.) During that time Drawbaugh talked with him several times from floor to floor, through machines which are not identified, but which were connected with wires and a battery, and which witness understood were operated by electricity. Witness heard and understood what was spoken through the machines. He also identifies "B," "C," and "F" as machines seen by him at Drawbaugh's shop, during the period mentioned, and testified that he saw Drawbaugh making "A."

JOHN J. ZACHARIAS (*D. vol. I, p. 47*):

Age, forty-one; residence, Siddonsburg, York County, Pa.; miller. Testifies that he was at Drawbaugh's shop to get a mill-tram, between 1870 and 1874, the date of his visit, however, being fixed by Joseph B. Stretch (*D. vol. 1, p. 60*), by book account made at the time as in July, 1869, and never got but one tram. Saw "B" and "F," and heard Drawbaugh talk through them. Heard and understood what was said, and understood Drawbaugh's voice distinctly and recognized it. Sound was as loud as though a speaker was speaking in an undertone, and not so harsh as in ordinary conversation. Drawbaugh told him, at that time, that he could talk for miles and that his invention would eventually take the place of telegraphs. The machines were connected by wrapped wire.

GEORGE FRESSE (D. vol. 1, p. 132):

Age, sixty-two; residence, Shiremanstown; tailor; formerly burgess of Shiremanstown. Was at Drawbaugh's shop September 17, 1869. (Date fixed by book entry of Henry Yetter, Id. 135–6), to collect a small bill which Drawbaugh owed him for tailoring. At that time Drawbaugh showed him and talked to him through his talking machine. Witness heard distinctly. Identifies "B."

HENRY BAYLOR *(D. Vol. 1, p. 150)*:

Age, sixty-two; residence, York, Pa.; retired merchant. Was engaged in the lumber business from April, 1873, until the last of 1876 or beginning of 1877. First visited Drawbaugh's shop in June, 1873. This date is corroborated by the fact which witness testifies (Ans. 28) that he was after the faucet interest, and that he ascertained that it had been sold to a Mechanicsburg party after his visit to Drawbaugh's shop on that business. The faucet interest was sold to the Haucks, of Mechanicsburg, July 1, 1873, and possession given July 15, 1873. *(See Gorgas Vol. 1, p. 653, Ans. 30; and D. A. Hauck, Complts. Vol. 1, p. 789, Ans. 16–17.)* Witness testifies that Drawbaugh showed him his talking machine and talked through it to him at this time. Although witness cannot recall any words that were transmitted, he testifies that he could "plainly distinguish his" (Drawbaugh's) "voice," and that the latter talked to him in different tones of voice, witness hearing him even when "a very low voice" was used. Witness was much impressed with the invention, and upon receiving an offer from Drawbaugh of a half interest in it, if he would advance means to procure a patent upon it, seriously considered the matter, and "was almost induced to risk a few hundred dollars, and would have done so," had it not been for the fact that he was about that time greatly worried about some of his business affairs.

SAMUEL NICHOLS (*D. Vol. 1, p. 227*):

Age, 51; residence, White Hill, Cumberland County, Pennsylvania; civil engineer; heard Drawbaugh talk through "B" and "F," in the summer of 1870; Drawbaugh talking into "F," and witness listening at "B." Witness distinguished Drawbaugh's voice very plainly and understood all that was spoken through the machines. "B" and "F" were connected by two wires and located in different rooms.

This witness testified, that upon the occasion referred to, Samuel Bruce, his son-in-law, was along with him, and that there were others present whom he does not recollect. Complainants attempt to attack his date by showing that Bruce did not become his son-in-law until June 10, 1876 (see Spees, Complts. Vol. 2, p. 925). But it will be observed that witness does not testify that Bruce was his son-in-law at the time of the visit, but probably speaks of him in that relation, merely, for the purpose of identification. A weak attempt was also made by complainants to show by the testimony of witness' son, Edward Nichols (Complts. Vol. 2, p. 858), that witness could not have been well acquainted with Bruce as early as 1870, but in this they completely failed (see Edward Nichols, *Id.* p. 881, Cross-Ansrs. 256, 257).

JOHN SCHERICH:

(*D. Vol. 1, p. 176*): Age, 69; residence, Mechanicsburg; insurance agent; lived at Camp Hill, about a mile and a half from Eberly's Mills, from April 1, 1873, until April 1, 1875. Was at Drawbaugh's shop about four years prior to moving to Camp Hill, and saw "B" and "F," through which Drawbaugh talked to him from the basement to the third story of the shop. Witness listened at "B" and heard what Drawbaugh said. Whilst living at Camp Hill, and in the fall of the year, witness went to Drawbaugh's shop to make cider, (cider-mill sold by Drawbaugh to Hake in the summer or fall of 1875. See Drawbaugh, D. Vol. 2, p. 888, Ans. 759, and was in use at Hake's Mill in 1876. See Emminger, Complts. Vol. 2, p. 935.) That it was in use at Drawbaugh's shop as early as 1874. (See John Kahney, Complts. Vol. 3, p. 2,054, Ans. 180; p. 2,041, Ans. 62), and this was the last time witness was in Drawbaugh's shop. He then and there saw instrument "A," and heard Drawbaugh talk through the talking machines, witness listening at "A" on the third floor, and Drawbaugh talking in the basement in an instrument which resembled "I."

WILSON G. FOX, late Chief of Police of Harrisburg, Pa. (*D. S. Reb. 342-7*), saw the talking machine in Drawbaugh's shop in 1867 or 1868, when the old Faucet Company was in operation there. Prior to March, 1871, witness was employed in the carding room of the Harrisburg Cotton Mill, and Drawbaugh came there to get cotton to wrap his wire, which he intended to use for the talking machine.

JACOB BARBER (*Id. 371-7*) was a candidate for the office of County Commissioner of Cumberland County in the summer of 1873, and, in connection with that political campaign, had occasion to go to Drawbaugh's shop shortly after the death of Geo. B. Heck. While at Drawbaugh's shop saw the talking machine there. *Was never at the shop after July or the beginning of August, 1873.*

ABRAHAM MARQUART, Justice of the Peace and one of the most prominent citizens of Newville, Cumberland Co., formerly an insurance agent, gives testimony of the most conclusive character as to the existence of Drawbaugh's telephones (*Exhibits "D" and "E"*) as early as March, 1875. The witness was never at Drawbaugh's shop after that time, and the date is absolutely fixed by a business transaction which took him there and of which he made a record in his insurance book at the time. (*Add. proofs, p. 113*).

WILSON H. STRICKLER, (*Add. proofs, p. 233*), gives testimony of the most singularly conclusive character. He is a stock-raiser from Ford County, Kansas, and arrived in Pennsylvania on the 12th day of March, 1885, before he gave his testimony. He had formerly lived at Harrisburg, Pa., and he testified that he never was in Milltown (Eberly's Mill's), Cumberland Co., Pa., but once, and that he then made the acquaintance of Daniel Drawbaugh; that he had never seen him since the day he first made his acquintance, nor since he arrived from Kansas to give his testimony. He relates that he visited a friend near Milltown, and told him of a process he was then preparing to insulate telegraph wires with mica, and that he was desirous of ascertaining how insulated wire was covered with webbing, so as to know whether the ordinary process of covering with webbing would be a suitable means to enable him to insulate with mica. His friend took him to Daniel Drawbaugh. He had not then patented his conception, but was preparing to do so, and afterwards applied for it, and produced a patent bearing date April 20, 1875. The specifications and drawings were produced, showing that the specifications were filed August 22, 1874. He swears positively that he had not filed an application, and was not prepared to file an application at the time he visited Drawbaugh, and he names Mr. Geo. Free (a witness here, *supra*), as the friend who took him to Drawbaugh and introduced him on a Sunday morning; that Drawbaugh then and there showed him the mode practiced by him in insulating by wrapping it with insulated material, and showed him the several machines that he (Drawbaugh) had for covering wire. He then goes on to describe the talking machine which Drawbaugh showed him and explained how electricity operated it. He showed him the large horse-shoe magnet which he then was using; remembers the machines, and says that he understood and talked through them. He says that Drawbaugh talked, and that he, the witness, answered back over the wire; that Drawbaugh was not in the same room, but in another room. He remembers distinctly the "two spools" which were coiled with fine insulated wire (electro-magnet), and that these two spools were at the end of the horse-shoe magnet.

This witness then went *with the Examiner* to the room where the exhibits were, looked at the exhibits there in charge of the Examiner; looked at all the instruments in this case, and selected the instrument known as "C," and returned to the examining room with it.

This witness had formerly been the agent for the Society for the Prevention of Cruelty to Animals at Harrisburg; also had been Yardmaster at the Harrisburg Stock Yards.

William W. Snyder (*D. S. Reb., pp. 1,066–82*) was at Drawbaugh's shop Wednesday, February 5, 1873, and saw the talking machines. Witness fixes the date by an entry in his diary.

ABRAHAM DITTLOW (*D. S. Reb., p. 376*):

This was one of complainants' negative witnesses (*See Complts. vol. 2, p. 967*), who, under the skillful manipulation of his memory by complainant's agents, knew nothing of the talking machine until the spring of 1876, but he, himself, upon reflection, was able to remember having seen and heard talking through a talking machine in 1874, which date he fixes by the circumstance of his preparing a trapping kit at Drawbaugh's shop at that time. Witness listened whilst Drawbaugh talked from floor to floor, and understood "well enough" what was said through the machine, although at the time he, in order to plague Drawbaugh, told him that he did not understand. Alexander Hillner (*D. S. Reb., p. 512*) corroborates witness, testifying that witness told him about circumstances above related in the spring of 1876, in Indiana, and C. B. Clifford (*D. S. Reb., p. 515*) testifies to the same effect.

Without continuing an extended analysis we refer briefly, in addition to the foregoing, and in addition to the witnesses discussed and quoted under A DISCUSSION OF THE HISTORY, CONCEPTION AND INVENTION, CAPTION V, to the following equally strong and positive testimony:

Henry Yetter, keeper of the tavern at Milltown and butcher. (*D. I. 138.*)

David B. Carl, butcher and farmer. (*Id. 157–65.*)

Jacob S. Schopp, farmer and stock-grower. (*Id. 389–92.*)

Henry Bonholtzer, blacksmith. (*Id. 384–7.*)

Harmon K. Drawbaugh, teacher, of Harrisburg. (*Id., p. 550.*)

John B. Drawbaugh, machinist, and brother of Daniel. (*Id., p. 575.*)

Geo. W. Drawbaugh, son of John B., machinist (*Id. p. 597*).

John H. Stephen (*Id. p. 597*): Farmer. His dates are corroborated by Henry Ostot (*D. S. Reb., p. 361*), and fixes as the time 1870–71. Ostot was never in the shop after 1873, and was there with Stephen.

Peter Z. Zimmerman, wheelwright (*Id. p. 414*).

Elias Z. Good, miller and fence-maker. Saw the machines in 1872, before he moved away from Milltown on April 1, 1872 (*Id. p. 198*).

Jacob Hawn, blacksmith, fixes date as prior to May 27, 1872, when he moved away from Milltown. (*Id. p. 266*.)

John C. Smith, machinist (*Id. p. 334*).

Henry F. Drawbaugh, superintendent of the lumber yards at Newville (*Id. p. 396*).

Jacob E. Shettel, formerly member of Clock Company. Commented on as man of means and character by complainants. (Id. p. 206.)

Rufus K. Shireman, painter. (Id. p. 259.)

Dr. John W. Moffit, Harrisburg. (Id. p. 494.)

Henry N. Shoop, carpenter. (Id. p. 255.)

Jacob B. Smith, laborer. Saw the machines on his wedding trip in 1871. (Id. p. 165.)

Daniel C. Jones, clerk in the hat business at Harrisburg. Had not been at Drawbaugh's shop since 1871; saw the machines then. (Id. p. 503.)

Daniel B. Smyser, farmer. Saw the machines before his wife died; she died January 24, 1874. (Id. p. 607.)

Urias R. Nichols. (Id. p. 89.)

Jonathan Balsley, blacksmith. Fixes the date by the death of his wife. (Id. p. 107.)

Daniel B. Condry, miller. (Id. p. 138.)

William Epply, farmer. (Id. p. 280.)

John A. Oyster, farmer. (Id. p. 490.)

John F. Rupp, florist. (Id. p. 311.)

REFERRING TO VOL. II, DEFENDANTS' EVIDENCE.

Henry Herr, farmer. (D. Vol. 2, p. 667.)

N. N. Hubler, foreman builder at the Harrisburg Car Works. Was teaching school for four months, once a week, in the fall of 1873, at Milltown. (Id. 691.)

John Wolf; 75 years of age; retired farmer. (Id. p. 673.)

John H. Smith; cordwainer. Was with Dr. Updegraff. (Id. p. 1,093.)

Thomas Updegrove. With Updegraff in the spring of 1874. (Id. p. 1,098.)

REFERRING TO SUR-REBUTTING EVIDENCE.

George Hosler, shoemaker and Supervisor of the Roads. (D. S. Reb. p. 367.)

Jacob R. Vanansdale, steam thresher and agent for Hawk & Comstock's machinery, testifies to having seen "F" and "B," February 3, 1875, at the shop. Never was there after that. Fixes time by book entry and explosion of Wilson's store. (Id. p. 788.)

Jacob F. Emsinger. Corroborates Vanansdale, who was with him at the time. Railroad man on the Northern Central Railway. (Id. p. 808.)

Andrew and Mary Evans. Saw machines in December, 1875. (Id. pp. 1-61.)

CHARLES F. STEINBERGER:

Miller; now living in Perry County. Never was in Drawbaugh's shop since he moved away in 1871, in October. He identifies Exhibits "F," "B," "C" and "I" as having been seen by him in the shop in 1871. He never again saw the instruments " C " and " I " until the day when he gave his deposition, and " C " until he was actually on the stand. Just before he went on the stand defendant's counsel showed him some of Drawbaugh's old talking machines, but not " I." The witness told him there was one more and asked to see it, and described it so clearly that Exhibit " I," from his description, was brought. (*D. I., p. 344.*)

Jacob S. Shoop. (*Id. p. 387–92.*)

HENRY OSTOT: Was never in Drawbaugh's shop but twice; first time in 1870 or 1871, and the last time being on the day of the public sale of the effects of Geo. B. Heck, deceased. That sale is fixed by the papers at September 13, 1873 (John B. Heck, D. S. Reb., 892–3). Ostot saw the talking machines on his first visit to Drawbaugh's shop, but does not remember seeing any on his last visit. He identifies " C." (Id. p. 360–4.)

MRS. EICKHOLTZ: Was with her husband, Jesse Eickholtz, at the shop, November 6, 1873; never at the shop since. Corroborates her husband's account of the visit and of talking through the machines, in every particular. She had also heard they were Drawbaugh's talking machines before her husband went down to see it in 1870 and 1871 (Id. p. 151–8–60).

GEORGE B. EYSTER, sheriff of Cumberland County, corroborates Eickholtz' testimony. He was Eickholtz' partner and was told of the visit to Drawbaugh's shop at the time. (Id. p. 890–1).

E. B. HOFFMAN. (Recalled, Id., p. 660.) Identifies the time as of the time of the great flood. Complainants made an effort to break Hoffman's date of August, 1873, but utterly failed. (See Appendix D of closing brief, and D. vol. I, 481–4).

GEORGE L. HALE. (Id. p. 472.) Tinner and coppersmith. (Id. p. 472-7). Recalled, p. 694. Describes magnet and its position in "C" at the time of his visit in the fall of 1873. Describes the wires as covered with green wound around spools (electro-magnet), and that spools were arranged between the diaphragm and the permanent magnet.

RANKIN B. SUTTON *(D. Vol. II, p. 1,108-9):* Testifies that when Washington Sutton (*supra*) returned home from Drawbaugh's shop, in 1873, he told him of the talking machine, and says: "I heard Drawbaugh speak of them." The date is fixed by the testimony as immediately after the sale of the machinery to the Hecks, in July, 1873, and confirms the date of August, 1873, as fixed by the recollection of both the Suttons. Washington Sutton was never at Drawbaugh's shop after that. *(W. Sutton, Ans. 1.)*

WILLIAM F. LENIG: Machinist, at the Harrisburg Car Works. Saw the machines with Hubler when Hubler was teaching school at Milltown. Remembers the horseshoe magnet upon it. *(D. 2, pp. 698-9.)*

DAVID SPANGLER: Farmer and marketman. Lived on the Studebaker farm about March, 1875; was once at Drawbaugh's shop in 1874. Has since lived at Shiremanstown. *(S. Reb., pp. 454, 462.)*

THOMAS DRAPER, a prominent business man of Dover, Delaware, testifies, that he was at Drawbaugh's shop in 1874, for the purpose of ordering an hydraulic ram for his tenant Kissinger. He then saw and talked through instrument "C" and "I;" distinctly understood and heard what was said. Defendants didn't know of his information about talking machines until after the complainants had interviewed him and first got the facts. His testimony is before referred to under another head, and it is as to this witness that the dates were attacked in the ram controversy. (See Appendix " A " at the end of closing brief, and D. II, p. 1,123–35.)

William H. Bates, blacksmith, from Mountjoy, Lancaster Co. (D. I, p. 419–26.)

John Weber, farmer, was in shop of Drawbaugh December, 1874. Never been there since January, 1875. (D. I, p. 244.)

Andrew Evans, house painter, fixes the date with absolute certainty by the loss of his leg and employment for Mr. Baer, as the fall of 1874. (D. I. p. 62.)

Henry M. Darr. (Id. p. 272–5.)

Mary A. Evans. (D. S. Reb. p. 61–74, 55–60).

Jeremiah Fry. Tobacco farming and merchant. (D. I. p. 143.) Identifies " A," " D," and " E" as of April 9, 1875. (D. I. p. 143.)

Elias Graybill. Saw " D" and " E" before December, 1875. (D. S. Reb. p. 184, 206.)

Daniel A. Hammacher. School teacher. Was at the Drawbaugh shop with his scholars on Feb. 1, 1876. (D. S. Reb. p. 289, 312.)

Augustus Kahney. Day laborer. (D. S. Reb. p. 254.)

Michael Konn. A laborer. (D. I. p. 129.)

Robert McCleaf. Miller. Never was in shop but once, nor since the blowing up of Wilson's store on Jan. 19, 1875. (D. S. Reb. p. 815.)

Jacob M. Peterman. Laborer on Pennsylvania R. R. (D. S. Reb. p. 471–6).

John F. Rupp: Was a pupil with D. A. Marquart on his visit to shop, February 1, 1876. (D. I. pp. 311, 314.)

John Simmons: Was at the shop with Jacob Evans in November, 1875, and saw the talking machines. (D. S. Reb. p. 427.)

John M. Waggoner: Operates an electro-galvanic battery for the cure of diseases, and runs a country store. (D. I. pp. 122–128.)

Joseph M. Wisler: Heater at Steel Works in Steeltown. (Id. pp. 392–396.)

George A. May. Laborer. Heard and understood through machine in March, 1875, while he was working for Jonathan Fry (D. S. Reb. p. 982).

John H. Stephen (D. I. p. 248): Farmer.

Margaret Jane Erb. Was with her brothers Andrew and Jacob Evans, and her sister and Jacob Evans' wife at the time referred to by Andrew Evans. Corroborates him and identifies "D" and "E" (Id. p. 47). Also, by Sarah E. Evans, of same, pp. 55, 60, and by Mary A. Evans, wife of Jacob, pp. 65, 74.

EPHRAIM R. HOLSINGER AND HIS PUBLICATION OF A CARD FOR DRAWBAUGH, NOT INCLUDING IN ITS LIST OF INVENTIONS THE TALKING MACHINE.

(D. vol. I, p. 360): Age, 38; Saxton, Bedford County, Pa. Newspaper man and job printer. Lived at Eberly's Mills from September 13th, 1873, to November 27, 1876, but was never there after he moved away, at the latter date. During this time he was much at Drawbaugh's shop, and assisted the latter a great deal in experimenting. He identifies a large number of instruments as having been seen by him at Drawbaugh's shop, to wit: "A," "B," "D," "E," "F," "I," and testifies that he helped to experiment with all of them. He thus describes some of their experiments:

Q. 26.—Did you and Mr. Drawbaugh ever operate the machines "B" and "F"?

A.—We did.

Q. 27.—What did you do with them?

A.—We connected them with wires through partitions and floors; spoke into one, listened at the other. We had them through the partition, and again through two floors into the basement.

Q. 28.—When you listened at one, and Mr. Drawbaugh talked into the other, did you hear and understand distinctly what he said through the machine?

A.—Yes; very distinctly. Could tell talking and music apart.

Q. 29.—Could you hear and understand the words that were spoken when he talked into the machine?

A.—Yes, sir; he would use such words which have familiar sounds, knowing them to be more hard to understand than those having contrast in sound.

Q. 30.—After you saw Mr. Drawbaugh making the machine "A," did you take part with him in experimenting with the machine and listening to see how the words came through it?

A.—I did.

Q. 31.—How well did that operate?

A.—Somewhat better than the first experiment in which I had acted a part.

Q. 32.—Did you see him make the machines "D" and "E"?

A.—I did.

Q. 33.—Did you talk with him through those two machines while you lived there?

A.—Yes, sir.

Q. 34.—To the best of your recollection, about what time was it when you and Mr. Drawbaugh first experimented with those two machines, " D " and " E "?

A.—About the middle of the summer, 1875.

Q. 35.—Did you and he, after you first saw those two machines, " D " and " E," experiment with them a good deal, or not much ?

A.—Very frequently.

Q. 36.—Did you hear and understand distinctly what was said through those machines ?

A.—We did; we could speak through this one (holding up " D ") and hear what the other one said with it also; and the same with " E."

* * * * * *

Q. 53— In any of your experiments with Mr. Drawbaugh at his shop, did one of you whisper through the machines, or make any other noises than talking and singing, to see how they would convey such sounds?

A.—We did. We whispered, we scratched on pieces of wood, with pieces of old file, we rubbed paper together between our fingers, and then would ask one another whether one could tell what the other one done, or how the noise was made. We asked this through the machines and otherwise. We would hold the paper, or whatever we used, by which the noise was made, to the mouth-piece of the machine.

Q. 54—And could you distinguish through the machine how any of those various noises were made?

A.—Most generally.

This witness was called by the Complainants (Comp. vol. II, p. 1,210), who proved by him that he published a card for Drawbaugh (Id. p. 1,213), before June, 1874, containing a partial list of inventions and not mentioning the telephone. This card figures in many places in complainant's brief, and seems to have taken up considerable space in the opinion of the court.

We say of it:

(1.) It was prepared by Holsinger, without Drawbaugh's supervision, and as a sort of return for Drawbaugh's aid to him in getting him assistance to start a new paper (Id. x. 2, 29, p. 1,219, Q. 5, p. 1,211). It bears internal evidence of inaccuracy in describing inventions of Drawbaugh's, notably in its description of the electric clock.

(2.) *It purports only to give a list of patented inventions.* It omits the stamp canceller, the siphon pump, the machine for wrapping wire, the weather indicator, the gas governor, the automatic boiler feed, all proven by complainants as before that time. It inaccurately gives as patented some things not patented; but Holsinger knew well that the *telephone* was not.

(3.) It purports to give a list of those things likely to bring money-earning business from the surrounding neighborhood, in practical and every-day tools among the people where the card was issued. The only electrical machine mentioned is referred to with a special emphasis on its *simplicity* and the absence of a battery, thus giving assurance of a practical machine for practical uses among the country people.

(4.) As a card issued to farmers, millmen and housewives in Milltown, the advertisement for sale of a double machine for telephoning would have been absurd.

(5.) It was early in 1874, and Drawbaugh had no telephone machines ready for sale, and the card purports to advertise only for sale to the class of people about there, and it omitted the gas governor and wire 'wrappers and the stamp canceller, for the same reason, *i. e.*, such people did not use them.

(6.) As Drawbaugh was then experimenting to make it "talk out," and had not patented it, but was negotiating to get financial aid in the enterprise, he would not care to advertise to patent pirates the matter of his greatest work, to no good purpose

(7.) Drawbaugh was said to be a fool and insane at the same time on account of his devotion to this invention; his labors had come to be unremunerative, and his object was, as shown by his moving to Mechanicsville, the next year, to get every-day work, and let the people know he was doing it without calling marked attention in that community to his "hobby," and the subject of adverse criticism, which was notorious among the people whose custom he sought by the card.

(8.) Holsinger talked through the, to him, perfect, because finished, machines "D" and "E" (not finished until February 1875) in the summer of 1875, a year after the card! and the "experiments," as he calls them, of 1874 were with the rude and unclosed machines "F," "B" and "C."

Finally—After this testimony, and after his memory was refreshed by the card, the witness distinctly and emphatically states to the complainants that his testimony for defendants, as above analyzed, is correct, and says his memory is unchanged. (Complts. II, 1,218.)

Any one of the foregoing reasons are a more complete explanation of the card, than the assumption that this reputable and unimpeached citizen and the host of corroborative witnesses are perjurers, or that Drawbaugh did not advertise the telephone because he did not have it.

Cyrus Orris: Miller. *(Dfts. 1, p. 170).*

Ezekiel Worley (*Id., p. 253-5*): Corroborated by John K. Taylor (*Id., p. 632*).

David K. Ernst (*Id., p. 618*).

David M. Dittlow (*Id., p. 573-4*).

Mrs. Lydia Drawbaugh (*Id., p. 694-6*).

George Natcher (*D. S. Reb., p 141-8*).

Mrs. B. B. Spangler, sister of George Natcher (*Id. p. 176-8*).

George Frederick (*Id., p. 328*).

Henry M. Hamme (*Id., p. 322*): As to January and February, 1876.

DATES.

Of the foregoing witnesses, all, with the exception of those where later dates are given (eight), give their testimony as to having seen or talked with the machines prior to June 2, 1875, the date of Bell's invention; and in every case the testimony shows that the date has been fixed accurately by collateral and convincing circumstances. To illustrate, the dates are as accurately fixed in a great majority of instances as in the case of ex-Congressman Haldeman, of Harrisburg. But to corroborate the dates we call a number of witnesses, who testify as to being told of the machines and of the common report of the machines at the dates which the foregoing witnessess have fixed as the time they saw them; and this latter class of witnesses as accurately fix the dates. There would seem to be no possible collusion here, as when a witness has testified to a collateral fact, we have in almost every instance called a stranger to the witness, giving the direct testimony, to establish the date of such collateral fact.

Huyler (Id. p. 375).
Byers (Id. p. 509).
Strong (Id. p. 375).
Byers (Id. p. 382).

HENRY SNYDER (Id. p. 513): This witness testified in the original record, of Drawbaugh's application to him for assistance ; could not fix the date accurately, but thought it was a little earlier than 1875. On sur-rebuttal, Maj. Snyder, since giving his testimony, having died, we called his son, John H. Snyder (Sur-reb., p. 160), and a neighbor, Edward W. Eby (Id. p. 179), who fix the date with absolute certainty as not later than June 19, 1873, Maj. Snyder having pointed out to them Daniel Drawbaugh, and having related to them that he was trying to get him into partnership in a talking machine. Eby fixes the date, because after that date he and Maj. Snyder fell out on a settlement, and were not on speaking terms. The settlement itself is produced, bearing date June 19, 1873.

To illustrate the method of fixing these dates, Spafford and McHenry (D. S. Reb. pp. 1,089-92), and Bricker (Id. p. 1,083), were commissioners appointed under an act of the Pennsylvania Legislature, of April 3, 1869, printed on Dfts. S. Reb. 1,089. Having filed their report of the complete adjustment in the Court of Common Pleas of Clinton County, November 1, 1869, — a certified copy is shown in this record (Id. p. 248-9). They never saw each other after this survey was completed until they met in Harrisburg to testify in this case. Bricker (Ans. 19, 22), Spafford, (Ans. 11), McHenry, (Ans. 5 and 8). Spafford and McHenry were persons of high standing in the community, and were personally named in the act of April 3, 1869, as commissioners for this important work. Spafford and McHenry were never in Milltown, but heard of Drawbaugh's talking machine from Bricker in October, 1869, while adjusting the Clinton County line, and it was talked of fully by the commissioners at that time. Bricker got his information with regard to it from Henry Drawbaugh at Newville.

Bolye, Brenziger, Goldsmith, Irwin, McGaffic, Stackpole, John H. Updegraff, Mrs. Fry, Mr. Hake, Mr. Young, Mr. Strouse and Mr. Weaver. (Add. proofs, 40, 44, 91, 81, 36, 72, 83, 120, 107, 97, 93, 100), fix the date of Dr. C. E. Updegraff's visit at May 1, 1875, and the dates are fixed by these witnesses conclusively by fixing the time of the visit and the place they started from in Harrisburg and the details of the visit, through the records of the Odd Fellows' lodge, of the places they were boarding in, and by the testimony of fellow-boarders, and of their telling of the talking machine on their return.

THE IDENTIFICATION OF THE MACHINES.

The witnesses for the defense who saw and talked through the machines, identify them as of dates, in harmony with Drawbaugh's testimony as to making them, which, according to the latter's testimony, were in the succession already shown, down to and including "D" and "E," (which are conceded by the other side to have been perfected machines), and all prior to March, 1875.

THE NEW YORK AND PHILADELPHIA TESTS OF THE REPRODUCED TUMBLER INSTRUMENT "F" AND THE TIN CAN INSTRUMENT "B," AND THE MAGNETO INSTRUMENTS "C" AND "I."

A number of the original parts of these instruments exist and are in evidence, and from the parts and from the testimony of Drawbaugh and other witnesses describing them, reproduced instruments were constructed, in order to show the court how they appeared and acted, when completed in all their parts. Of the reproductions "F" was the only one of the four which was a carbon instrument.

It is in evidence that they had been made some time before the New York tests, and had been very roughly handled, and their adjustments were in a loose and shaky condition. It is said that these instruments failed to operate successfully in the New York tests, although they all transmitted words, and even sentences. The court below lays great stress upon the failure of these instruments to do satisfactory work in these tests. The instruments were again reproduced and properly adjusted at Philadelphia, and worked perfectly. It was impossible for the complainants' experts to find any difference between the reconstructed and adjusted machines tested at Philadelphia and the description of them and of their parts and adjustment, as given by Daniel Drawbaugh in his testimony in 1882. It is difficult to see how the criticism could be justly made that the witnesses who testified that they talked through these old instruments, as they originally existed, must have falsified, because of any failure of the New York tests on the reproduced instruments, in the light of these considerations and in the light of the complainants' own testimony. In the original case, complainants' expert, Mr. Pope (*Comp. II, p. 1,419-22*), testified as follows, agreeing with the defendants' expert, Mr. Benjamin:

C. Q. 267.—"What mechanical part essential to a tele-" phone receiver, do you find in Bell's instrument, illustrated " in Fig. 7 of his patent of March 7, 1876, that you do not " find in Drawbaugh's instrument, 'Reproduced B'?

A.—" Nothing; I regard the two receivers as sub-" stantially alike.

C. Q. 268.—" What mechanical part essential to a " telephone transmitter, do you find illustrated in Fig. 7 of

" Bell's said patent, that you do not find in Drawbaugh's " instrument, 'Reproduced B'?

A.—" No essential part, but in answering this I assume " that a source of electricity must be used in connection " with each to constitute it a transmitter. The instruments " themselves are substantially the same.

C. Q. 269.—" A continuous electric circuit, including " a battery and two of Drawbaugh's 'Reproduced B' in" struments would present substantially the same contriv" ance and arrangements as is shown in Fig. 7 of Bell's " patent of March 7, 1876; would it not?

A.—" It would.

C. Q. 270.—" What mechanical part essentially to a " telephone transmitter or a telephone receiver do you find " represented in Fig. 7 of Bell's said patent that is not " contained in Drawbaugh's reproduced instruments 'C' " and 'I'?

A.—" Assuming 'C' and 'I' to be coupled together " in a continuous circuit, there appears to be nothing " essential contained in Fig. 7 of the patent that is not " found substantially in instruments 'C reproduced' and " 'I reproduced.'

C. Q. 271.—" Answer the same question, assuming a " continuous circuit with Drawbaugh's instrument 'C re" produced' and his instrument 'A' in the line?

A.—" I make the same reply to this question, with the " understanding that a battery is placed in the continuous " circuit with the Drawbaugh instruments.

C. Q. 272.—" Answer the same question, assuming a " continuous circuit with a battery and with Drawbaugh's " instrument 'I reproduced' and his instrument 'A' in " the line?

A.—" The same answer is also applicable to this couple.

C. Q. 273.—" Answer the same question, with Draw-" baugh's instrument 'B reproduced' and his instrument " 'F' in a continuous circuit with a battery?

A.—"The same answer is also applicable to this couple.

C. Q. 274.—"Answer the same question, with Draw-" baugh's instrument 'B reproduced' and his instrument " 'D' in a continuous circuit with a battery?

A.—"*Assuming 'D' to be in a working condition,* " *which it was not when I saw it, I again repeat the* " *answer with reference to this couple.*

C. Q. 275.—"Answer the same question, with Draw-" baugh's instrument 'C reproduced' and his instrument " 'E' in a continuous circuit with a battery?

A.—" I again repeat the same answer as to this couple.

C. Q. 276.—" Answer the same question, assuming " Drawbaugh's instrument 'I reproduced' and his instru-" ment 'E' in a continuous circuit with a battery?

A.—" I repeat the same answer as to this couple.

C. Q. 277.—" Answer the same question, assuming " Drawbaugh's instrument 'C reproduced' and his instru-" ment 'D' in a continuous circuit with a battery?

A.—" I repeat the same answer, on the assumption, " as before, that 'D' is in working order.

C. Q. 278.—" Answer the same question, assuming "Drawbaugh's instrument 'I reproduced' and his instru-" ment 'D' in a continuous circuit with a battery?

A.—" I repeat my answer, which is the same as to the " preceding question.

C. Q. 279.—"Answer the same question, assuming " Drawbaugh's instruments 'D' and 'E' in a continuous " circuit with a battery?

A.—" My answer is the same as to question 277."

(Recess until 3 P. M.)

C. Q. 280.—" Answer the same question, assuming " a continuous circuit with a battery, with Drawbaugh's " instruments 'A' and 'reproduced B' in line?

A.—"*I find no mechanical part essential to a telephone " transmitter or telephone receiver represented in Fig. 7 " of Bell's patent that is not contained in the instruments " referred to in the question*, assuming, as before, that they " are placed *in a continuous circuit with a battery*.

C. Q. 281.—" Answer the same question, assuming " Drawbaugh's 'reproduced B' and 'reproduced C' in a " continuous circuit with a battery?

A.—" I repeat my last answer as to this couple.

C. Q. 282.—" Answer the same question, assuming " Drawbaugh's 'reproduced B' and 'reproduced I' in a " continuous circuit with a battery?

A.—" I repeat my answer to question 280, as to this " couple.

C. Q. 283.—" Answer the same question, assuming " a couple of Drawbaugh's instruments 'reproduced C,' in " a continuous circuit with a battery?

A.—"I repeat my answer to question 280, as to this " couple.

C. Q. 284.—"Answer the same question, assuming a " couple of Drawbaugh's instruments 'reproduced I,' in a " continuous circuit with a battery?

A.—" I repeat my answer to question 280, as to this " couple.

C. Q. 285.—" Answer the same question, assuming a " couple of Drawbaugh's instruments 'E' in a continuous " circuit with a battery?

A.—" I repeat my answer to question 280, as to this " couple.

C. Q. 286.—" Answer the same question, assuming

" Drawbaugh's instruments 'A' and 'E' in a continuous " circuit with a battery?

A.—" I repeat my answer to question 280, as to this " couple.

C. Q. 287.—" Answer the same question, assuming " Drawbaugh's instruments 'A' and 'D' in a continuous " circuit with a battery?

A.—" I repeat my answer to question 280, as to this " couple, assuming 'D' to be in its original uninjured con- " dition.

C. Q. 288.—" *Answer the same question, assuming a " couple of Drawbaugh's instruments 'D' in a continuous " circuit with a battery?*

A.—" *I repeat my answer to question 281, as to this " couple, assuming 'D' to be in its original uninjured " condition.*

C. Q. 289.—" In a speaking-telephone line, it is not " necessary to have a battery in the line, provided the " electro-magnet of the transmitting instrument is polarized " by a permanent magnet; is it?

A.—" It is difficult to get any results without a bat- " tery, unless the transmitting and receiving instruments " are both polarized. *The results are, at least, very infe- " rior, and I should rather say that the battery is necessary, " unless both batteries are polarized.*

C. Q. 290.—" *In Drawbaugh's instruments, 'D,' " 'E,' 'Reproduced C' and 'Reproduced 'I,' the electro " magnets are polarized by a permanent magnet, are they " not?*

A.—" *They are.*

C. Q. 291.—" Suppose we should couple those instru- " ments together in a continuous circuit without a battery " in any of the following couplets, to wit: C and D C;

" and E; C and I; D and E; D and I; E and I; or should " use a pair of the same instruments as C and C; D and D; " E and E; or I and I; what part essential to a speaking " telephone transmitter or receiver do you find represented " in Fig. 7 of Bell's patent of March 7, 1876, that you " would not find contained in each of said couplets?

A.—" *Every part essential to a speaking telephone* " *transmitter or receiver, which is represented in Fig. 7,* " *of the patent, is represented by a corresponding part in* " *each of the couples enumerated in the question. The* " *construction is not precisely the same, nor are the proportions similar in many cases. And the source of electricity, which in the patent is a battery, is replaced by a* " *permanent magnet in each of the couples.*"

We now quote from the same expert as to the reproduced instruments which were satisfactorily tested at Philadelphia. (*Add. proofs, p. 422, Ans. 4.*)

" I have compared the instruments referred to in the " question very carefully, part by part. The Philadelphia " instruments are constructed in a much more thorough and " workmanlike manner than the New York instruments, and " are generally much better finished. Every separate part " of each of the Philadelphia instruments is of better workmanship and better proportion than the corresponding " parts of the New York instruments. *One very important* " *point of superiority in the Philadelphia instruments is the* " *rigidity of all the parts intended to be fixed, and the* " *greater accuracy of movements in the adjustable parts,* " *thus affording an adjustment which is positive, and which* " *may be relied upon to maintain itself, while at the same* " *time it may be made very delicate.*"

" In respect to the transmitters, I noted especially " that the diaphragms were well made, carefully fitted into "their seats, and rigidly clasped; that the rods were "securely fastened and the plunger very securely fitted, "yet capable of moving freely in the tumbler containing "the carbon powder. All these improvements are of a "character to greatly increase the efficiency of the apparatus,"

It is difficult to see wherein the essential parts of these machines differ, and it is perfectly plain that the New York tests failed of perfect action from the rough treatment the machines had had, and, from having been shaken out of adjustment. Complainants' witness, Prof. Wright, of Boston, in his notes of the tests of the instruments used in New York, states the results as follows: "'F', reproduced as transmitter; Drawbaugh talking, "Tisdale receiving — heard very well; understood very "well, numerals counted, and conversation." Whatever instruments were used by complainants' experts, Pope, Cross and White, in their private tests, were not put in evidence, and they were unable to say they were reproductions of the instruments used at New York and Philadelphia, and they never tested the reproductions used by Prof. Barker at Philadelphia. (See Pope, cross interrogatory, p. 23.)

The evidence of the Philadelphia tests appears at p. 543 Additional proofs; the New York tests, 4 Complts., pp. 481, 474; Complts. Exhibit 4.

RECAPITULATION.

One—The defendants' testimony-in-chief, excluding Drawbaugh's, is of such positive character, relating to exceptional and unusual facts; is so copious from many and widely disconnected sources, and withal so consistent and harmonious, that, in the language of the learned Judge below, it "IS SUFFICIENTLY FORMIDABLE TO OVERCOME "THE LEGAL PRESUMPTION OF THE VALIDITY OF THE "COMPLAINANTS' PATENT." (Opinion, p. 21.)

Two—The complainants' proofs in reply, do not, under the settled policy of the law of evidence, create a flaw upon the face of the case made, much less destroy it.

Three—Case authorities to the point that doubtful direct testimony in support of the claims of an alleged inventor, may be overthrown by evidence of his inconsistent conduct, fraudulent fabrications or evil tendencies, have no application in weighing direct evidence of the higher order presented here. If it had been shown that he was a rogue and a falsifier, Drawbaugh would not be beyond the pale of the law for the protection of inventors, if the evidence otherwise established his claim to an invention.

Four—But Drawbaugh's story, his character and conduct, and the conditions in which we find him, are all consistent with, and corroborate, the case otherwise made.

In this regard every premise of the opinion below, upon which this decree rests, is at fault. These premises are:

(*a*.) That a man of Drawbaugh's education and environment could not have invented the telephone.

(*b*.) That a man who busies himself with minor "mechanical contrivances" could not have produced a great invention. In other words, a great discovery in physics could not be made by a man unless his mind had always been on great discoveries; an *a priori* argument that to establish a claim to a great invention, the claimant must show some previous invention approximately as great.

(*c*.) That the issue of an advertising card, to the farmers, millers, mechanics and housewives of a country village, soliciting trade for his shop, is an admission that he was not working upon and had no telephone at a period when seventy unimpeached witnesses, and himself, testify positively that he had the telephone, and that he was so working at that time.

(*d.*) That Drawbaugh fabricated the story of his poverty, when the court records of his judicial district show judgment after judgment against him, on claims for the necessaries of life, medical attendance for his fatally ill children, and for the roof that covered his head; and when the community in which he lived corroborates the record.

(*e.*) That Drawbaugh was a charlatan, beause a provincial scribbler was florid in the style of a printed notice of him.

(*f.*) That Drawbaugh and these witnesses, when they say that they talked through the more or less crude instruments made prior to 1875, falsify, or are mistaken in their statements, on the following grounds:

Some of the original parts having been lost or worn out, two sets of reproductions were made, both in exact correspondence with the original machines, and when tested at different times, one set being older and shaken out of adjustment, did not work perfectly; though the other, with accurate and firm adjustments, stood all the tests as practical telephones.

We submit that the decree should be reversed and the bill dismissed.

DON M. DICKINSON,
Of Counsel.

STATEMENT OF ERRORS.

1. The court below erred in holding the Bell patents in suit, or either of them, valid.

2. It erred in holding said patents, or either of them, to have been infringed by the defendants, or any of them.

3. It erred in holding that Daniel Drawbaugh was not the first and original inventor of the inventions here in suit.

4. It erred in not holding Elisha Gray to have invented the electric speaking telephone, in its variable resistance

5. It erred in not holding the Bell patent of March 7, 1876, here in suit, to be fraudulent and void, in view of the evidence as to fraudulent changes in the application therefor, and the fraudulent introduction of Gray's inventions into said application, while pending in the patent office.

6. It erred in not holding the Bell patent of January 30, 1877, here in suit, to be fraudulent and void, in view of the evidence as to the fraudulent introduction of Elisha Gray's said inventions into the same.

7. It erred in not holding Bell to have surreptitiously and unjustly obtained both of said patents for that which was in fact invented by another (to wit: by Elisha Gray), who was using reasonable diligence in adapting and perfecting the same.

8. It erred in not holding Bell to have surreptitiously and unjustly obtained both of said patents for that which was in fact invented by another (to wit: by Daniel Drawbaugh), who was using reasonable diligence in adapting and perfecting the same in his various improved instruments.

9. It erred in not dismissing the appellees' bill for want of equity and right, in view of the frauds shown by the appellees' own evidence to have been perpetrated upon the Patent Office, Elisha Gray and the public in the procurement of the patents, and remaining in the patents, on which said bill is founded.

10. It erred in construing said patent of March 7, 1876, here in suit, to cover anything more than a magneto-electric current generated by the vibration, by sound waves, of a body of inductive material in the presence of a body susceptible of receiving induction therefrom; and it further erred in not holding such a patent for a *current* to be a

patent for an "effect," "mode of operation" or "principle," and therefore void.

11. It erred in not holding said patent of March 7, 1876, to be limited to the described apparatus of its figure 7—there being, as the appellees contend, no "art" then known, and there being no equivalents for this apparatus described in the specification.

12. It erred in not holding said patent of January 30, 1877, to be invalid and void, by reason of its claiming matters described and shown, but not claimed in Bell's prior patent of March 7, 1876, the application not having been filed till after the former patent was issued, and said matters not having been reserved in said prior patent as matters to be afterwards applied for, but having been abandoned to the public by describing and showing without claiming them, in said prior patent.

13. It erred in not limiting the scope of the claims of the patent of January 30, 1877, here in suit, to mere improvements in the form of the parts mentioned in said claims.

14. It erred in holding that the specification of Bell's patent of March 7, 1876, describes the speaking telephone invention with the clearness, fullness and exactness which the statute requires in such cases; and that the patent is not invalid for want of a proper description and specification of said alleged invention.

15. It erred in holding that Bell, in the sense of the patent law, completed or made any invention of an electric speaking telephone before a date later than March 7, 1876; and, therefore, in not holding the patent void, as being for an invention not made, at or prior to its date, by the patentee.

16. It erred, throughout its opinions in the case

against the People's Telephone Company, in treating of the evidence as to Drawbaugh's priority of invention, by ignoring, misconstruing, misstating, and misunderstanding the evidence; by assuming things of which there was no evidence, or which were contrary to the evidence; by misunderstanding and misapplying the law; and by attributing different degrees of probative force to the same kinds of evidence accordingly as it found the same on the one side or on the other side of the case. These errors are too numerous to be set out here in detail, but reference for them is to be made to appellants' brief on the Drawbaugh evidence herewith filed, pages 277 to 311 inclusive, where the same are set forth in detail.

L. HILL,
Of Counsel for the People's Telephone Co.,
and the Overland Telephone Co., Appellants.

Supreme Court of the United States.

vs.
SAME,
Appellees.

Appellants' Brief on the Bell Patents.

In this brief, we shall first review the history of Alexander Graham Bell's connection with the invention of the Electric Speaking Telephone, and shall then consider the questions of what he attempted to patent; after which, we shall discuss, in their logical order, various matters that we regard as conclusive of the invalidity of both patents, as well as of non-infringement by the appellants.

For convenience and clearness we prefer to discuss the history of Mr. Bell's connection with the development of the speaking telephone in the form of a review of his own account of it, as contained in a preliminary statement filed by him in the telephone interference in the Patent Office, in November, 1878.* (C. Exhibits, p. 997.)

---

* NOTE.—The appellee's four volumes of proofs will be cited in this brief as C., Vol. 1, C., Vol. 2, C., Vol. 3, C., Exhibits, or Vol. 4—C. meaning complainant below.

The appellant's six volumes will be cited as D., Vol. 1, D., Vol. 2, D. S-reb., D. S-rej., D., Exhibits, and D. Add. Proofs.—D. meaning defendant below.

This preliminary statement is as follows:

DEFENDANTS' EXHIBIT BELL'S PRELIMINARY STATEMENT IN THE "SPEAKING TELEPHONE INTERFERENCES."

Complainants' Record, page 1695.

IN THE MATTER OF THE INTERFERENCE
between
ALEXANDER GRAHAM BELL
and

PRELIMINARY STATEMENT OF ALEXANDER GRAHAM BELL.

I am a native of Great Britain, and left that country in 1870, for Canada. My chief subject of study from my boyhood upward has been the mechanism and nature of speech. The fact that this study has been my father's professional pursuit had directed my own studies in the same direction, and my father always intended that I should follow the same pursuit. *Two or three years before I left England I became acquainted with Helmholtz' experiments concerning the analysis and synthesis of vocal sounds. I was especially interested in his experiments for reproducing vowel sounds by means of tuning forks set in vibration by electrical currents.*

On thinking over these experiments, the thought occurred to me that if it were possible to reproduce vowel sounds by means of an electrical current, surely some means could be found to reproduce electrically the other elements of articulate speech, and that it would become one day feasible to speak by telegraph. I had at this time too slight a knowledge of electrical subjects to apprehend fully the operation of the apparatus employed by Helmholtz *and I did not then form any idea of any means* by which my conception of the possibility of producing articulate sounds, other than those which Helmholtz had produced, could be accomplished. *I did not even at that time propose to attempt the solution of the problem.* I merely looked upon it as a problem that some one would surely solve. The explanation which was given me of Helmholtz' experiments so interested me that I devoted myself to the study of electricity, my special object being to acquire a sufficient knowledge of the subject to enable me to understand Helmholtz' experiments. I was thus led to the study of telegraphy as a branch of electrical science, and to the conception of a method of transmitting simultaneously, along a single circuit, a number of distinct telegraphic messages by means of musicial sounds of long or short duration, giving signals to the ear similar to those that the Morse recording instruments give to the eye. The plan which I conceived was to use transmitting instruments of different pitch, each similar to the transmitting tuning fork employed in Helmholtz' vowel experiments, the receiving instrument to consist of an instrument like a piano with electro-magnets beneath the strings. I conceived that a current from a local battery, connected with each tuning fork, could be sent over a main line and set in vibration the string corresponding in pitch to that of the tuning fork brought into the main circuit.

The interruption of this current by a key for longer or short intervals might be made to give sound signals from the receiver corresponding to the visible signals made by a Morse recorder. I did not construct this apparatus while in England, but I made some efforts to reproduce the experiments of Helmholtz.

After arriving in Canada, I pursued my electrical and acoustical studies, and made such experiments relating to multiple telegraphy as I had the means of making at my father's residence. I had good facilities for study, but very insufficient means for experiments. In October, 1872, I removed to Boston with the intention of making the United States my permanent residence. My professional occupation at this time was giving instruction in articulation to deaf mutes and lecturing upon the mechanism and nature of speech to teachers of the deaf and dumb who came to me from different parts of the world. My spare time I devoted to electrical studies and experiments with a view to perfecting multiple telegraphy.

In developing my plan of multiple telegraphy certain difficulties made their appearance, and I devoted myself during a summer vacation spent in Canada, in 1874, to devising means to overcome these difficulties, and also to devising new methods of studying sound optically, as aids in teaching articulation to the deaf. The means I proposed to employ for transmitting musical signals simultaneously in both directions along the same circuit was to induce an intermittent current upon the line wire, by opening and closing with extreme rapidity the primary circuit of an induction coil the secondary wires of which were in circuit with the line. Upon reasoning out the effects produced, I saw that a current in one direction would be induced in the secondary circuit when the primary circuit was closed, and a current in the other direction when it was opened, and I feared that the alternate, positive and negative impulses would be insufficient to set my receiving instrument into musical vibration, unless these impulses, which acted upon the plate or spring, were at equal intervals apart, and the plate or spring, which constituted the armature of the receiving electro-magnet was itself permanently magnetic, so as to be attracted and repelled as the pole of the electro-magnet was changed by the reversal of the current.

To make this plate permanently magnetic I proposed to attach it to one pole of a permanent magnet. It then occurred to me that if this magnetic vibrating plate or armature were set in motion mechanically, it would induce positive and negative currents like those which I had proposed to send through the instrument to set the armature in vibration; I then saw that two similar instruments might be placed in a circuit and that the vibration in the armature of one would produce corresponding vibration in the armature of the other, and if the vibration of the armature of the inducing instrument was such as to produce a musical tone, the corresponding vibration of the other armature would produce the same musical tone. It will be understood, of course, that both armatures were to be tuned to the same pitch.

I then conceived the plan of attaching a number of springs, of different musical pitch, to each pole of a permanent horseshoe magnet, so that the two sets of springs should lie in parallel planes; between the ends of these springs, which by their attachment to the permanent magnet became themselves magnets, an oblong electro-magnet was to be placed.

The vibration of any one or more of the springs would induce corresponding electric currents in the electro-magnet when its circuit was closed, and if a second similar instrument was placed in the circuit I conceived that the armatures of this instrument would vibrate, which corresponded in pitch to those which were vibrating in the first instrument, and would give out the same musical tones. It then occurred to me that, not only would the armatures of the second instrument respond to notes of similar pitch, but that the loudness of the sounds produced would be dependent upon the amplitude of vibration of the armature of the first instrument, for the strength of the electrical impulses produced by the armature of the first instrument, would depend upon the amplitude of their vibration, and the amplitude of the vibration of the armatures of the second instrument would depend upon the strength of the electrical impulses; hence, if a number of armatures of the first instrument were to be set simultaneously in vibration with different relations of force, the corresponding armatures of the second instrument would be thrown into vibration with corresponding relations of force.

It at once occurred to me that the results obtained by Helmholtz in the reproduction of *vocal sounds* might be obtained by this instrument. Helmholtz obtained his effects by causing tuning forks of different pitch to vibrate simultaneously, increasing the loudness of the sounds by external re-enforcement by the means of resonators. It seemed to me that *the same result* could be obtained by causing the armatures of my instrument to vibrate with greater or less force, and that this could be done by simply uttering a sound in the neighborhood of the first instrument. When a sound is uttered in the neighborhood of a musical instrument, like a piano or harp, each vocal sound is analyzed by the instrument into its component musical elements, and those strings of the piano or harp which correspond in pitch to the fundamental and overtones of the sound, are thrown sympathetically into vibration by the action of the air, and the relative amplitudes of the vibrations of the different strings correspond to the relative loudness of the fundamental and overtones of the sound. Hence I conceived, that if a sound should be uttered in the neighborhood of the first instrument, certain of the armatures, corresponding in pitch to the fundamental and overtones of the sound uttered, would be thrown into vibration with the proper relations of force, and the armatures of the second instrument corresponding in pitch to the fundamental and overtones uttered, would be thrown into vibration with corresponding relations of force, and would thus produce a sound having the same components as the original sound. Reflecting upon this arrangement and its likeness to the internal organ of hearing in the human ear, known as Corti's organ, convinced me that *if we could have a multitude of armatures comprehending the whole scale of musical sounds audible to the human ear, the successive notes being so close together as only to differ infinitesimally from one another in pitch*, then upon speaking to such an instrument, the consonant and vowel sounds affecting the armatures of the first instrument would be reproduced by the armatures of the second instrument.

In fact sounds or noises of any kind made in the neighorhood of the first instrument would be reproduced by the second instrument.

All these reflections occurred during this visit in Canada in the summer fo 1874. At the same time, as I have already mentioned, I was making an optical study of sound for the purpose of exhibiting to the eyes of the deaf the shapes of the vibration due to vocal sounds, so that they might compare these shapes with the shapes which they, in their own attempts to produce sounds, saw exhibited in the manometric flame of Koenig.

For that purpose I had taken with me to Canada a human ear in hopes that I might be able to use the ear itself as a phonautograph, as suggested to me by Dr. Clarence J. Blake, of Boston, who kindly lent me the ear to experiment with.

I have still in my possession a number of glass plates with tracings of the vibrations of the human ear, caused by uttering different vocal sounds. These tracings bear dates in July and August, 1874, which dates were made upon the plates at the time the tracings were taken.

Studying these tracings in connection with Helmholtz' researches, I was led to see that they represent graphically the resultant vibration of the air caused by the fundamental and overtones of the voice. I was also struck with the fact that so small and delicate an organ as the membrane of the ear should be able from the impulses of the air to put in motion the comparatively large and massive bones contained in the tympanum.

Helmholtz has pointed out that a graphical representation of the vibrations of the air caused by simple musical tone, or in other words, a simple pendulous vibration is a simple curve of a peculiar kind, called a sinusoidal curve, and that the graphical representation of the vibration of the air, caused by a sound of any other kind is the resultant of a number of sinusoidal curves superposed, one upon the other, representing graphically the fundamental and overtones that go to make up the sound.

I conceived in like manner that an analogous electrical effect would be produced upon the line wire between the first and second instruments previously described, caused by the superposition of currents due to the vibrations of the armatures corresponding to the fundamental and overtones of the sound uttered.

I was thus led to the idea that a single armature might be put in motion in such a way as to produce directly a current which should correspond to the resultant current due to the vibration of the armatures which would respond to the fundamental and overtones of the sound.

The question then arose in my mind, whether an armature might not be set in motion by a membrane similar in shape and structure to that in the human ear, so as to produce a current which should correspond to the vibrations of the air. *I did not, at this time, devise any method of combining a membrane with an armature or attempt to construct any apparatus upon the plans I had conceived.* I now constructed the instrument which I have described, made up of a number of armatures attached to a permanent magnet and tuned to different pitches, and which I had devised with special reference to multiple telegraphy, *because I thought that the currents which would be induced, would be so exceedingly weak that no useful effect would be produced by them corresponding to what I had theoretically attributed to them.* I therefore *turned my attention to other modes* of working out my plans of multiple telegraphy, which I was thoroughly bent upon reducing to practice immediately. I did, however, explain to my father and to other friends, in Canada, my ideas as they occurred.

When I returned to Boston in September or October, 1874, being without means of prosecuting my experiments, I made arrangements with Mr. Sanders and Mr. Hubbard to furnish funds for the prosecution of my experiments, and to enable me to patent my inventions. *At their earnest request I devoted myself to the development of my system of multiple telegraphy, and applied for patents in the winter of 1874 and 1875.*

I did, however, shortly after my return from Canada, have several interviews with Dr. Blake for the purpose of showing him the experiments I had made and of obtaining further information with regard to the structure and mechanism of the human ear, to aid me in my efforts to devise a method of producing vocal sounds electrically; and we carried on, conjointly, a series of experiments to obtain tracings of the vibration of the bones of the human ear. At one of these interviews I explained to him the various plans which had occurred to me for multiple telegraphy and the transmission of speech; and I made a number of rude sketches in his presence, illustrating these plans. Among them is to be found a sketch of an instrument showing two free reeds or springs attached to the poles of a permanent magnet and surrounded like harmonium reeds with casings adapting them to be vibrated by wind. Another figure on the same sheet exhibits two horseshoe permanent magnets with their poles placed opposite each other, surrounded by helices forming part of an electric circuit. Between the poles of the magnets vibrating reeds are placed, which were to be of steel. The mechanical vibration of these reeds would produce electrical currents alternately in one direction and the other, and varying in strength at different parts of the vibration of the reeds, so as to produce an undulatory current regular in point of time, but varying in strength during any single vibration of the reed, in proportion to the different velocity of the reed in the different parts of its path.

On the same sheet is a representation of the instrument I have before referred to, where several springs were attached to the poles of a permanent magnet having between them the poles of an elongated electro-magnet, over a portion of which each spring could vibrate.

I am certain that I made sketches of these devices while in Canada, but I am unable to find any earlier than these given to Dr. Blake.

I had an apparatus constructed for a receiving instrument, in which a free reed, to be set in vibration by an electro-magnet, and produce a musical sound, was attached to the pole of a permanent magnet. This was in the winter of 1874 and 1875, and is described in one of my applications for patents made in February, 1875.

While in Washington attending to this business I called upon Prof. Henry and explained all my inventions to him.

His appreciation encouraged me very much, and *he pronounced my plan for the electrical production of articulate speech the germ of a great invention.*

I recollect explaining to him the idea of an instrument with a number of armatures tuned to different pitches which I have be-

fore described, and it was with reference to this apparatus that he made the above remark. He showed me the various electrical and acoustic instruments which he had in the Smithsonian Institute *including Reis' telephone. I had previously seen in the Institute of Technology, in Boston, the receiving instrument of Reis' telephone; and was acquainted with the construction of the whole apparatus by diagrams and printed descriptions,* but I had never before seen the transmitting portion of the apparatus.

We had some conversation *about the mechanical power of stretched membranes,* I can not recollect the details of it, but I remember that the effect of his remarks was rather discouraging as to my being able to obtain the results from a stretched membrane which I had hoped. I remember that the impression left upon my mind *was that each stretched membrane would have a rate of vibration peculiar to itself.*

On my return to Boston from Washington, as my partners, Mr. Hubbard and Mr. Sanders, considered the system of autograph telegraph for which I had obtained Letters Patent, likely to be more immediately valuable than any others of my inventions. *I devoted my attention chiefly to the details of an autographic instrument,* but I continued studying the subject of the electrical production of articulate sound.

I had an apprehension, I may call it a belief, that the varying currents which would be produced by the means which had previously occurred to me, and to which I have already alluded, *would be too weak to produce the results which I desire to obtain; that they would not be able to set their armatures in vibration to the extent requisite to produce audible sounds.* I had then no idea of the extreme minuteness of amplitude which can produce a sound, and I remember that my thoughts were directed to utilizing the current derived from a battery, the strength of which should be made to vary by varying the resistance of the circuit through which it was passed. I sought to discover some method of varying this resistance proportionally to the varying vibration of the air. In a letter which I wrote to a friend on the fourth day of May, 1875, and which is now before me, I referred to this subject in the following language: "Another experiment has occurred to me, which, if successful, will pave the way for still greater results than any yet obtained. The strings of a musical instrument in vibrating undergo great changes of molecular tension. In fact, the vibration represents the struggle between the tension of the string and the moving force impressed upon it. *I have read somewhere that the resistance offered by a wire to the passage of an electrical current is affected by the tension of the wire.* If this is so, a continuous current of electricity passed through a vibrating wire should meet with a varying resistance, and hence pulsatory action should be induced in the current. If this turns out to be the case, the oscillations of the current should correspond in amplitude, as well as in the rate of movement, to the vibration of the string.

One consequence would be that the timbre of a sound could be transmitted. The plan for transmitting timbre that I explained to you before, viz., causing permanent magnets to vibrate in front of electro-magnets, is chiefly *defective on account of the feebleness of the induced currents.* If the other plan is successful, the strength of the current can be increased *ad libitum* without destroying the relative intensities of the vibration."

On the 2d of June, 1875, I wrote the following letter, referring to an experiment which I will relate:—

SALEM, MASS., June 2d, 1875.

DEAR MR. HUBBARD:

I have accidentally made a discovery of the very greatest importance in regard to the transmitting instruments. Indeed, so important does it seem to me, that I have written to the organ factory to delay the completion of the reed arrangement until I have had the opportunity of consulting you. *I have succeeded to-day in transmitting signals without any battery whatever.* The musical note produced at the receiving end was sensibly the equivalent of that at the transmitting end, in loudess *as well as pitch.*

I shall call upon you to-morrow (Wednesday) evening as there are several matters I wish to talk over with you. In haste. Yours Respectfully, A. GRAHAM BELL.

GARDINER G. HUBBARD, Esq., Brattle Street, Cambridge.

I had arranged an apparatus relating to multiple telegraphy, which consisted of several transmitting instruments and two sets of receiving instruments to correspond, representing three stations on a circuit. The transmitting instrument consisted of a steel spring, which was thrown into vibration by the action of an electro-magnet and local battery. In the course of its vibration it struck alternately two fixed platinum points, one connected with the local circuit the other with the main. The depression of a key directed the intermittent current from the main battery on to the line wire through the receiving instruments.

Each receiving instrument consisted of U-shaped electro-magnet having a coil upon only one of its legs; a metal spring was clamped firmly to the uncovered leg of the magnet and its free end was over the other pole. When an intermittent current passed through the coil of the receiver, the spring armature was set in vibration, when its normal pitch corresponded to the pitch of the transmitting instrument which interrupted the current.

On the 2d of June I was trying this apparatus with my assistant, Mr. Watson. I was at the transmitting station where I operated the keys. The receiving instruments of the second station were in the same room where I could observe them. Those of the third station were in an adjoining room, under the observation of Mr. Watson. I pressed down the keys of the transmitting instruments successively, and the corresponding receivers responded, excepting in one case.

Thinking that the spring armature of this receiver at Mr. Watson's end might be sticking to the pole of the magnet underneath, I called to him to pluck it up. At the moment he did so, I observed that the armature of the corresponding receiver at the second station was thrown momentarily into vibration, although I had depressed none of the transmitting keys, so that there was no battery upon the circuit. This seemed to me so extraordinary that I immediately determined to investigate the matter, and called to Mr. Watson to continue plucking the spring until I told him to stop. I cut the line wire between the transmitting instruments and my receiving instrument, and made a circuit through the receiving instruments independently of the battery, and the effect was produced as before.

I then silenced the transmitting instruments and placed the spring armature of each of the receiving instruments against my ear, and heard distinctly in every case the sound of Mr. Watson's plucking the spring, although only the armature of the instrument corresponding to the one plucked was thrown into visible vibration.

I also recognized the timbre of the sound produced by the plucking of the spring. We finally removed all the receiving instruments from the circuit except two, one at each end.

The same effects were observed, although neither permanent magnet nor battery was included in the circuit.

At once my speculations in Canada, in the summer of 1874, occurred to my mind, and I saw that I had been hasty in coming to the conclusion that magneto-electric currents, induced by the vibration of a plate or spring, would be too feeble to set corresponding armatures in vibration so as to produce audible effects; for, in the experiment I had just made, the residual magnetism of the armature and core of the electro-magnet, though it must have been exceedingly slight, was able, when the spring was thrown into vibration, to induce a current sufficiently strong to set the armature of the other instrument in the circuit into visible vibration so as to produce audible effects.

It will be noticed that *the apparatus I have just described is essentially the same as that represented in Fig. 5*, of the drawings annexed to the patent granted to me March 7th, 1876, and numbered 174,465, which is the subject of this interference, excepting that a battery is included in the circuit in the drawing, to give a greater amount of magnetism in the core of the electro-magnet. I did, in fact, on the second day of June, 1875, repeat these experiments with a battery included in the circuit, and then completed so much of the invention embraced in that patent as is represented in said Fig. 5.

My mind immediately recurred to the use of a membrane as a means of operating an armature so as to correspond with the vibrations of the air caused by vocal sounds; and either on the same day, *or shortly after*. I gave orders for the construction of two instruments in which the armature of an electro-magnet should be moved by the vibrations of a stretched membrane, to which it was connected.

Such an instrument was constructed by Mr. Watson, during the month of June, 1875, but I am unable to fix the exact day.

Upon putting it into a circuit with a battery, the strength of the magnet and the weight of the armature were such as to tear the latter from the membrane, which was composed of gold-beater's skin.

Portions of this instrument are still in existence, and I annex a drawing, marked " A " which corresponds in size with the parts now in my possession, and which correctly represents, as I believe, the instrument as originally constructed.

So far as I can recollect, it was not until the first of July, 1875, that we were able to get the instrument in condition for trial. I fix this date and the nature of the experiment by a letter which I wrote on that day, a copy of which is as follows:

SALEM, MASS., July 1, 1875.

DEAR MR. HUBBARD:

The experiment to which I alluded when I saw you last promises to be a grand success. On singing this afternoon in front of a stretched membrane attached to the armature of an electro-magnet *the varying pitch of the voice* was plainly perceptible at the other end of the line, no battery or permanent magnet being employed when the vibrations are received upon another stretched membrane in place of a steel spring, it is possible—nay, it is probable—that the "timbre" of the sound may be perceived. I hope to try the experiment to-morrow afternoon. This morning in dipping into a French work upon telegraphy, I came across a full description of the "Typo-Telegraphe de M. Bonelli." I find it to be identical with our autograph arrangement, save that five telegraph wires are required instead of one for transmission. Bonelli gets over the difficulty of prepared ink by setting up his message in type. The brush of wires is passed over the raised surface of the letters securing perfect contact at the proper places. I have an engagement to meet Prof. Lovering to-morrow morning at ten o'clock, and shall call upon you before returning to town.

With kind regards,

A. GRAHAM BELL.

GARDINER G. HUBBARD, ESQ.,
Brattle Street, Cambridge.

I have not seen this letter since I wrote it, until within three days, and I had forgotten that I had made any such record of this experiment. It is obvious from this letter that the effects produced must have been due to the residual magnetism remaining in the armature and core of the magnet after having been previously magnetized by the passage of a battery current.

Another instrument with stretched membrane was immediately constructed and the experiment spoken of in said letter was tried of transmitting speech.

One instrument was placed in my experimental room at the top of the building, and the other in the work-shop below. I spoke from my room to Mr. Watson and he spoke to me from below. *I heard nothing*, but Mr. Watson soon rushed up-stairs and said he could hear my voice, *but could not make out what I said.* We then changed places, but *with the same result;* he heard my voice *but I could not hear his.* I am unable to say whether we used the instruments with a battery or without, as on the previous occasion refered to in the letter to Mr. Hubbard. *I am free to say that the results were not as good as I expected, but I believe that the failure to obtain better results was due to the imperfect construction of the instruments, or to their parts not being properly proportioned.* I fully believed that the elements combined in that apparatus were capable of giving better results than I attained in these experiments, and that the instruments embodied an important and valuable invention.

I saw clearly that a current was induced different from that which attended the use of any other apparatus with which I am acquainted, and which was characterized, not by makes and breaks of regular or irregular intervals or even by regular waves or impulses of equal strength or duration, but by impulses which corresponded to the vibration of the air which moved the membrane. I had combined elements which had never before been combined, and had produced entirely new results.

A few weeks after this I was obliged to go to Canada and I was therefore compelled temporarily to suspend my labors upon these inventions. I commenced the draft of the specification for my patent involved in this interference while I was in Canada, and I also endeavored to interest the Hon. George Brown, of Toronto, in my inventions, with a view to have him take out patents for me abroad.

I returned to Boston early in October and resumed work on my specification with a view to placing it in the hands of Mr. Brown, in case of his accepting my proposition. I delayed making out an application for a patent in this country, though repeatedly urged to do so by Mr. Hubbard, in order to make some arrangement with Mr. Brown or some other person to take out foreign patents. I heard nothing from Mr. Brown until my visit to Canada at Christmas, 1875. I visited Mr. Brown in Toronto, at his request, the 28th of December, 1875, and *on that evening, while in Toronto, I made rough pen drawings representing my various inventions, including the apparatus heretofore described, which was constructed in June, 1875, and tried on the first and subsequent days in July.*

Mr. Brown took the specification, and these drawings I had prepared, to England, but did not make an application. The specification and drawings have been in his possession ever since, till within a few days.

I annex a heliotype copy of one sheet of these drawings representing this apparatus, marked "B." There is also upon this sheet a memorandum referring to the trial of this apparatus, *which memorandum was made by me at the same time with the drawing.*

I completed the specification for my American patent early in January, and sent it to Mr. Hubbard in Washington, to be examined by Mr. Pollok. I am not able to fix the date when I sent it, but on the 18th of January I received a letter from Mr. Hubbard, expressing his satisfaction with it, and it must have been returned to me then or immediately after, as I made oath to it in Boston on the 20th of January, 1876, and sent it back to Mr. Hubbard. The reason why it was not filed immediately was that it was deemed important that I should meet Mr. Pollok and go over it with care.

We met in New York shortly after and spent a day in considering the specification. No change whatever was made in it, and Mr. Pollock took it back with him, and filed it in the Patent Office on his return.

I ought to state that I did not, before the filing of my application, construct the devices described in my specification for varying the resistance of a voltaic circuit as means for producing an undulatory current. I was in Washington *the first few days in March*, and *immediately on my return I constructed an apparatus having a wire attached to a stretched membrane, dipping into a vessel containing water*, forming part of a circuit, the resistance of the circuit being varied by the vibration of the membrane, which caused the wire to dip more or less deeply into the liquid. *On the 10th of March Mr. Watson and myself tried this apparatus as a transmitter, using the steel spring armature depicted in my patent as a receiver*, and obtained *intelligible articulation*. I exhibited an instrument constructed in this way at the Centennial Exhibition in June, 1876, before Sir William Thomson and other judges of his department.

(Signed) ALEXANDER GRAHAM BELL.

COMMONWEALTH OF MASSACHUSETTS, SUFFOLK, *ss:*

This twentieth day of November, 1878, personally appeared Alexander Graham Bell, and made oath that the foregoing statement by him subscribed is true. Before me,

[L. S.] CHAS. EUSTIS HUBBARD,
Notary Public.

To this statement it may be added that the devices exhibited by Mr. Bell at the Centennial were crude, experimental and imperfect; that he, during the following fall improved them and perfected his magneto-telephone; that on December 9, 1876, he applied for and obtained an English patent showing and claiming both the apparatus of his March 7, 1876, patent and the telephone improvements made after that date; and that on January 15, 1877, he applied for a U. S. patent for his telephone improvements, and obtained said patent January 30, 1877.

SUMMARY.

From this sworn preliminary statement the following facts clearly appear, viz:

First. That prior to the summer of 1874 Mr. Bell had formed no conception of any means for the transmission of speech.

Second. That in the summer of 1874, stimulated by Helmholtz' experiments in the electrical transmission of *vowel* sounds by means of a series of tuning forks of different pitch, Mr. Bell conceived the possibility of accomplishing "the same results" by substituting a series of vibrating reeds armatures in place of Helmholtz' tuning forks. (This imaginary apparatus which is generally referred to in the evidence as the "harp apparatus," is illustrated in Fig. 8, C. Vol. 1, p. 118, and is fully described in Mr. Bell's answer 37, pp. 118, 119, of the same volume.) But he never, then or at any subsequent time, made or attempted to make or test such apparatus, because he believed it utterly impracticable and incapable of producing any useful result.

Third. That in the summer or fall of 1874, he also formed an inchoate mental conception of the possible production of a similar result by means of a "*membrane similar in shape and structure to that in the human ear,*" but, although he spoke of the plan to Dr. Blake in October, 1874, he *did not devise any method of combining the membrane with an armature, nor attempt to construct any apparatus upon the plan*, because he believed it, like the "harp apparatus," to be utterly impracticable and incapable of producing any useful result.

Fourth. That in March, 1875, he explained his "harp apparatus" to Prof. Henry, and it was of *this* apparatus, and not of the membrane apparatus, that Prof. Henry spoke as containing "the germ of a great invention."*

Fifth. That about May 4, 1875, he made an experiment to test the transmission of an electric current through piano strings in vibration. (This experiment is fully described by Mr. Bell, in his answer 64, C. Vol. 1, pp. 130–132 and answer 362, C. Vol. 2, pp. 1610, 1611, in which latter answer Mr. Bell says, "My general impression is that we either obtained no results or indifferent results, but I can not assert this positively. My impression further is that whatever results were obtained we thought the construction of the piano not suitable for the experiments.") Watson (C. Vol. 1, p. 202) confirms the statement that the experiment was a failure.

Sixth. That on June 2, 1875, Mr. Bell *accidentally*, while experimenting for multiple or autograph telegraph purposes, with instruments that he had long had in his possession, discovered that with two multiple-telegraph instruments arranged in circuit as shown in Fig. 5 of his subsequent patent of March 7, 1876, he could, upon plucking one of the reeds with his finger, hear an audible response from the other, of the same pitch as the normal pitch of the transmitting reed, and with something of the *timbre* of that reed.

Seventh.—That thereupon Mr. Bell, for the first time in his life, conceived the *practical* possibility of transmitting articulate speech by a membrane instrument, and set about to construct one.

---

* And it was this "harp apparatus" that Mr. Bell, in March, 1875, regarded as the most important plan he had yet thought of for the electrical transmission of speech. In his letter of March 18, 1875, to his parents, he speaks of it as "the apparatus which I have designed for the transmission of the human voice by telegraph," and he does not, in that letter, mention the other alleged apparatus that the complainants would now have us believe to have been in his mind.

One was completed on July 1, 1875, and another a few days after, and, with these two instruments Mr. Bell and Mr. Watson experimented in July, and, at the end of that month, discontinued their experiments *without having heard a word of speech through the device, and even without Mr. Bell's having been able to hear a sound!*

Eighth.—That no further experiments were made till March 10, 1876, after the date of the first patent here in suit; but, on March 10, the experiments were resumed, *not with the instruments of July, 1875*, but with *a liquid transmitter* and *one of the old multiple-telegraph instruments as a receiver*, and then, for the first time was obtained, to use, Mr. Bell's words, "*intelligible articulation.*"

Reviewing these several facts, it will be noted that the alleged "harp apparatus" conception, and all that relates to it, must be laid out of consideration as utterly irrelevant and immaterial to this controversy. It is not the invention disclosed in Mr. Bell's patent of March 7, 1876, nor that of his patent of Jan. 30, 1877, but is of a different principle altogether, to wit, synthesis of sound by combining the effect of a series of armatures each having a fixed rate of vibration—a mere modification of Helmholtz's experiment.

It will also be noted that the experiment of May 4, 1875, with the piano strings, must be laid out of consideration, as it resulted unsuccessfully, and was not a telephone nor any part of a telephone nor was it intended as such. It was merely to test the correctness of something that Mr. Bell says *he had read*, viz: "that the resistance offered by a wire to the passage of an electrical current is effected by the tension of the wire"—the discovery of some prior investigator—and was done to increase Mr. Bell's stock of general electrical knowledge, of which he had confessed to Prof. Henry his great deficiency. We may, therefore, disregard all these matters as irrelevant, and confine our inquiries to the following points, viz:

First, the alleged inchoate mental conception, in the summer *or fall of 1874, of the possibility of employing a membrane apparatus for transmitting speech electrically.*

Second, the instruments made and tested in July, 1875, and the results of those tests.

Third, the accomplishment of "intelligible articulation" in the spring of 1876:—these being the only points of any materiality or pertinency to the discussion, as set forth either in Mr. Bell's sworn history, above quoted, or in the evidence submitted in this case on behalf of the complainants.

We shall discuss these three points in their order, but before entering upon such discussion it is proper to note (1) that *prior to June 2, 1875, Mr. Bell never made a telephone instrument or experiment,* his work being confined exclusively to his multiple and autograph telegraph inventions, and to his professional work as a teacher of the deaf. He testifies to this fact, in substance, throughout his deposition and sworn preliminary statements, but explicitly and pointedly in his answer to cross-interrogatory 342, C. Vol. 2, p. 1600, where he says:

> "*Cross-I. 342.*—From the summer of 1874, till at least as late as June 2, 1875, your experimental work was confined almost, if not quite, exclusively to your multiple telegraph inventions, was it not?
>
> "*Ans.*—Yes, excepting so far as my professional experiments in teaching correct articulation to deaf mutes and persons with defective speech was concerned. During the early part of the period referred to my professional experiments occupied most of my time."

In the next following answer he sets forth the different multiple telegraphs on which, during the period referred to, he applied for letters patent, and from which it appears that his attention must have been quite absorbed by the telegraph, to the exclusion of other electrical studies or work. In his letter of May 24, 1875, (C. Vol. 1, p. 132) he speaks of having given up his professional work and devoted himself exclusively to *telegraphy.* (2.) During the period prior to June 2, 1875, he was only *speculating* on the possibility of transmitting articulate speech electrically—he was not *working* on it. He seems to have repressed even his speculations on the subject in the latter part of the spring of 1875, for he says, in his letter of May 24, (C. Vol. 1, p. 133) "However, *this is kept in the background just now*, as every effort is to be made to complete the autograph arrangement, so as to have it used on some line." He was experimenting on the multiple telegraph on June 2, 1875, when he accidentally made the so-called "discovery" of that day.

Recurring now to the three material points of the discussion above referred to:—

First. The alleged inchoate mental conception, in the summer or fall of 1874, of the possibility of employing a membrane apparatus for transmitting speech.

It will be noticed that Mr. Bell, in his sworn preliminary statement (C. Exhibits, p. 1002) does not even pretend that this alleged conception was the conception of a complete apparatus, but, on the contrary, says: "I did not, at this time, devise *any method of combining a membrane with an armature*, or attempt to construct any apparatus upon the plans I had conceived." It was a mere transient speculation upon the possibility of using a membrane *somehow* in connection with an electro-magnet and an electric circuit, and was not worked out even mentally and speculatively.

It will further be noticed that, while not worked out even speculatively, it was instantly condemned by Mr. Bell himself as utterly impracticable and useless and not worth even a test or an experiment. He admits this in his preliminary statement, (C. Exhibits, p. 1002). Again in his testimony, (C. Vol. 1. 1, p. 121) where he says:—

"*Int. 42.* Did you, at that time, construct the apparatus described in your fortieth answer?

"*Ans.* I did not.

"*Int. 43.* Why not?

"*Ans.* Because I had the idea that the magneto-electric currents produced by the operation of the voice would be too feeble to produce practically useful results."

Again in his testimony, C. Vol. 2, top of page 1591: "As I have already explained, I had had the idea since the summer of 1874, that vibrations produced in this way would be of very slight amplitude, and that they might not prove sufficiently violent to produce audible effects that would prove practically useful, either for the purpose of the reproduction of articulate speech, or for the purposes of multiple telegraphy. The experiments described above (those of June 2, 1875,) convinced me that this was a mistake."

Again, referring to the same matter in his answer to cross-question 293, C. Vol. 2, p. 1577, he testifies as follows:—

"The chief doubt in my mind at that time was as to the practical value of the reproduced speech. I saw that while the reproduction of the original vibrations would, theoretically, be perfect, they would be copied in miniature—they would be, as it were, microscopic photographs of the originals. While we may not be able to see all the details of a microscopic photograph, we may be firmly convinced that they are all there, and that we have only to enlarge them in order to render them appreciable by the eye. In a similar manner, I was firmly convinced, in the summer of 1874, that articulate speech would be reproduced by the apparatus I had devised, but *I was doubtful whether the unassisted ear could perceive the vibrations as sound*, and *whether, if so, the minute details of the vibrations*, upon which depend the character or quality of the sounds produced, would be perceived by the sense of hearing."

In other words, he did not have the idea for a moment, that the slightest audible effects would be produced by his imaginary apparatus, and so he never gave the matter any further attention.

To realize how strong was his utter disbelief in the feasibility of the "plan," we have only to look at his situation, the means which he had at hand for testing the question as to whether audible effects would be produced by such an apparatus or not. The ease with which the experiment could be made—absolutely without cost—and the importance of making such test; gathering these facts from his own testimony, where they were wrung out of him on cross-examination; and it will be interesting to note how reluctantly he testifies, and how he endeavors to color the facts even to the extent of palpable misrepresentation, in order to avoid the force of the legal conclusions necessarily resulting from them. All this will be found in C. Vol. 2, pp. 1594 to 1608, answers 324 to 350. In answer 341, p. 1600, he admits that, for the purposes of reproducing articulate speech by electrical means, it was of great importance to have determined whether audible effects would or would not be produced through an electric circuit by vibrating a permanent magnet or inductive plate (armature) in front of an electro-magnet.

Here, then, was a powerful *motive*, constantly present, urging him on to make the experiment if his mind was in any *doubt* about the result.

Then he admits, in answer 330, 1595, that all the while he had in his possession the *instrumentalities* requisite for making the experiment. He had them in his possession from as early as November, 1873. This admission he repeats near the top of p. 1606, where he says: " It did not occur to me to try the experiments referred to in the question, *although I had the means at hand*, until the discovery of June 2, redirected my attention to the point inquired about."

" Redirected !" His mind had left the idea entirely, long before June 2, and had to be " redirected " to it.

Thus having from his own evidence established the facts that, if he was harboring his alleged conception at all between the summer of 1874 and June 2, 1875, and had even the slightest suspicion of its possessing any utility, he was under the influence of a most powerful motive to test the question, and had the means right at his hand for making the test at any time within those six or eight months, we summed the whole situation up in one question—cross-question 344, C. Vol. 2, pp. 1600, 1601—as follows: " *Cross-Q.* 344. Then the doubt which you speak of in your 340th answer was so strong and the hope so weak, that although the generation of undulatory currents in a circuit by the inductive energy of a vibrating magnet or plate in front of the pole of an electro-magnet suggested itself to your mind as early as July, 1874; and although for the purpose of reproducing articulate speech by electrical means it was of the greatest importance to determine whether electric undulations so caused in the line would produce sonorous vibrations at the receiving end or not; and, although you had in your possession all the instrumentalities necessary for the demonstration of that question; and, although having those instrumentalities the experiment was an exceedingly easy one to make; yet, from July, 1874, till June 2, 1875, you never made the experiment nor attempted to make it, nor attempted to ascertain whether your doubt was well founded or not, and the experiment of June 2, 1875, which finally resolved your doubt, was an experiment relating to the multiple telegraph, in which the resolving of your doubt was purely an accidental matter; am I correct?" *

Mr. Bell, when this interrogatory was put to him, realized the terrible force of the fact which it presented, and, although his reply occupies only five and one half printed pages, of which one page is mere quotation, yet it took him *twenty four hours* to complete it. It is a labored attempt at an apology; a plea that from July, 1874, to June 2, 1875, he was so driven with his professional work and his multiple telegraph inventions, that he had not the *time*, and so destitute that he had not the *money*, to make the experiment. The whole answer can be condensed into ten words;—"I was too busy and too poor to do it." And yet this was not true—he was neither too busy nor too poor, for having the instrumentalities already in his possession, he could, at any time in those eight or ten months, have made the experiment *in three minutes without the outlay of one penny of money!* These facts he is obliged to admit in the next three answers immediately following his labored apology, (answers, 345, 346, and 347, p. 1607,) and they completely destroy the whole attempted structure of excuse.

In the course of this labored but abortive attempt at excuse, how adoritly he weaves in the insinuation that he could not use the time and money of Messrs. Hubbard and Saunders for making said experiment, because he "was in honor pledged to" them to devote all his "spare time and thoughts to the development of multiple telegraphy" (p. 1601); he "felt it" his "duty to devote all" his "spare time and thoughts to the development of multiple telegraphy" (p. 1603); and (p. 1606); he "considered" his "legitimate work to be the development of multiple telegraphy"! *Now this excusatory insinuation is simply intended to mislead, and is not true in fact.*

---

* Every statement of this interrogatory is absolutely true, on the complainants' evidence, and had been established by that evidence before we put this 344th cross-interrogatory to Mr. Bell. *He does not deny* any one of these statements, but, on the contrary, tacitly admits and tries to apologize for his inaction.

The experiment in question was equally as important for the multiple telegraph as for the telephone. *The idea was originally conceived for the multiple telegraph.* He tells us, C. Vol. 1, pp. 116, 117, that he first conceived, but never made, an imaginary apparatus for multiple telegraph purposes, which he illustrates by Fig. 7, p. 117; also (pp. 118, 119,) that the imaginary harp apparatus, illustrated in Fig. 8, p. 118, referring to which he says (C. Exhibits, p. 1002), "which I had devised with special reference to multiple telegraphy," followed the conception shown in Fig. 7, p. 117, and, elsewhere, that the imaginary membrane apparatus conception of 1874 grew out of the equally imaginary "harp" conception. All three of these inchoate conceptions (including that of Fig. 7, p. 117, which is an organ reed set in an enclosing frame and capable of *very powerful vibrations* by means of air currents produced mechanically, as in an organ), he at once condemned for one and the same reason, to wit, because they would none of them give currents sufficiently strong to produce appreciable or audible results. To discover that they *would* give currents strong enough to produce such results was, therefore, equally as important for his multiple telegraph inventions as for his alledged telephone investigations, and if he was "in honor pledged" to develope the multiple telegraph, he was thereby in honor pledged to make some experiments to settle this question, and, if necessary, to use the time and money of Messrs. Hubbard and Sanders for the purpose; yet he never did it, nor attempted to do it, till June 2, 1875, simply because he had discarded and abandoned the whole idea as chimerical and worthless.

That he did abandon all three of the said alleged "plans," to wit, that illustrated in his fig. 7, p. 117, that illustrated in his fig. 8, p. 118, and the membrane plan, for one and the same reason, viz., their supposed impracticability, appears from the following:—The plan shown in Fig. 7, p. 117, is the same plan shown in Fig. 15 of drawings attached to his preliminary statement in the harmonic telegraph interference, C. Exhibits, p. 994; and the "harp" plan shown in Fig. 8, p. 118, is the same plan shown in Fig. 16 of said drawings, C. Exhibits, p. 995. Referring to these two plans, both devised "with special reference to multiple telegraphy," he specifically admits that he abandoned them, in his said preliminary statement, C. Exhibits, p. 996, where his language is as follows:—

"Fearing that ridicule would be attached to the idea of transmitting vocal sounds telephonically, especially by those who were unacquainted with Helmholtz' experiments, I said little or nothing of this plan."—(the 'harp' plan). "Indeed, reflection *convinced* me that, however feasible the scheme looked upon paper *it was impracticable*, as the induced currents would be far too feeble to overcome any great resistance. *For the same reason the plan shown in Fig. 15*" (the plan of Fig. 7, page 117, C. Vol. 1), "*seemed impracticable save in theory;* and *I began to look about for some other method* of inducing alternate positive and negative impulses which should succeed each other at equal intervals of time; and at last hit upon the plan of making and breaking contact by means of a revolving cylinder, as shown in Fig. 17.

Again, in his other preliminary statement, viz., that of the telephone interference, (C. Exhibits, p. 997) he substantially repeats the statement. Commencing with the words, "In developing my plan of multiple telegraphy" (near the bottom of p. 998) he occupies nearly a page in explaining the conception shown in Fig. 7 of C. Vol. 1. p. 117. Then, beginning with the words, "I then conceived the plan of attaching a number of springs," (near the bottom of p. 999) he describes the "harp" conception shown in Fig. 8, C. Vol. 1, p. 118, and, (from the middle of p. 1000 to the middle of p. 1001) explains how, after he had conceived this plan for multiple telegraph purposes, it occurred to him that by increasing the number of springs or armatures so as to comprehend the whole scale of musical sounds audible to the human ear, the apparatus might possibly reproduce consonantal sounds as well as the vowel sounds of Helmholtz. Then, in concluding the matter of these "plans," (p. 1002) he admits again that he considered them impracticable, for the reason above stated, and says: "I *therefore* turned my attention to *other modes of working out my plan of multiple telegraphy*, which I was thoroughly bent upon reducing to practice immediately."

His pretense, in cross-answer 344, that he did not make any experiment to test the matter until it was accidentally done on June 2, 1875, because he was "in honor pledged to" Messrs. Hubbard and Sanders not to use their time and money except for multiple telegraph matters, is therefore a sham. The question to be determined pertained directly and particularly to multiple telegraph matters, and both of the "plans," Fig. 7, p. 117, and Fig. 8, p. 118, C. Vol. 1, which he abandoned without making a model, drawing, or experiment, by reason of his utter disbelief in their producing an audible sound, were plans admitted to have been "devised" by him "for multiple telegraph purposes."

Moreover, to still further expose this shallow pretense that his obligation to Messrs. Hubbard and Sanders to complete the multiple telegraph inventions prevented his making any effort to determine the question above referred to, look at his acts on June 2, 1875, and for two months thereafter. The crucial experiment which he had refused to make because "convinced" that it would be useless, had been made at last, by mere accident. From that moment, did he have any scruples about following it up by the use of Messrs. Hubbard and Sanders' time and money? Not at all. He set Watson immediately at work, in their time and with their money, to make and experiment with instruments with which to endeavor to get articulate speech.

"*Cross-Q. 372.* Who paid the expense of having the instruments and experiments made between the 2d of June and the end of July, 1875, referred to in your examination-in-chief, interrogatories, 74–93?

Ans. Mr. Hubbard and Mr. Sanders."

(Bell, C. Vol. 2, p. 1614.)

When he applied for his patent of March 7, 1876, which he now says is for the speaking telephone, he had no scruples about burdening the same gentlemen with the expense o procuring it.

"*Cross-Q. 442.* Who paid the expense of procuring your patent of March 7, 1876?

"*Ans.* I do not know; I presume *Mr. Sanders and Mr. Hubbard.*"

(Bell, C. Vol. 2, p. 1643.)

And he says, (2d p. 1613, Ans. 371) "My understanding *always* was that the speaking telephone was included in the inventions that belonged to Messrs. Hubbard and Sanders from the autumn of 1874."

In addition to all this, let it be always remembered that the experiment *required neither time nor money,* as he is obliged to admit on p. 1607.

Still further, in his answer 344 he gives the court to understand that his obligation to Messrs. Hubbard and Sanders prevented him from using the time to make this very important experiment; *but it appears that he found time to make other experiments* which *he says* had relation to the transmission of sound or speech. He found time, in March, 1875, to spend a portion of two days with Prof. Henry, in Washington, and to explain the empty coil experiment (which he says was new and surprising to Prof. Henry, but which was an old experiment of De la Rives (see Ans. 248, C. Vol. 1, p. 194); and he found time, in May, 1875, to make the piano-string experiment (C. Vol. 1, p. 130, 131, &c.), to ascertain whether something which he had read was correct or not—each of these experiments requiring much more time and involving much more trouble than the accidental experiment of June 2, 1875.

It is, therefore, not to be believed that he neglected this great and convincing electrical experiment from the summer of 1874, till June 2, 1875, simply because he had not the time or money to make it and did not feel at liberty to use Messrs. Hubbard and Sanders' time for the purpose.

The pretense is "too thin" for credibility, and is too thoroughly contradicted by his own acts and circumstances at the time.

Again, and lastly, even admitting, for the purpose of the argument, that Mr. Bell did have, in 1874, a crude and inchoate conception of a membrane and reed armature in connection with an electro-magnet, it is altogether probable that this conception, like those of Fig. 7, p. 117, and Fig. 8, 118, C. Vol. 1, was for multiple telegraph purposes. Facts sustaining this theory are as follows:

1. Bell did, in the fall of 1874, contemplate *some kind of a stretched membrane armature* for his multiple telegraph, and mentioned it in his caveat prepared for filing that fall. This caveat is referred to in his testimony, C. Vol. 2, p. 1602, and p. 1656, Ans 490, where it was offered in evidence. It is found in C. Exhibits, pp. 857 to 868. By reference to it, C. Exhibits, p. 858, it will be seen that it described his proposed multiple telegraph transmitting instruments as follows:

"These consist of *devices for opening and closing the electrical circuit a definite number of times per second.* This may be accomplished by the employment of *vibrating armatures* (consisting of metallic plates or rods, wires, *stretched membranes*, tuning-forks, &c.) revolving cylinders, stringed or wind musical instruments, or by the use of other contrivances. The intermittent current may also be induced upon the line-wire by means of a *permanent magnet* in place of a battery. And, in the same caveat. (Id. p. 862.) "The said *armatures* may be made of any material or materials whatever, so long as they are capable of being set in vibration *by electro magnets.* They may consist of tuning-forks, rods, plates, strings or *membranes*, or may take any form capable of *definite* vibration." It will be observed that the description, C. Exhibits, p. 858, makes the proposed *stretched membrane* do duty as *one form of vibrating armature*, and in the plainest terms distinguishes it from "stringed or wind musical instruments, which are not catalogued as a form of vibrating armature, but, on the other hand, as a distinct *alternative or substitute* for all forms of armature as well as for "revolving cylinders."

This "stretched membrane" "armature" "capable of being set in vibration by electro-magnets," for multiple telegraph purposes was, therefore, probably the thing that Mr. Bell had in mind in 1874, and which it is now sought to convert into a telephone conception.

The story that it was then thought of as a telephone conception rests upon the mere statement of Mr. Bell and Dr. Blake. Both of these witnesses are proved to be unreliable: Bell is shown to be unreliable by his answer 374, on this very subject, C. Vol. 2, p. 1614.

"Did you, prior to June 2, 1872, *contemplate* the use of a membrane in connection with the vibrating reed in your multiple telegraph instrument, *or any of them?*

"*Ans: I don't think so.* I had in view the possibility of using stretched membranes in multiple telegraph apparatus of some kind, but so far as my recollection goes I simply had the idea of utilizing some of the ordinary musical instruments in which stretched membranes are used. I of course contemplated the use of a membrane in connection with a vibrating reed similar to that in my multiple telegraph, but *not clamped so as to give it a definite pitch;* for the purposes of the speaking telephone as early as the summer of 1874. I understood your question to refer to the use of this combination in the multiple telegraph. *It was never intended for this use,* although it might be possible to make some application of this kind."

Yet the caveat, written in the fall of 1874, shows conclusively that Mr. Bell's testimony is wrong—that it *was* contemplated for multiple telegraph purposes; that the reed *was* to be "clamped so as to give it a definite pitch," "opening and closing the electrical circuit a definite number of times per second," (p. 858) and "capable of definite vibration" (p. 862); and that it was *not* one of the applications of stringed instruments, but the application of a "vibrating armature" as distinguished from the other alternative ideas of the stringed instruments and the revolving cylinders. Mr. Bell's testimony is, therefore, contradicted by his own caveat, as to the contemplated use of this alleged membrane conception of 1874.

And it is contradicted by his sworn preliminary statement made in 1878 in the Telephone Interference, C. Exhibits, p. 1002. He there states under oath, "I did not, at this time, devise any method of combining a membrane with an armature," &c., whereas, in his answer 374, C. Vol. 2, p. 1614, given in 1883, five years afterwards, he is ready to testify that he did devise such a method, and to describe even the details of the method devised—the membrane he here says, was to be combined with a vibrating reed similar to that in his multiple telegraph, and the reed was not to be clamped so as to give it a definite pitch.

These contradictions, in 1883, of facts established by his own evidence in 1874 and 1878, show that we can not rely upon his testimony as to what he did or did not conceive mentally in 1874.

As for Dr. Blake, his own deposition, carefully read, shows him to be an exceedingly "swift" witness in regard to whose statements large allowances should be made for partisan or personal bias. He is ready to swear (Ans. 50 C. Vol. 1. p. 344) that Bell expressed an opinion which Bell, himself, admits he did not entertain, to wit, that the currents generated by the vibration of an armature in front of the pole of an electro magnet would be sufficient to reproduce in a receiving reed, the same vibrations imparted to the transmitting reed. He is ready to swear that, though he is utterly unfamiliar, practically, with electrical science, (Id p. 345, Ans. 52) yet he had no doubt about the strength of such currents being sufficient for the purpose, (Id Ans. 51). He even makes the extraordinary and incredible statement that, after the interview, and as a result of it, he lost all further interest in Bell's investigations because he saw that he (Bell) had attained the result which was sought, to wit, "the transmission of articulate speech electrically" (Id p. 346, Ans. 61, 62, 65,) although Bell had not made nor attempted an experiment towards that result and did not himself believe such currents practical for any purpose whatever. He is ready to describe in detail that Bell contempleted "the attachment of a metal reed to a membrane," (Id Ans. 5, 46, 69,) although Bell says in his preliminary statement (C. exhibits, p. 1002) that he did not devise any methed of combining a membrane with an armature. He swears, (Ans. 79) that he first described the proposed instrument to Mr. Bell, then denies it in Ans. 80, then admits it in Ans. 82. Having sworn, (Ans. 61), that Bell had apparently attained the solution of the problem, and also (Ans. 51), that he, (Blake) had no doubt about the strength of electrical currents so generated, he proceeded to tell us, (Ans. 86,) that he *did* have a very important doubt about the practicability of the proposed apparatus, to wit, he "doubted if a plane membrane would reproduce with sufficient accuracy the sound waves resulting from the human voice!" And he (Ans. 56, 90) proposed a curved membrane, as, for instance, the drum membrane of the human ear or the ear of some animal, having its centre depressed below the level of its periphery. He says, in Ans. 89, that he and Bell discussed "pretty thoroughly" the reasons for preferring the curved membrane, and, in Ans. 91, that they discussed said reasons "very briefly," and in Ans. 93, that they did not discuss the reasons at all, but simply talked of the fact:

"We did not discuss the reason why, the talk was simply of the fact."

He produces four sketches, *on one sheet of paper*, all relating to *the multiple telegraph* (even if we include Fig. 4, the harp apparatus "which," Mr. Bell says (C. Exhibits p. 1002) "I had devised with special reference to multiple telegraphy," and in Ans. 49, C. Vol. 1, pp. 122, 123, "I had conceived for the transmission of vocal utterance electrically" and he states (Ans. 4 to 14, pp. 339, 340, C. Vol. 1.) that other sketches were made at the time and were subsequently given to Mr. Bell at his request—as many as three or four sheets of sketches, of which Mr. Bell sees fit to put in evidence only this one sheet—but he does not pretend that even a loose sketch of this alleged membrane apparatus was made—it was all talk, "mere words," always easily capable of misrecollection, misconstruction and misrepresentation.

He states (Ans. 7, C. Vol. 1, p. 338; Ans. 56, p. 345) that the reason why this proposed "human ear," or membrane apparatus was not made and tested was "because we did not wish to dismount the human drum membrane which we were using as a phonautograph;" Mr. Bell, however, (Id. p. 121, Ans. 43) states that the reason was "Because I had the idea that the magneto-electric currents produced by the operation of the voice would be too feeble to produce practically useful results."

Bell and Blake thus contradict each other, again and again, as to material facts, and Bell contradicts his own caveat made at the time and which proves conclusively that in October, 1874, (C. Vol. 2, p. 1602) the time of the Bell-Blake interview (C. Vol. 1, p. 335, Ans. 2, p. 343, Ans. 40) Bell was indeed contemplating the use of such a membrane and armature, *but for the purpose of making and breaking the circuit a definite number of times per second, for multiple telegraph purposes.*

At the best, it was, to use Dr. Blake's own description of it in Ans. 32, p. 341, C. Vol. 1, merely "a desultory conversation in which other points relating to acoustics were discussed;" The proofs of the alleged "conception" are conflicting and contradictory. The conception itself is uncertain and, from Bell's statement (C. Exhibits p. 1002), that he "*did not devise any method of combining a membrane with an armature,*" it was confessedly inchoate and incomplete; it was never followed up with a single experiment or test or even an attempt at one; and it was abandoned at the time as "impracticable" and useless.

And what was Mr. Bell doing from October, 1874, till June 2, 1875, so far as his hope of transmitting speech electrically was concerned? The question can be answered in his own words—not experimenting, not working, but "dreaming." "During this period it must not be supposed that I had forgotten or neglected my ideas concerning the speaking telephone. Although, as stated above, I felt it my duty to devote all my spare time and thoughts to the development of multiple telegraphy, I could not help *thinking* and *dreaming* of the speaking telephone. It was constantly in my mind." (C. Vol. 2, p. 1603).—He was asleep, so far as any development of the telephone was concerned, and it was the subject only of dreams.

The law, however, requires not sleep nor dreams, where the inventor seeks to carry the date of his invention back in point of time as against other inventors; but it requires diligence and *work*. The great chasm between the summer of 1874, and the second day of June, 1875, can not be bridged by *dreams*.

"A patentee whose patent is assailed upon the ground of want of novelty, may show, by sketches and drawings, the date of his inceptive invention, and *if he has exercised reasonable diligence* in 'perfecting and adapting' it, its protection will be carried back to such date; and in a race of diligence between rival inventors, the one who first perfects an invention and embodies it in a distinct form, is entitled to priority. * * * * Independent of this provision" (Sect. 15 of the Act of 1836) "he is entitled to priority of right to a patent who first reduces his invention to a fixed, positive form adapted to practical use."

Reeves vs. *The Keystone Bridge Co.*, 4 Fish. 462 (McKennan, J., 1877.)

Mr. Bell produces no "sketches" or "drawings," made in 1874 to represent his alleged membrane conception, and no diligence whatever—not a solitary act—between that date and June 2, 1875. On the contrary, he shows immediate *abandonment of the alleged idea*, because it was deemed by him to be impracticable.

"In considering this question of reasonable diligence, it is not sufficient to answer that he used diligence in relation to some *other* invention or machine. The question is, Did he use diligence in perfecting that invention which he has made of the feeding apparatus?"

Johnson vs. *Root*, 1 Fish, 368 (Sprague, J., 1858.)

"The date of the invention is the date of the discovery of the principle involved and the *attempt to embody that in some machine.*"

Colt vs. *Mass. Arms Co.*, 1 Fish. 120 (Woodbury, J. 1851).

Along in May, 1875, when his alleged membrane conception had been for months abandoned as worthless, Mr. Bell was working with increased energy on his multiple and autograph telegraph inventions. In his letter of May 24, 1875, to his parents, (C. Vol. 1, pp. 132—134) he uses this expression: "Since I gave up my professional work and devoted myself *exclusively to telegraphy*." He was giving little or no attention to the transmission of speech, even in his dreams. "*This is kept in the background just now*, as every effort is to be made to complete the autograph arrangement so as to have it used on some line." (Id. p. 133.)

On the well settled principles of law above stated, Mr. Bell is not entitled to carry the date of his invention back to 1874; and his alleged inchoate and confessedly incomplete speculations of that date may be dismissed from further consideration, on the ground that they are utterly immaterial and irrelevant to the question at issue.

Let us, then, turn to the second and third points under discussion.

Second. The instruments made and tested in July, 1875, and the results of those tests.

Third. The accomplishment of intelligible articulation in the spring of 1876.

The accidental discovery of June 2, 1875, was simply the discovery of an electrical fact and not of the speaking telephone, viz., that the vibration of an inductive reed in front of the pole of an electro-magnet in a circuit, will produce currents of sufficient strength on the line to vibrate audibly another similar reed, similarly arranged, at the other end of the line. (C. Vol. 2, Ans. 324, p. 1594).

This discovery was made with multiple telegraph instruments such as are shown in Figs. 5 and 6 of his patent of March 7, 1876, (C. Vol. 2, pp. 1589, 1590; C. Exhibits, 1007), and which were in substance the same as the instruments shown in Fig. 3, p. 111, C. Vol. 1, which he had had in his possession from November, 1873 (Ans. 330, p. 1595,

C. Vol. 2; Ans. 18; pp. 110, 111, C. Vol. 1), but had never knowingly combined together on one line before (C. Vol. 2, Ans. 325 to 330, pp. 1594, 1595).

Having made this "discovery," Mr. Bell (in strange forgetfulness of his obligations of "honor" to Messrs. Hubbard and Sanders), set Watson at work to construct instruments with which to test the possibility of transmitting speech. And here, again, his conflicting statements show the unreliability of his testimony. In his preliminary statement (C. Exhibits, p. 1008) he says he gave the order to Watson "on the same day or *shortly after;*" in his testimony five years later than his preliminary statement, his evolutionary memory had so developed that he is prepared to state (C. Vol. 1, 139), that the order was given "immediately upon this same 2d of June, 1875." The instrument was made soon afterwards. In his preliminary statement (C. Exhibits, p. 1008), he says: "So far as I can recollect, it was not until the 1st day of July, 1875, that we were able to get the instrument in condition for trial." In his testimony (C. Vol. 1 pp. 140, 141), he says it was during the month of June, 1875, that the experiment with it was made. The experiment was tried as soon as the first instrument was made, for he says (C. Vol. 1, pp. 140, Ans. 77): "I was anxious to try the instrument at once, and could not wait to have the duplicate receiver made; so, immediately upon its construction, I attempted to use it *with one of my harmonic receivers.*"

He thinks that at these tests a battery was used in line, because the current employed was so powerful as to frequently tear the armature from the membrane (Ans. 77, 78, C. Vol. 1, pp. 140, 141). Of the results, he says, "I do not remember definitely what the results were, excepting that I was encouraged by them to *reconstruct the instrument* with a lighter armature" (Id. Ans. 77). This reconstructed instrument was then tested in the same manner as the other had been, and the results are stated in his letter of July 1, 1875 (C. Vol. 1, p. 143) as simply enabling him to distinguish the varying *pitch* of the voice—a result long before

Colt vs. *Mass. Arms Co.*, 1 Fish. 120 (Woodbury, J. 1851).

Along in May, 1875, when his alleged membrane conception had been for months abandoned as worthless, Mr. Bell was working with increased energy on his multiple and autograph telegraph inventions. In his letter of May 24, 1875, to his parents, (C. Vol. 1, pp. 132—134) he uses this expression: "Since I gave up my professional work and devoted myself *exclusively to telegraphy*." He was giving little or no attention to the transmission of speech, even in his dreams. "*This is kept in the background just now*, as every effort is to be made to complete the autograph arrangement so as to have it used on some line." (Id. p. 133.)

On the well settled principles of law above stated, Mr. Bell is not entitled to carry the date of his invention back to 1874; and his alleged inchoate and confessedly incomplete speculations of that date may be dismissed from further consideration, on the ground that they are utterly immaterial and irrelevant to the question at issue.

Let us, then, turn to the second and third points under discussion.

Second. The instruments made and tested in July, 1875, and the results of those tests.

Third. The accomplishment of intelligible articulation in the spring of 1876.

The accidental discovery of June 2, 1875, was simply the discovery of an electrical fact and not of the speaking telephone, viz., that the vibration of an inductive reed in front of the pole of an electro-magnet in a circuit, will produce currents of sufficient strength on the line to vibrate audibly another similar reed, similarly arranged, at the other end of the line. (C. Vol. 2, Ans. 324, p. 1594).

This discovery was made with multiple telegraph instruments such as are shown in Figs. 5 and 6 of his patent of March 7, 1876, (C. Vol. 2, pp. 1589, 1590; C. Exhibits, 1007), and which were in substance the same as the instruments shown in Fig. 3, p. 111, C. Vol. 1, which he had had in his possession from November, 1873 (Ans. 330, p. 1595,

C. Vol. 2; Ans. 18; pp. 110, 111, C. Vol. 1), but had never knowingly combined together on one line before (C. Vol. 2, Ans. 325 to 330, pp. 1594, 1595).

Having made this "discovery," Mr. Bell (in strange forgetfulness of his obligations of "honor" to Messrs. Hubbard and Sanders), set Watson at work to construct instruments with which to test the possibility of transmitting speech. And here, again, his conflicting statements show the unreliability of his testimony. In his preliminary statement (C. Exhibits, p. 1008) he says he gave the order to Watson "on the same day or *shortly after;*" in his testimony five years later than his preliminary statement, his evolutionary memory had so developed that he is prepared to state (C. Vol. 1, 139), that the order was given "immediately upon this same 2d of June, 1875." The instrument was made soon afterwards. In his preliminary statement (C. Exhibits, p. 1008), he says: "So far as I can recollect, it was not until the 1st day of July, 1875, that we were able to get the instrument in condition for trial." In his testimony (C. Vol. 1 pp. 140, 141), he says it was during the month of June, 1875, that the experiment with it was made. The experiment was tried as soon as the first instrument was made, for he says (C. Vol. 1, pp. 140, Ans. 77): "I was anxious to try the instrument at once, and could not wait to have the duplicate receiver made; so, immediately upon its construction, I attempted to use it *with one of my harmonic receivers.*"

He thinks that at these tests a battery was used in line, because the current employed was so powerful as to frequently tear the armature from the membrane (Ans. 77, 78, C. Vol. 1, pp. 140, 141). Of the results, he says, "I do not remember definitely what the results were, excepting that I was encouraged by them to *reconstruct the instrument* with a lighter armature" (Id. Ans. 77). This reconstructed instrument was then tested in the same manner as the other had been, and the results are stated in his letter of July 1, 1875 (C. Vol. 1, p. 143) as simply enabling him to distinguish the varying *pitch* of the voice--a result long before that time attained by the Reis Telephone with which Mr. Bell was already familiar, and which he testifies (Ans. 435, 437, 438, p. 1642, C. Vol. 2) is not capable of transmitting articulate speech.

On July 1, 1875, Mr. Bell gave orders to Watson to construct a second instrument like that already made, and it was done within a day or two thereafter (C. Vol. 1, p. 144, Ans. 84). The two instruments were then put in line and tested, in July, 1875, one as a transmitter and the other as a receiver.

At the end of July, 1875, Mr. Bell discharged Watson, who had been in his employ since the beginning of 1875, and made no more electrical experiments till after the issue of his patent (Watson, C. Vol. 1, p. 316, Ans. 179; Bell, C. Vol. 2, p. 1581, last sentence of Ans: 296, Ans. 297; Id. p. 1666, Ans. 534). When his patent issued, the whole matter stood just where it was left at the end of July, 1875:—

> "*Cross-Q.* 283. Am I to understand you that when your patent of March 7, 1876, issued, you had attained no better results than the results which you attained in June and July, 1875? And if that is not your meaning, please explain more fully what you meant by the last part of your last answer?
>
> "*Ans. That is my meaning.* (Bell, C. Vol. 2, p. 1575, Ans. 283.)"

Now, then, as the first membrane instrument was "not in condition for trial till the first day of July, 1875," and as the second membrane instrument was not made till a few days after that, and as it took the two instruments in circuit to complete the apparatus, and as the experiments ceased at the end of July, 1875, and were not resumed until after the patent issued on March 7, 1876, and as he had never attained any better results up to the date of his patent than he attained in June and July, 1875, it is only necessary to inquire into the results of July, 1875. What were they—did he achieve the transmission and reproduction of articulate speech or not? The answer is, emphatically, *he did not.*

It is fortunate that we have, on this point, *the most abso-*

lutely conclusive record evidence, made by Mr. Bell at the time, and at various times before he was subjected to great temptation to exaggerate the facts, and while his mind was unbiased and his memory fresh; otherwise his present testimony, with his wonderful skill in coloring facts by a mere turn of expression, might mislead the Court. He *now* endeavors to have the Court understand that speech was actually heard in July, 1875:—

"*Cross-Q. 281.* When did you first succeed in getting your electric speaking telephone to transmit vocal speech so that it was heard and understood from the receiver?

"*Answer.* Somewhere about June or July, 1875. The articulation of the instrument was *not entirely intelligible at this time* (*!*), but I feel perfectly sure that many words were understood, although *I can not recall the details of any experiment made at this time when the words were fully understood.*

" *Cross-Q. 282.* Can you state the circumstances under which any experiment was made in June or July, 1875, at which *any word* was heard and understood through the instrument?

"*Answer. My recollection of these experiments is very vague,* but I remember distinctly that on one occasion I was speaking to a membrane telephone (of the form marked in this case as telephone of 1875) in the top part of Mr. Williams' factory, 109 Court street, Boston, while Mr. Thomas Watson was listening to an instrument in the workshop below. I was interrupted by the sudden appearance of Mr. Watson, who had rushed up stairs in a state of great excitement, and who declared that he had heard vocal sounds proceed from the instrument to which he had been listening, and that he could almost understand what was said. We then changed places, but I was unable to hear anything on that occasion. This inability I attributed at the time to the noise of the machinery in the workshop, and to the fact that Mr. Watson was unable to throw out his voice with sufficient force to set the membrane of his telephone into good vibration. I have a general recollection that numerous similar experiments were made during June and July, and that I, myself, obtained audible results. It is my impression that a few common words or sentences were occasionally understood, but I can not give the details of any particular experiment in which this was the case. I only remember that the results were such as to lead me to the firm conviction that the speaking-telephone was a *fait accompli.* In consequence of this I took out a patent for the speaking telephone without waiting to obtain better results.

"*Cross-Q. 283.* Am I to understand you that when your patent of March 7, 1876, issued, you had obtained no better results than the results which you attained in June and July, 1875? And if that is not your meaning, please explain more fully what you mean by the last part of your last answer.

"*Ans.* That is my meaning.

"*Cross-Q. 284.* Did Mr. Watson assist you in all your telephone experiments in June and July, 1875?

"*Ans.* He did.

"*Cross-Q. 285.* In the experiment to which you referred in answer to cross-question 282, when Mr. Watson interrupted you by rushing up and announcing that he had heard vocal sounds, he also informed you that he could not make out through the instrument what you said, did he not?

"*Ans.* He did; he said "he could almost understand what I said.

"*Cross-Q. 286.* He did not state any word that he thought he had heard, did he?

"*Ans.* I don't remember; I can not recall the experiment in any detail; I simply have the general remembrance of the excitement which he manifested, and of my disappointment at not being able to hear what he had.

"*Cross-Q. 287.* From his excitement I should judge that that experiment had produced better results than any prior experiment; is that your understanding?

"*Ans.* It may be so.

"*Cross-Q. 288.* When you exchanged places with him during that experiment you were not able to understand any words through the telephone, were you?

"*Ans.* No.

"*Cross-Q. 289.* And if I understand you correctly you were also disappointed in not being able to personally verify Mr. Watson's statement as to the result obtained. Am I correct?

"*Ans.* Yes, in regard to that experiment.

"*Cross-Q. 290.* Do you remember any other experiment which you made between that time and the issue of your patent of March 7, 1876, in operating, or attempting to operate, speaking telephones?

"*Ans.* I remember that I made a number of experiments during June and July, the details of which I have forgotten.

"*Cross-Q. 291.* Then your memory of that particular experiment, in which Mr. Watson rushed up stairs and made the announcement above referred to, is more distinct than your memory of any other experiment made after that and prior to March 6, 1876, is it?

"*Ans.* Much more distinct than any single experiment made between those dates. While I can not recall with any distinctness the details of any *particular experiment*, I do have a very clear recollection of the general results of them all. I felt convinced that I had solved the problem of the reproduction of speech by electrical means.

To say that this testimony is highly colored is, in view of the facts proved in this case, inadequate to the subject—it is essentially untrue.

It is proved by Mr. Bell's own writing at the time, that he did not get speech in 1875, and that when he ceased his experiments at the end of July, his mind was simply in this condition, to-wit: *that he had discovered a principle, namely, the undulatory magneto electric current,* which he thought would be necessarily used in a speaking telephone should such an apparatus ever be invented by anybody, but that the had not devised means for utilizing that principle on telegraph lines.

Only fourteen days after the cessation of his experiments and the discharge of Watson—while the matter was perfectly fresh in his mind—he wrote a letter to his financial backer and prospective father-in-law, Gardiner G. Hubbard, (C. Vol. 2, p. 1675) of which the following is a copy, the italics being ours:

SALEM, MASS, August 14th, 1875.

DEAR MR. HUBBARD:

"On glancing back over the line of electrical experiments, I recognize that the discovery of a *magneto electric current generated by the vibration of the armature of an electro magnet in front of one of the poles,* is the most important point yet reached. *I believe that it is the key* to still greater things. The effects produced, though slight in themselves, appear to me so great in proportion to their cause, *that I feel sure that the future will discover means of utilizing currents obtained in* *this way on actual telegraph lines.* So important does it seem to me to protect the idea that I think some steps should be taken immediately towards obtaining a *caveat*, or patent *for the use of a magneto electric current*, whether obtained in the way stated above (by the vibration of permanent magnets in front of electro magnets) or in any other way. I should wish to protect it specially as a means of transmitting simultaneously musical notes differing in *intensity* as well as in pitch. I can see clearly that *the magneto electric current* will not only permit of the actual copying of *spoken utterance*, but of the simultaneous transmission of any number of musical notes (hence messages) without confusion.

"The more I think of it the more I see that the method of making and breaking contact so many times per second, is only the *first stage* in the development of the idea.

"When we can create a pulsatory action of the current, which is the *exact equivalent* of the aerial impulses, we shall certainly obtain exactly similar results. *Any number of sounds* can travel through the same air without confusion and any number should pass along the same wire.

"It should even be possible for a number of spoken messages to traverse the same circuit simultaneously, for an attentive ear can distinguish one voice from another, although a number are speaking together.

"Don't you think it would be well to take out a *caveat* for the use of *the magneto-electric current? In its present undeveloped state*, it might be unwise to let Gray know anything about it, unless indeed, we could secure the *principle* of it in a patent."

Yours Respectfully,
A. GRAHAM BELL.

GARDINER G. HUBBARD, ESQ.,
Cambridge.

This letter is conclusive evidence that, in Mr. Bell's belief at that time, the speaking telephone had not been invented, but remained for "THE FUTURE" to discover. All he could say was, that he felt sure that the future would discover it. His language concerning its discovery is all in the future tense:

"I believe it is the key to *still greater things:* I feel sure that *the future will discover* means for utilizing currents obtained in this way on actual telegraph lines; *when we can* create a pulsatory action of the current which is the exact equivalent of aerial impulses, *we shall* certainly obtain exactly similar results; *in its present undeveloped state*, it might be unwise to let Gray know anything about it, unless indeed we could secure the *principle* of it in a patent," etc., etc. "So important does it seem to me to protect *the idea*, that I think some steps should be taken immediately *towards obtaining a caveat* or patent *for the use of a magneto electric current*," etc.

This is the language of a man who thought he had discovered an underlying principle, but had not discovered or invented the means for applying it. If he had obtained even a single word of articulate speech in his July experiments, he would have known positively that he had already invented the "means for utilizing" these currents; and how different his language concerning it would have been! How swift he would have been to proclaim the great fact to Mr. Hubbard, and to base his conclusions upon it!

But we have still more conclusive record evidence upon the point: On the 28th day of December, 1875, he had his interview with Mr. George Brown, at Toronto, Canada, for the purpose of securing his pecuniary assistance in taking out patents in England on all his electrical inventions; and, in that interview, he informed Mr. Brown of his July experiments and their results. He was, of course, under strong pressure to represent these results to Mr. Brown as favorably as possible. He drew a sketch of his July instruments exactly like Fig. 7 of his patent*, which figure is now relied upon by the complainants as showing the speaking telephone, and he wrote under it, in his own handwriting, these words:

---

* The sketches shown to Mr. Brown, December 28, 1875, and the figure 7 of Mr. Bell's patent were both mere electrical diagrams, and not actual pictures of any apparatus. Watson (C. Vol. 1, pp. 324–5. Ans. 232, 23[illegible], 240,) says they are diagrams of the instruments made in June and July, 1875. Bell confirms this in his answers 129, C. Vol. 1, p. 158; 395, C. Vol. 2, p. 1620; 494, Id. pp. 1657, 1658. He says, also, in answer 608, Id. p. 1696, that "an electrical diagram" is "a diagram that would illustrate the general electrical arrangements described in the specification, and that did not profess to be exact drawings of the apparatus, *or even to show many of the mechanical details of construction.*" In his answer 392, same page, he says such diagrams "*do not pretend to show the full construction of the apparatus they illustrate.* In his answers 259, 260, 261, C. Vol. 1, p. 198, Mr. Bell explains wherein these diagrams do not exactly represent the instruments tested in June and July, 1875, although intended as diagrams of those instruments.

"*First attempt to transmit the human voice. The varying pitch of the voice could be discriminated, but not the quality. A sort of muttering effect was perceived at the receiving end when a person talked very loudly at the other end.*"

When Mr. Bell wrote, on that day, that the varying pitch of the voice could be discriminated, "but not the quality," he wrote, in effect, that it would not transmit speech. He knew perfectly well from his studies of Helmholz's investigations that the transmission of "*quality*" meant the transmission of *speech*.

"*Cross-Q 440.* Is any telephone apparatus which will not reproduce quality capable of use as a speaking telephone?

"*Ans.*—Certainly not. (Bell C. vol. 2, p. 1643.)

"*Cross-Q 52.* And, conversely, an apparatus which would not transmit and reproduce quality could not transmit and reproduce articulate speech; is not that true?

"*Ans.* It is true, recollecting, of course, that absolute perfection in the transmission of quality is not necessary for the reproduction of speech, but that the quality must be reproduced with sufficient exactness to enable one to recognize the speech transmitted." (Cross, C. Vol. 2, p. 1731.)

The complainants' other expert, Mr. Frank L. Pope, testified as follows.

Ques. Would an apparatus which would only accomplish what Mr. Bell himself stated on the 28th of December, 1875, to be true of the apparatus then represented, be of any practical utility or use for the purposes of a speaking telephone, or for the transmission of speech?

Ans. I don't think it would. (C. Vol. 2, p. 1412, Ans. 234.)

In producing "pitch" but not "quality," Bell, up to the date of his 1876 patent, had accomplished nothing more than Reis had done years before:—

"*Cross-Q. 437.* The Reis transmitter is not capable of transmitting articulate speech, is it?

"*Ans.* Certainly not.

"*Cross-Q. 438.* What characteristic of sound do you understand the Reis Telephone to transmit and reproduce?

"*Ans.* I understand that the Reis receiver will produce a sound whose pitch or "frequency" corresponds to the frequency of the interruption of the current caused by the vibration of the Reis transmitter.

"*Cross-Q. 439.* That is, it will reproduce pitch, but not loudness or quality; is that the fact?

"*Ans.* I believe so."

(Bell, C. Vol. 2, pp. 1642, 1643.)

In fact, Bell had not, up to this time, accomplished so much as Reis had accomplished more than fourteen years previously. In his paper published in Germany in 1861 (C. Exhibits, pp. 1039 to 1045), Reis described (pp. 1043–4) how he obtained loudness as well as pitch, and on p. 1044, he says: "Hitherto it has not been possible to reproduce human speech *with a distinctness sufficient for every one. The consonants are for the most part reproduced pretty distinctly*, but the vowels as yet *not in an equal degree*." On the 7th of March, 1876, Bell had only gotten "a sort of muttering effect when a person talked very loudly at the other end;" Reis had long before gotten distinct consonted sounds and indistinct vowels sounds. Bell had gotten "varying pitch," but "not quality;" Reis had gotten varying pitch and some degree of quality. And yet, knowing all about the Reis Telephone, Bell is ready to swear (Ans. 437, C. Vol. 2, p. 1642) that Reis' telephone is *not* capable of transmitting speech, while he, Bell, had, in July, 1875, and *by means of an instrument doing far less than Reis'*, produced results "such as to lead me to the firm conviction that the speaking telephone was a *fait accompli*." (C. Vol. 2, p. 1575. Ans. 282.)

It is sufficient to say that he had done nothing of the kind and believed nothing of the kind—his experiments had been a total failure, so far as concerned the transmission of articulate speech, or the element of "quality" which distinguishes articulate speech. Fourteen days after he ceased his experiments, he wrote to Mr. Hubbard that it remained for "the future" to "discover;" nearly five months afterwards he wrote, for Mr. George Brown's information, that he had not reproduced quality nor anything else but "a sort of muttering effect."

On October 31, 1877, Mr. Bell read to the Society of Telegraph Engineers at London, England, a lecture giving the history of his invention, which is printed in full in C. Exhibits, pp. 879–910. In this lecture (pp. 899, 900) Mr. Bell described his 1875 experiments and their results and said:—

> "The results, however, were *unsatisfactory and discouraging*. My friend, Mr. Thomas A. Watson, who assisted me in this first experiment, declared that he heard *a faint sound* proceed from the telephone at his end of the circuit but *I was unable to verify his assertion*. After many experiments, attended by *the same* only partially successful results, I determined to reduce the size and weight of the spring as much as possible. For this purpose I glued a piece of clock-spring, about the size and shape of my thumb nail, firmly to the centre of the diaphragm, and had a similar instrument at the other end; we were *then* enabled *to obtain distinctly audible effects*." (C. Exhibits, p. 900.)

Now that reconstruction and reorganization of the two instruments of July, 1875, by removing the essential operative parts and substituting a piece of clock-spring glued to the centre of the diaphragm, was not done till the latter part of March, or in April, 1876, a month after his patent issued!

Watson testifies to this fact in his answers 226 to 233, inclusive, C. Vol. 1, pp. 324, 325; and Bell in his answer to cross-question 472, p. 1653, C. Vol. 2, admits the fact, saying; "My recollection agrees with his" (Watson's), and also admits the fact in his answer 180, C. Vol. 1, p. 173.

It thus appears from Bell's London lecture, coupled with the testimony of Watson and himself:

1. That they did not "obtain distinctly audible effects" with the instruments in the form in which they were tested in 1875, nor until after they had been reorganized and changed about the first of April, 1876.

2. That the results of the first tests in July, 1875, were "unsatisfactory and discouraging."

3. That all subsequent tests with these instruments, up to their reorganization in April, 1876, were "attended by *the same* only partially successful results."

4. That in all these tests, before the instruments were reorganized, Watson could hear only "*a faint sound.*"

5. *That Bell could hear not even a faint sound—in fact nothing at all.*

6. That when, on December, 28, 1875, Bell wrote, in presence of Mr. George Brown, that "a sort of muttering effect was perceived," *he wrote what he had learned from Watson, but had not been able himself to verify.*

This statement of his London Lecture, that Watson heard only a sound and he, Bell, could hear absolutely nothing, is corroborated by his sworn preliminary statement of November 20, 1878, wherein (C. Exhibits, p. 1009) he states as follows:—

"I heard nothing, but Mr. Watson soon rushed up stairs and said he could hear my voice, *but could not make out what I said.* We then changed places, but *with the same result;* he heard my *voice, but I could not hear his.*"

Even in his answer 282, C. Vol. 2, p. 1575, Mr. Bell admits that he "was unable to hear anything on that occasion."

Remembering, always, his admission in cross-answer 283 (C. Vol. 2., p. 1575) *that, until the issue of his patent, March 7, 1876, he had never attained any better results than the results obtained in July, 1875,* we see that evidence could hardly be presented more conclusive of the fact that, at least up to March 7, 1876, Mr. Bell had not attained *a speaking telephone.*

But the evidence on this point has not yet been exhausted.

Gardiner G. Hubbard, Mr. Bell's financial backer and now his father-in-law, was examined as a witness for the Bell Telephone Co. in the Dowd suit, and his deposition in that suit was introduced by the complainants in this suit and is printed with their exhibits (C. Exhibits, pp. 955 to 966). He was questioned (p 957) about Bell's letters from May 4, 1875, to September 28, 1875, and then (p. 958) the following question and answer appear :—

"*Int. 12.* State whether or not you remember, *during the period of these letters,* seeing Mr. Bell have an apparatus in which the reed was attached to a membrane, and, if so, how was the membrane to be moved or vibrated?

"*Ans.* I remember distinctly two instruments to each of which a membrane was attached, and think a reed was fastened to the membranes, but I am not certain, and that he undertook to speak to one membrane while Mr. Watson and myself was to hear at the other instrument. The instruments were so arranged that the membranes could be stretched till they were quite tight, like a small drum head. I could hear a sound *but could never distinguish any spoken words.*"

It will be remembered that Watson assisted him in *all* his alleged telephone experiments in 1875.

"*Cross Q. 284.* Did Mr. Watson assist you in all your telephone experiments in June and July, 1875?

"*Ans.* He did."

(Bell, C. Vol. 2, p. 1575):—

That Watson ceased work for him at the end of July, 1875, and Bell ceased work at the same time:

(Bell, Ans. 560, C. Vol. 2, p. 1674; Ans. 521, Id. pp. 1663-4; Ans. 563, Id. p. 1676 *et seq;* Watson C. Vol. 1, p. 316, Ans. 179):—

And that Bell made no further electric experiment till after the date of his patent:

(Bell, Ans. 297, C. Vol. 2, p. 1581).

It will therefore be seen that Watson's testimony as to when *he* first heard articulate speech through a telephone is as material and important as that of Bell himself. Watson testifies as follows:

"*I have no recollection of having understood anything that was said through the telephone prior to March 10, 1876.*"

(Ans. 146, C. Vol. 1, p. 312).

In C. Vol. 1, pp. 203, 204, Ans. 13 to 15, Watson describes the experiments of June and July, 1875, and their results, to the same effect as Bell described them in his London lecture. He says he "could hear a faint sound" and Bell could hear "nothing." In his Ans. 16, p. 204, he tells us what Bell "*expected*" to do with the discovery of June 2; and in his Ans. 17, same page, he tells us what Bell was "confident" he could do if he could only "ultilize" that discovery.

This last Ans. should be read in connection with Bell's letter to Hubbard of August 14, 1875, C. Vol. 2 p. 1675.

Bell, Hubbard and Watson are the three men, of all living, who were in a position to know what results were or were not obtained through those instruments of 1875. Bell admits, in his letter of August 14, 1875, that the speaking telephone was yet a thing for "the future" to "discover;" in his paper of December 28, 1875, that the instruments had not reproduced "quality" and that he, himself, had never heard even a faint sound through them; in his London lecture, that "the results were unsatisfactory and discouraging," and only "the same" results were obtained up to the time when he applied the clock spring about the first of April, 1875; in his preliminary statement of November 20, 1878, that he had not heard a sound through these instruments in 1875, nor any "intelligible articulation" through *any* instruments until March 10, 1876; and, in his testimony to the same effect Watson swears positively that he never understood a word through any telephone apparatus till March 10, 1876: and Hubbard corroborates them both.* That would seem to dispose of the question. The instruments were not preserved and are not in evidence. Some parts of them are, and an alleged copy made from memory is, but not the originals in their entirety. Mr. Bell describes the construction of these instruments (C. Vol. 2, pp. 1582 to 1587) and it appears, (p. 1583) that the armature of the one was made at first with a pivot hinge but it was subsequently removed and another and different armature, with a leather hinge, applied in its place; also (p. 1584) that the second one was made with an armature attached by a leather hinge; and (p. 1585, Ans. 302) that he is unable to produce any of the armatures that were used with either of those instruments in July, 1875, with a leather hinge, and (Id. Ans. 303) is unable to give accurately the details of the two leather-hinge armatures as to size, dimensions, weight, &c., except by mere guess-work. It also appears from his testimony, C. Vol. 2, p. 1583, that various changes were made in the mode of attaching the armatures to the centre of the diaphragm, one method being to use a cork with a metal washer, another being to use a little metal pillar in place of the cork, and that "*these improvements, however, did not meet the difficulties of the case,*" and that membranes of different thickness, and armatures of different thickness, were tried.

---

* In fact, the experiments of July, 1875, were so unsatisfactory and discouraging that they seem to have made both Mr. Bell and Mr. Watson ill. "Then came the experiments of June 2d, 1875. This was followed by *a period of great excitement* over the speaking telephone, a period of constant experiment and *sleepless nights*. During this period my mind was *also* much *worried* by domestic matters, and by pecuniary distress; and *all these things* led to a complete breakdown of my health about the end of July or the commencement of August." (Bell, C. Vol. 2. pp. 1663, 1664, Ans. 521) "About the end of July the experiments were suspended on account of the illness of Mr. Watson, and when he had recovered I was in no condition to resume work. By about the commencement of August my health had completely broken down." (Id. p. 1674, Ans. 560.)

It further appears from his answer 177, C. Vol. 1, p. 173, that prior to the issue of his patent of March 7, 1876, he never constructed or used any membrane "telephones" except the two instruments of June and July 1875; and from his answer 300, (C. Vol. 2, p. 1584) that *no other instruments like these two of July, 1875, were ever afterward constructed until the evidence in the Dowd case was taken, which was in 1879.* Any attempted reconstruction of these instruments in 1879, or since, would, of course, be mere guess-work, and would be essentially affected by the new knowledge of the requirements needed for successfully transmitting speech.

Watson testifies (C. Vol. 1, p. 328, Ans. 259) that, in reconstructing these instruments for exhibits in the suit, *he had to supply the missing parts simply from memory* and *judgment;* and (Id., Ans. 260), that *he can not swear that the reproduced instruments are exact copies of the originals* in all respects, but only the best he could do from memory, aided by the presence of the few parts which remained extant.

All such alleged reproductions, and all alleged tests made with them are, therefore, inconclusive and incompetent. It is absolutely certain that the instruments made in 1875

never transmitted and reproduced audibly a single word of articulate speech.

Bell's First Reproduction of Speech was with Gray's Transmitter.

We have observed, both from Watson's testimony (C. Vol. 1, p. 312, Ans. 146) and from Bell's preliminary statement (C. Exhibits, p. 1011), that intelligible articulation was obtained through *something*, on March 10, 1876, although not through the instruments of July, 1875, either in their original or modified form.

This part of the history is instructive and interesting, and deserves special mention.

In his preliminary statement (p. 1011) Mr. Bell says:—

"I ought to state that *I did not, before the filing of my application,"* (February 14, 1876) *"construct the devices described in my specification for varying the resistance* of a voltaic circuit as means for producing an undulatory current. *I was in Washington the first few days in March*, and *immediately on my return* I constructed an apparatus having a wire attached to a stretched membrane, dipping into a vessel containing water, forming part of a circuit, the resistance of the circuit being varied by the vibration of the membrane, which caused the wire to dip more or less deeply into the liquid."

(This was a liquid transmitter.)

"On the 10th day of March, Mr. Watson and myself tried *this apparatus as a transmitter*, using *the steel spring armature depicted in my patent as a receiver*, and obtained intelligible articulation."

Watson (C. Vol. 1, pp. 309 to 316) describes this liquid transmitter and this receiver. *The receiver*, he says, (Ans. 125) was *"a harmonic receiver,"* and, (Ans. 127) *it was precisely similar to the instrument shown at the ends of the circuit in* ***Fig.*** *5, of Bell's patent of March 7, 1876*—that is to say, *it was not one of the alleged telephone instruments of July, 1875*, but was a multiple telegraph instrument. *The transmitter* he describes in answers 125, 147, 148, 149, 150, 164, and illustrates it in answer 149 by a sketch printed on page 313, C. Vol. 1.

It thus appears that neither of the instruments tried in

March, 1876, was like the alleged membrane telephone instruments of July, 1875.

Now by reference to C. Exhibits, pp. 14 to 16 it will be seen that Bell's application for the patent of March 7, 1876, was filed on Feb. 14, 1876, and was soon afterward suspended by the examiner by reason of a *caveat* filed by another person on the same day, but two hours later. Who this caveator was, and what his caveat was for, appears in the letter of Elisha Gray to Mr. Bell, printed in C. Vol. 2, p. 1625, and in Bell's answer 491, C. Vol. 2, p. 1657; and the entire caveat (Elisha Gray's) is printed in C. Exhibits, pp. 869 to 878, with copies of the caveat drawings attached. By comparing Watson's sketch (Exhibit Watson Sketch No. 1), C. Vol. 1, p. 313, with the drawings of Gray's caveat of Feb. 14, 1876, it will be seen that *the transmitters are substantially identical!* It was Gray's liquid transmitter, then, that Mr. Bell caused to be constructed "immediately on" his "return" from Washington, in "the first few days in March," 1876, and with which he, *for the first time in his life*, "obtained intelligible articulation."

Now by reference to Bell's letter to Gray, C. Vol. 2, p. 1627, it further appears that Mr. Bell knew that this caveat *"had something to do with the vibration of a wire in water, and therefore conflicted with my* (Bell's) *patent*," and by reference to C. Vol. 1, pp. 195 to 197, it appears that Mr. Bell had been to Washington and had an interview with the Patent Office examiner, Wilber, who ordered the interference, and had carried away from that interview the impression that the conflicting point was with reference to the "vibration of the conducting wire in mercury or other liquid." (Ans. 255, C. Vol. 1, p. 197.)

The interference was dissolved on the 25th of February, 1876. (See examiner's official letter of that date, C. Exhibits, p. 16.) When Bell had the interview with the examiner, the interference "had already been dissolved." (Bell, C. Vol. 1, top of p. 196.) Bell's visit to Washington therefore was between February 25, 1876 and March 7, 1876, or, as he says, in his preliminary statement, "in the first few days in March."

It was during that short period that he learned of what Gray had been doing, and *it was in consequence of that information that he hurried back to Boston, called Watson again into his employ, and set him at work to make a liquid transmitter*—an instrument which he had never before made (See the preliminary statement C. Exhibits, p. 1011, and see, also, Watson's Ans. 152, 153, C. Vol. 1, p. 313). Watson testifies that it was with *this* transmitter that they first got speech. Bell says, in substance, in his preliminary statement, C. Exhibits, p. 1011, that it was with *this* transmitter that they first "obtained intelligible articulation;" and Watson's enthusiasm, mentioned in his 136th Ans., C. Vol. 1, p. 311, shows that the result was unprecedented and exciting.

Now, as soon as they got speech, did they leave the date simply to the uncertainties of memory? Not at all—Watson wrote down and preserved, in a memorandum book, the very words which were heard through the instrument. (See Ans. 120, C. Vol. 1, p. 309). Here is the memorandum—"March 10, 1876. *Mr. Watson, come here; I want you. How do you do? God save the Queen,* and *several other articulate sounds." They never recorded any articulate sound before that day.* (Watson, Ans. 167, C. Vol. 1, p. 314). The result produced great enthusiasm.

Yet it took "an hour or two" (Watson, Ans. 137, C. Vol. 1, p. 311) to get these fifteen words and several other articulate sounds! Watson says he can not say how much was attempted to be transmitted that was not heard, but he considers it "highly probable that many words were spoken at the transmitter that were not understood at the receiver during that experiment" of March 10, 1876. (Ans. 141, p. 311. Id.)

Again: Even this liquid transmitter required experiment and change, *after the date of Mr. Bell's patent*, in order to make it operate. It was first tried about the date of his patent, or a day or two after, and would not operate successfully. (Watson, Ans. 156, p. 314, to Ans. 175, p. 316.) Those changes were afterwards made and then it worked.

Watson does not remember what all the charges were. (Ans. 160.)

"*Cross-Int. 174.* Before these changes were tested on March 10, 1876, had you or Mr. Bell any knowledge of the striking results which they would produce, or was your knowledge of their effect gained only from the test of March 10?

"*Ans.* I hadn't the slightest knowledge myself what the effect would be of the changes, and I don't think Mr. Bell had."

"*Cross-Int. 175.* In the state of the art at that time I suppose the effect of those changes could not have been known except by actual experiment and test, could it?

"*Ans.* That is my opinion." (pp. 315, 316).

In other words, Mr. Bell, on March 7, 1876, had not the knowledge requisite to construct an operative liquid transmitter, or direct Watson how to make one, but it required further experiment, *after that time*, to enable him to acquire that knowledge; and when the changes were about to be made and tested, neither he nor Watson could predict what their result was going to be! The work which they were then doing, was manifestly the proper and ordinary work of *invention*—the invention had not, up to that time, been completed. When the complainants argue that Mr. Bell described a liquid transmitter in his patent, we answer that it is difficult to understand how Mr. Bell could have described in such "clear, full and exact terms" that a skilled mechanic could make and operate it, that which he himself did not at that time know how to make and operate.

And further: The complainant's own expert, Mr. Pope, testifies (C. Vol. 2, pp. 1424 1425, Ans. 300, 301) that when he made his report to Mr. Orton in 1877, a liquid transmitter was a thing unknown to him, although he was then familiar with Bell's patents, (Ans. 300); and that the description in Bell's patent of March 7, 1876, is not sufficient to enable a person skilled in the art to make, without further experiment, a practically operative speaking telephone transmitter on that principle. (Ans. 301.)

Let it be noted that this was a resistance telephone—*the* *magneto apparatus of July, 1875, had up to that date never operated.* A month afterward, about April 1876, they reorganized it experimentally, with the small piece of clock spring, about the size of a thumb nail, glued to the centre of the diaphragm, and then, for the first time, that too operated; and the instruments thus operated, were almost exact duplicates of Gray's caveat *receivers!*

At this test of March 10, 1876, where were the instruments of 1875? Had their results been so "unsatisfactory and discouraging" to Mr. Bell, that they were already dismantled or destroyed? If they were in existence, and Mr. Bell or Mr. Watson had the slightest confidence in their working, *why didn't they use one of them as a receiver, with the liquid transmitter?* Why take the imperfect multiple telegraph instrument as a receiver, with a membrane telephone receiver right at hand ready for use? Even after making a successful test with the harmonic receiver, why didn't they try the alleged "telephone receivers?" *They seem to have substantially abandoned the instruments of July, 1875.* Even after getting speech through other and different instruments, on March 10, 1876, they do not recur to them nor attempt to test them, nor do they ever afterwards appear. A month afterwards, they make the magneto "thumb nail" instruments, which Watson says (Ans. 230, 231, p. 325) were new instruments—not the old ones of July, 1875.

"*Cross Int. 230.* Who made that instrument and when?

"*Ans.* I think I did, just before it was tested.

"*Cross Int. 231.* It was made after March 10, 1876, was it not?

"*Ans. According to my recollection.*"

Again—

"*Cross-Int. 226.* To the best of your recollection, how long after March 10, 1876, was it that you first heard spoken words successfully transmitted over that magneto-instrument?

"*Ans.* To the best of my recollection during March or *April*, 1876."

Bell himself testifies:

"*Int. 180.* When did you first construct a membrane telephone with a piece of clockspring about the size and shape of your thumbnail, glued to the centre of the diaphragm?

"*Ans.* Shortly *after* the granting of my patent of March 7, 1876; I *think* within the month of March."

Even of these "thumb-nail" magnetos of April, 1876, Mr. Bell, in his London lecture of Oct. 31, 1877, after stating *one question and answer successfully heard through them*, to his great satisfaction and delight, said:

"*It is a mistake, however, to suppose that the articulation was by any means perfect*, and expectancy, no doubt, had a great deal to do with my recognition of the sentence; still the articulation was there, and I recognized the fact that the indistinctness was entirely due to the imperfection of the instrument." (C. Exhibit p. 901). *

It is clear, therefore, that Mr. Bell never succeeded in reproducing speech with *any* apparatus until March 10, 1876, *nor with any magneto instruments until April, 1876, and then only imperfectly*. This fact was admitted by Mr. Storrow, in his argument of the New Orleans cases in 1886, where, referring to the test of July, 1875, he said: "Which, it is claimed, *and probably truthfully*, did not amount to the intelligible transmission of articulate words." (See his printed New Orleans argument, p. 36.)

True, Mr. Bell endeavors to furnish a plausible explanation why he never heard any speech before, evidently taking his cue from his counsel in a leading question, 91, C. Vol. 1, p. 445.

"Int. 91. Was Mr. Williams' workshop a quiet place or a noisy place at the time that you tried those experiments?

"Ans. A very noisy place."

Following this manifest hint, he swears (C. Vol. 2, p. 1575) as follows:—

"We then changed places, but I was unable to hear anything on that occasion, This inability *I attributed at the*

---

* These instruments were perfected in the *fall of* 1876, up to which time their results were very poor. See memoranda of Bell's experiments printed in C. Exhibits, pp. 35 to 45; and Gray's description of Bell's Centennial Exhibition, quoted in Pope's deposition, C Vol. 2, p. 1452; and the Centennial Reports, C. Vol. 1, pp. 236, 238.

time to the noise of the machinery in the workshop, and to the fact that Mr. Watson *was unable to throw out his voice with sufficient force* to set the membrane of his telephone in good vibration."

Neither of these last statements can be credited. One of them he has, himself, flatly contradicted in his preliminary statement, (C. Exhibits, p. 1009), where he says:—

"We then changed places, but with the same result; he heard my voice, but I could not hear his. * * * I am free to say that the results were not as good as I had expected, but *I believed that the failure to obtain better results was due to the imperfect construction of the instruments, or to their parts not being properly proportioned.*"

The other of these two statements is substantially contradicted by Mr. Bell's memorandum on the sketch shown to Mr. George Brown on December 28, 1875, which states that "A sort of muttering effect was perceived at the receiving end when a person talked *very loudly* at the other end;" and also by Watson (C. Vol. 1, p. 203) who says: "*I shouted* into the membrane telephone. Mr. Bell listened at the receiver. I think he heard nothing. We changed places. *He shouted* at the telephone and I listened at the receiver. I could hear a faint sound." Bell says, in his London lecture (C. Exhibits, p. 900) "after *many* experiments attended by *the same* only partially successful results," &c. &c.

The excuse attempted in his 282d answer is, therefore, not the true explanation. It only shows how careful we must be not to accept the uncorroborated statements of Mr. Bell. In fact, it is absurd on its face. Does anybody of common sense believe that if Mr. Bell was anxiously experimenting to get articulate speech, and thought that the noise of Williams' workshop prevented him from hearing it, he would not have tried the experiment somewhere else, or in the evening when the machinery was not running? And that if he deemed Watson's voice defective, he would not have tried that of some other person? There is no pretense that his own voice was defective, but, although, he too, shouted, Watson could hear no words from him—nothing but a faint muttering effect.

PART II

We have called attention to the proved fact that Mr. Bell obtained his first reproduction of speech electrically through Gray's liquid transmitter, on March 10, 1876, a few days after he had acquired knowledge of Gray's caveat at Washington. We desire the court, in this connection, to note the following facts, viz.:

1. That Bell had never made, nor attempted to make, such a transmitter, nor any experiment in that direction, *until after he had knowledge of Gray's caveat.* (C. Vol. 1, p. 173, Ans. 177.)

2. That all of Bell's telephonic apparatus and experiments, prior to his knowledge of Gray's caveat, *were magneto-electric apparatus and experiments.*

3. That Bell's letter of August 14, 1875, shows that he had, after reviewing all his theories and experiments, settled down upon the conviction that *the magneto-electric* current was the current for *speech-transmission,* and the "current" or "principle" to be patented, and was perfectly well aware that he had not invented an *apparatus* adapted to the successful use of such current for such purpose, but believed that "the future" would "discover means of utilizing" his theoretically correct *current.*

4. That, just prior to going to Washington, about the first of March, 1876, he was again commencing to devote his energies to his *autograph telegraph.* "Few, if any, experiments relating to the autograph telegraph, or indeed to any electrical subject, were made between the end of July, 1875, and March, 1876. *At that time I was again working* at the combination of instruments necessary to put my autograph telegraph into practical operation, as Mr. Hubbard and Mr. Sanders thought that it would prove the most immediately valuable of all my inventions." (A. G. Bell, Ans. to X. Q. 534, p. 1666, C. Vol. 2).

5. That his trip to Washington *suddenly caused him to cease*

his autograph telegraph experiments, and to re-enter upon the work of telephone experiments. It also caused him, for the time being, to neglect the magno-electric current, which he had before believed to be the only current adapted to sound-copying, and to go to work experimenting with Gray's *variable-resistance current*—a different current altogether.

6. That, after getting speech through Gray's liquid transmitter, on March 10, 1876, he immediately resumed experiments with his *magneto-electric* current and apparatus for speech transmission, but reconstructed the *apparatus*, and in April, got speech through it.

7. That this reconstructed apparatus of April, 1876, was so reconstructed that it was not like his apparatus of July, 1875, *but was exactly like the receivers shown in Gray's caveat!*

The 1875 instruments of Bell are illustrated by the cut shown on p. 1012, C. Exhibits. They had a stout bar-armature extending in an inclined direction from the edge of the case or box to the center of the diaphragm, being hinged at one end to the case and attached at the other end rigidly to the centre of the diaphragm—obviously a mode of construction borrowed from the prior Scott *phonautograph*, from which it differed only in substituting an armature for the stylus of the phonautograph, and making this armature-stylus terminate at the centre of the diaphragm instead of prolonging it beyond the opposite edge of the case as in the phonautograph.

The April, 1876, *receiver suppressed this hinged armature, and substituted for it a small, round, thin plate of inductive metal shellaced to the centre of the diaphragm*—a construction exactly like that shown in the receiver of Gray's caveat. As this receiver was to be used with a magneto-electric current, the transmitter would simply be a copy of the receiver, and hence, it was duplicated for a transmitter.

Thus, immediately after knowledge of Gray's caveat, Bell went to work and made Gray's liquid *caveat-transmitter*, and then went to work and made Gray's *caveat-receiver*, and he got his *first* speech on March 10, through Gray's *transmitter* and his *second* speech in April, through a pair of Gray's *receivers*. Comment is unnecessary.

8. In May, 1876, he delivered a lecture on the telephone to the American Academy of Arts and Sciences, in which he described and exhibited his magneto-electric telephone, and also the liquid transmitter, but did not give Gray the credit due for the latter invention and its associated variable-resistance current. (See C. Exhibits, pp. 67 to 77.)

9. In June, 1876, Bell exhibited his magneto-electric telephone at a meeting of a number of eminent persons at the Centennial, where it made a great sensation. He alleges that he had a liquid transmitter present among the instruments exhibited; *but Elisha Gray, who was present, and Prof. Barker, who virtually conducted the exhibition, both deny that any such instrument was present.* (Gray, *Overland Record*, Vol. IV., p. 2911; Barker, *Additional Proofs* p. 6–35.)

10. In the meanwhile Bell was studying and experimenting to perfect the magneto-telephone, and, in the fall of 1876, about November 12 (see C. Exhibit, p. 44), it was perfected by the substitution of a *metal-plate diaphragm*, and a *permanent magnet*, instead of a battery, to polarize the electro-magnet.

11. Bell applied for a patent on this perfected invention in January, 1877, and obtained it January 30, 1877. *This is a patent for a magneto-telephone* — for a *combination of mechanical instrumentalities*, and not for a mere current-theory.

12. In this patent Bell refers to the variable-resistance transmitting *in the most careful and guarded manner*, as a transmitter which he had *described and exhibited* at the meeting of the American Academy of Sciences in May, 1876, which was true; but *not* as a transmitter which he had *invented*, which would not have been true. The apparent intention was to make the reference a means of afterward expanding his claim by construction, but to avoid swearing that he had himself invented the variable-resistance current and transmitter.

With a thorough knowledge of the above facts, the court will now be prepared to enter upon the discussion of Mr. Bell's two patents, and of the further matters affecting their scope and validity. Part II

WHAT BELL PATENTED ON MARCH 7, 1876.

His Theory of Copying Sound Electrically.

We have now seen that, on March 7, 1876, Mr. Bell had never made an operative telephone, nor obtained through his instruments an audible word, nor been able even to hear the faintest sound through them himself; but, without waiting to invent means for utilizing the electric current for speech-transmission, had determined to patent what he felt sure would prove to be the "current," theory or "principle" of the future telephone, if it ever should be discovered.

Let us now consider what this theory was.

Mr. Bell had long been familiar with the laws of sound, as explained by modern science. He knew that any sound consists of a succession of aerial waves, each of which waves is made up of one air-condensation and one air-rarefaction. He knew that the air-particles in a sound-wave move, at each condensation, *forward* from, and, at each rarefaction, *backward* towards, the exciting cause of the sound. He also knew that the amplitude of vibration of this movement determined the loudness, and the rate or number of the vibrations per second determined the pitch of the sound.

He thus saw that every sound-wave exhibits *three* essential characteristics—the air-particles must move alternately *forward and backward*, or reverse their direction of movement, or else there could be *no vibration*, and consequently, *no sound*. They must also exhibit a certain amplitude of vibration, corresponding to the loudness of the given sound, and varying if the loudness varied; and they must vibrate at a certain rate per second, corresponding to the pitch of the given sound, and varying if the pitch varied.

Of these three characteristics, *the to-and-fro movement was the most conspicuous and fundamental, because without it there could* *be no sound wave at all;* while the varying amplitude and rate were *secondary characteristics*, serving merely to determine the *nature or character* of any particular sound caused by the to-and-fro movements of the air-particles.

With this knowledge of sound, he engaged as early as 1872 in the work of trying to invent a multiple-telegraph, by which a number of telegraphic signals could be transmitted over one wire simultaneously without interfering with each other. To accomplish this it was only necessary to utilize differences of *pitch;* for, if two telegraph transmitters, A and B, were arranged to vibrate by mechanical motive-power at different but definite rates per second, and each to throw an electrical impulse upon the line at every vibration, then two telegraph receivers, A¹ and B¹, adapted to be moved by such electrical impulses and tuned to vibrate at the same rates per second as the respective transmitters would, by what musicians call "sympathetic vibration," pick out and respond to the signals of their respective transmitters: that is to say, receiver A¹ being tuned to the same pitch as transmitter A, and receiver B¹ to the same pitch as transmitter B, then receiver A¹ would respond only to the signals of transmitter A, and receiver B¹ only to the signals of transmitter B; and thus each message would be received only by the instrument intended to work with the particular transmitter employed in sending that message

While engaged upon this multiple-telegraph invention in 1872 or 1873, he read Baille's article on speech transmission by electricity, published in this country in 1872, in the work entitled "The Wonders of Electricity;" and this article both directed his attention to the possibility of electrical speech-transmission and informed him of the main scientific laws involved in such possible transmission. We get the facts from Mr. Bell's Harmonic Interference Statement, (C. Exhibits, pp. 980–981), where he says:—

"Somewhere about November, 1873, an article entitled 'The Acoustic Telegraph,' published in 'The Wonders of Electricity,' led me to substitute steel plates for tuning-forks in my telegraphic experiments. Two transmitting instruments and two receiving instruments (specimens of which are still in my possession in their original form), were made like those shown in Fig. 5. These were arranged on circuit, as shown in Fig. 6."

Baille's article, (printed in D. Add. Proofs, pp. 429–431) refers first to Helmholtz' method of reproducing articulate sounds by synthesis, and then describes what was already known to the world as Charles Bourseul's proposed method of, and apparatus for, transmitting and reproducing speech electrically, in the following language, the italics being our own:—

"This is not the place to discuss such theories, *but if we grant that there is any truth in them, we can understand that the acoustic telegraph can be invented and can transmit the living voice.* Already experiments have been made in this direction. A vibrating plate produces a sound, and according to the rapidity of the vibrations, these sounds are sharp or flat. At each of the vibrations the plate touches a small point placed in front of it, and this contact suffices to throw the current into line; when the plate ceases to vibrate and returns to its position of equilibrium, it no longer touches the metal point and the current is consequently interrupted. By this means is obtained a series of interruptions, more or less rapid, according to the sound, the current being thrown into line and interrupted once for each of the vibrations. *At the extremity of the line the current enters an electro magnet which attracts another vibrating plate of size and quality identical with the former.* Attracted and repelled very rapidly, *exactly and as rapidly in fact as the plate mentioned above,* this second plate gives forth a sound which will have the same musical value as that of the other, as the number of vibrations per second is the same in both cases," etc., etc.

In the original Bourseul article, published at Paris, August, 1854, and printed, for this court, in the pamphlet entitled "Reis pamphlet—Reis and Bourseul publications—pages 1848–1970, Overland Record," the philosophy of Bourseul is stated still more clearly, as follows:

"Suppose that a man speaks near *a movable disk, sufficiently flexible to lose none of the vibrations of the voice;* that this disk alternately makes and breaks the connection with a battery; *you may have at a distance another disk which will simultaneously execute the same vibrations.* * * * * *

However this may be, observe that sylables can only reproduce upon the sense of hearing *the vibrations of the intervening medium.* Reproduce precisely *these vibrations,* and you will reproduce precisely these syllables."

It is important to observe that Mr. Bell not only had his attention directed by the Baille article to electric speech transmission, as he admits but also that the article directed his attention specifically to the leading fact that *the voice was to act against a vibrating plate or disk at the transmitting station; that a similar plate was to be set into vibration at the receiving station by means of current-impulses traversing an electro-magnet arranged to attract and repel the plate;* and that the problem was *to reproduce in the receiving plate the same vibrations that the voice imparted to the transmitting plate.*

This information simplified Mr. Bell's work materially. But he obtained other and still more important information from Philip Reis' Lecture on the Reis Telephone, published in Germany in December, 1860, and a translation of which is printed in the pamphlet last above referred to, pp. 11–18. In Bell's preliminary statement (C. Exhibits, p. 1004) referring to an interview which he had with Prof. Henry, at the Smithsonian Institute, on March 18, 1875, Mr. Bell says:—

"I had previously seen in the Institute of Technology, in Boston, the receiving instrument of Reis' telephone; *and was acquainted with the construction of the whole apparatus by diagrams and printed descriptions,*" and in his testimony (C. Vol. 1, p. 176, Ans. 191), he describes the *Reis receiver* as known to him and *even included among the receiving instruments referred to in his telegraph application of Feb. 25, 1875.*

Referring now to Reis' lecture, we find therein described the whole scientific theory of sound-copying, and a description of a wonderfully ingenious and theoretically perfect device for transmitting and reproducing speech. The lecture shows that Reis was a profound thinker, who had reasoned out a logical theory of electrical sound transmission, and devised therefor an apparatus which is a marvel of inventive ingenuity and scientific thought.

He describes the laws and the *composite character* of sound; *the fact that sounds can be graphically represented by curves;* exhibits and explains *the curves, and the law of their formation;* declares that "As soon, then, as it is possible to produce, *anywhere and in any manner* vibrations *whose curves shall be the same as those of any given tone or combination of tones, we shall receive the same impression as that tone or combination of tones would have produced on us;*" states that his apparatus is *constructed on that principle;* and describes his apparatus and its mode of operation.

This apparatus should be understood *precisely as Reis himself described it,* and not as Legat and others, since his day, have erroneously described it. *The only correct statement of its theory and mode of operation is to be found in the original source of evidence, Reis' own lecture of December, 1861.* As there described the voice was to ~~infringe~~ impinge upon a flexible diaphragm and set the latter into vibrations corresponding *both in rate and amplitude* to the vibrations of the air constituting the sound. By an electrical connection, the receiver was also to execute an exact copy of the transmitting vibrations, in every respect, *including both rate and amplitude.* The vibrations of the receiver, being exact copies of those of the transmitter, should reproduce the exact sounds transmitted, whether such sounds were those of articulate speech or any other sounds.

This exact correspondence of the receiving and transmitting vibrations ~~has~~ was to be obtained in the following manner, viz.:—

The transmitting diaphragm was provided with a sort of hammer-and-anvil apparatus. The anvil consisted of a thin conducting strip of platinum cemented to the diaphragm and connected to one of the binding posts in the circuit. The hammer consisted also of a thin strip of metal, connected to the other binding post and extending over the middle of the diaphragm where it terminated in a platinum pin which rested normally upon the anvil above described. When the hammer and anvil were in contact the circuit was closed; when they were not in contact the circuit was open and the current broken. The vibrations of the diaphragm under the influence of spoken or other sounds, would throw the hammer up or away from the anvil and break the circuit, and when the hammer dropped back and resumed contact, the circuit would be re-established. The louder the sound, the more violent would be the vibration of the membrane; hence, the farther would the hammer be forced away from the contact point and the longer would it take to get back again and re-establish the circuit. *Hence, each sound-wave would make one break of the line current, and the time during which this break would last would be determined by the loudness of the transmitting sound.*

Thus the current itself would possess characteristics determined by the pitch and loudness of the sound to be transmitted, to wit: the rate of its interruptions per second would be determined by the pitch of the sound and the length of each interruption would be determined by the loudness of the sound.

Let us now turn to his receiving instrument at the other end of the line. This was a coil of wire, about six inches long, through which the broken current passed on its way around the circuit. Extending through the center of this coil was a wire like a knitting needle. Each time a current-impulse traversed the coil, it would, by induction, magnetize the wire or needle at the center of the coil; and when the current was broken the needle would demagnetize. It was well known that magnetizing a wire elongates it slightly, and that when demagnetized the elasticity of the wire causes it to contract again to its normal length. Reis, therefore, saw that each current impulse that passed through the coil would elongate the needle, and each break in the current would allow the needle to contract to its normal length—hence, that the needle would be set into longitudinal vibrations, corresponding in rate per second exactly to the rate per second of the current-impulses, and therefore to the rate of the vibrations of the transmitting diaphragm and of the air which set it in motion.

But when a needle, magnetized by the induction of a passing current, is demagnetized by breaking the current the demagnetization is not instantaneous, but is completed in an appreciable time. If, therefore, the break in the current is long enough, the needle will have time to complete its demagnetization and contract back to its normal length. On the contrary, if the break is shorter than the time required to fully demagnetize the needle, the latter will not be able to contract clear back to its normal length, but, while on its way back, will be met by the next succeeding current impulse and thrown forward again by its magnetization. In other words, the length of the breaks of current will control the amplitude of vibration of the needle, such amplitude being the greater as the breaks are the longer. But the breaks are the longer just in proportion as the transmitting sound is the louder; hence, it follows that the amplitude of vibration of the receiving needle will vary as the amplitude of vibration of the transmitting diaphragm varies, or, in other words, as the loudness of the sounds to be transmitted vary; and, as we have seen, the rate of vibration of the needle, will vary as the pitch of the sound to be transmitted varies.

It follows, at least theoretically, that Reis' receiving needle will execute vibrations which are exact copies of the vibrations of the transmitting diaphragm, both in pitch and in loudness, and, therefore, that it ought to give off an exact copy of the sound spoken into the transmitter. These spoken and reproduced sounds, whether simple tones or combinations of tones, Reis declares to be *graphically representable by the same curves.* And he closes by stating that he has succeeded in transmitting and reproducing consonant sounds with this apparatus, but vowel sounds not so perfectly, and the tones of human speech not with a distinctness sufficient for every one.

All this was very important information to Mr. Bell. It not only directed his attention to the possibility of electrically copying sounds of all kinds, but it explained to him just what scientific laws and facts were involved in any possible solution of the problem. Baille and Reis both taught him to use a vibrating transmitter-diaphragm, which should take the exact movements of the sound-wave; and both taught him to use a vibrating receiver which should execute exactly the same kind of vibrations as the transmitter. Both taught him clearly and plainly that to reproduce the same vibrations in the receiver that were originally produced in the transmitter by the action of sound itself as a motive power, was to reproduce the same sound uttered into the transmitter. Both indicated to him the electric current as the connecting medium between the transmitter and the receiver. Reis pointed his attention directly to the graphic representation of sounds by curves, and to its importance in studying the question of speech-transmission. And, finally, Reis called his attention to the necessity of reproducing variations of *loudness* as well as *pitch*, and explained a *receiver* which theoretically, ought to be able to do this; and Baille and Bourseul suggested a receiver having a plate or "disk" set into vibration by an electric current traversing an electro-magnet whose poles would alternately attract and repel the plate or disk—*in substance, the receiver now in general use for telephonic purposes.*

With this very valuable information, Mr. Bell commenced to reason for himself on the great subject. Bourseul and Reis had both failed to practically achieve the desired result. There was some error somewhere, either in their theories or their instruments. Reis' theory, however, was strictly scientific and logical. Where was the error ?

Sooner or later, Mr. Bell reached the mental suspicion that their broken current was wrong, and that Reis' attempt to reproduce vibrations of varying amplitude and rate *first in the receiver instead of first in the current itself*, was wrong; and he conceived the great idea of producing *electric vibrations* on the line, and making these electric vibrations first copy, *in electricity itself*, the exact characteristics of the sound waves constituting the sounds to be transmitted. He conceived that if he could get A CURRENT *which would be an exact copy of the sound waves*, then, with any suitable receiver capable of responding to such current, he ought to get an exact copy of the sound.

As early as the fall of 1874, he says, he conceived of an apparatus which he thought ought, at least theoretically, to copy sound electrically at any distance. This apparatus, as he then mentally conceived it, was to be provided with a transmitting and a receiving diaphragm, each having an armature attached, and each armature was to be arranged in front of the polarized pole of an electro-magnet in the line; in which case, he reasoned, the vibration of one of the diaphragms and its armature, by sound waves, ought to excite induced magneto-electric currents forward and backward along the line wire, which currents ought to act through the other electro-magnet, at the distant end of the line, to vibrate its armature and connected diaphragm; and the vibrations of the receiving diaphragm, thus caused, ought to be exact copies of the vibrations of transmitting diaphragm.

But, as soon as he conceived this apparatus, he conceived also the belief that it would not operate practically to reproduce an audible sound, by reason of the exceeding feebleness of the minute currents that would be induced by such infinitesimal vibrations of the armature as would necessarily be caused by mere sound waves; and he abandoned the conception as soon as it occurred to him, and, although he had the batteries, wires, and other devices requisite for testing the question, right present to his hand, in his various multiple telegraph instruments, so that a test would not have required one minute of time, nor the outlay of one penny (see C. Vol. 2, p. 1607, Ans. 245–347); yet he never thought the plan worth even an experiment, but turned from it to dreaming of producing the desired result by Helmholtz' plan of *synthesis*. It was this latter plan (synthesis) that he described on March 18, 1875, to Prof. Henry, at the Smithsonian Institute, and which the latter pronounced "the germ of a great invention." (C. Rec., Vol. 1, p. 126.)

On June 2, 1875, while experimenting upon his multiple telegraph invention, he accidentally discovered that the induced currents caused by feeble vibrations of an armature in front of the polarized pole of an electro-magnet, were far stronger than he had believed; and at once his mind recurred to the conception of the previous fall, and he determined now to test the question. He ordered his assistant, Watson, to make him a pair of instruments for that purpose. One of these instruments was completed on July 1, 1875, and the other a few days afterward. They were tested many times in July, 1875, and failed to give him the desired sound reproduction. At the end of July he was thoroughly discouraged, discharged his assistant, and abandoned his experiments—both he and his assistant being ill, apparently from anxiety and disappointment.

Mr. Bell then went off by himself and thought over the whole line of his experiments and theories for several weeks. The result was, that he became more firmly convinced than ever that his *theory* was right, whatever failure there might have been in his *instruments;* and he wrote the letter of August 14, 1875, to Gardner G. Hubbard, in which he proposed to patent his conception of the *induced magneto-electric current,* without waiting to invent apparatus by which it could be utilized on actual telegraph lines, but leaving that for "the future" to "discover."

Soon afterwards, he set about the work of drawing up the specifications for his patent of March 7. 1876, and this work occupied him a large part of the fall of 1875. He filed the application on February 14, 1876, and the patent issued three weeks later.

Mr. Bell's theory of sound-copying electrically is set forth in this patent so clearly and fully that it can hardly be misunderstood by a careful reader.

The patent embraces two distinct and different matters or subjects of invention, viz., first, the multiple telegraph which he *had* invented and practically demonstrated by experiment, and which was, therefore, the proper subject of a patent; and secondly, his plan or proposed theory of a *current* for electrical sound copying, which he had *not* been able to demonstrate by experiment nor to embody in an operative apparatus, and which, therefore, was not the proper or lawful subject of a patent under our statutes.

There can be no misunderstanding of the patent if, while reading it, these two separate and distinct subject-matters are clearly discriminated and their essential differences kept in mind.

The patent was, primarily, for the multiple telegraph. That invention had been completed, and, moreover, Mr. Bell's financial backers believed it to be commercially valuable, while they discouraged and almost forbade his telephone experiments, because they did not believe a telephone to be of any commercial value, even if it should ever be found practicable.

But Mr. Bell, himself, believed that the telephone would be of the greater importance, if it should ever be invented, and he believed that he had correctly reasoned out the law upon which it would be found to operate. He therefore, adroitly introduced into his multiple-telegraph patent an incidental statement of his telephone theory, and carefully constructed the *fifth* claim to cover that theory.

His specification commences with a reference to his two previous multiple-telegraph inventions, which acted, in the one instance, by abrupt breaks of the current, and in the other instance, by abrupt changes of its quantity or intensity. He then points out how these two inventions had been found to successfully transmit only a limited number of signals simultaneously, because the current impulses were liable to overlap each other and form a continuous, unvaried impulse incapable of being analyzed by the tuned receivers—illustrating his explanation by the *straight* lines or dashes of figures 1, 2 and 3, of the patent drawings. He then states that by *undulating* or *gradually* varying the electric impulses on the line, this troublesome overlapping can be overcome, because the *gradually* varied impulses would be graphically represented by *curved* lines, and the curves of different signals never would neutralize each other, but, on the contrary, would only form a resultant curve which would show the elements of all its constituent curves, and which elements the tuned receivers would pick out and reproduce, so that each receiver would respond only to its own transmitter. Inasmuch as differences of *pitch* are all that is required for a multiple telegraph, while the *gradual* variation of the pitch impulses is all that is necessary to prevent them from overlapping and obscuring each other, *any* form of gradually varied or "undulatory" current would answer the purposes of the multiple telegraph. (See his Ans. 605, C. Vol. 2, p. 1695.) Hence, he describes both the induced magneto-electric current and the variable resistance current as suitable for *this* purpose, specifying many different ways of producing the required gradual variations of the current, such as vibrating a current-wire in the neighborhood of another wire, rotating a cylinder having bar magnets upon it in front of the poles of an electro-magnet, vibrating the plates of the battery in the acid, vibrating the conducting wire in mercury or some other liquid, etc., etc. And he claims his multiple-telegraph inventions, broadly, in the first four claims of the patent.

But, while describing and claiming all forms of undulatory current for his multiple-telegraph, he points out that for sound-copying or telephony, *only one of these undulatory currents*, to wit, the *induced magneto-electric form of current*, is available, because it is the only form of current capable of being thrown into *vibrations* which are *the exact electrical representatives of the air vibrations constituting sound.* It must be remembered that, on this subject, he was *merely theorizing or reasoning*, because he had never been able to demonstrate his proposition; and that his theory was that the characteristics of the air-waves must be copied and reproduced first *in the current itself*, preparatory to copying them into the motions of the receiving instrument.

We already seen that the motions of the air-particles in a sound-wave present *three* characteristics, to wit; the back-and-forth movement, without which there can be no air-wave at all ; the variations of amplitude, which control the loudness of the sound ; and the variations of rate per second, which control the the pitch of sound. Mr. Bell, reasoning that the current itself must be an exact copy of the air movements, was logically confined by his premises to a current which should exhibit these same three characteristics of form, to wit, the current must move *back and forth* like the air-particles, and its back-and-forth movements must vary in amplitude and rate. With *such* a current, there seemed no reason to doubt that any sounds or noises could be electrically copied and reproduced at any distance; *with any other current*, some one or more of the three characteristics or essential elements of the air-movements would *fail to be represented* (as was the case with Bourseul and Reis), and there was, theoretically and logically, no reason then to believe that the receiver could be made to vibrate exactly as the air vibrated at the transmitting instrument. Reis' failure had demonstrated the difficulty of attempting to translate remotely resembling current peculiarities, such as variation in the length of the breaks, into correct receiver-movements; and Bell reasoned that the current-peculiarities must *directly* and *exactly* conform to the peculiarities of the air-vibrations.

This was his theory of the possible speaking-telephone, *and it confined him to the induced magneto-electric current*, as the only current which could change polarity or direction of motion with each rapidly succeeding sound impulse.

This theory he sets forth clearly in his patent, in the following words, the italics being our own:

"When, therefore, a permanent magnet is caused to vibrate in front of the pole of an electro-magnet an undulatory current of electricity is induced in the coils of the electro-magnet, the undulations of which correspond, *in rapidity of succession*, to the vibrations of the magnet, *in polarity to the direction of its motion*, and *in intensity* to the amplitude of its vibration.

* * * * * * * *

"Electrical undulations *induced by the vibrations of a body capable of inductive action, can be represented graphically by the sinusoidal curve which expresses the vibration of the inducing body itself and the effect of its vibration upon the air*, FOR as above stated, the *rate* of oscillation in the electrical current corresponds to the rate of vibration of the inducing body—that is, *to the pitch* of the sound produced; the *intensity* of the current varies with the amplitude of the vibration—that is, with the *loudness* of the sound; and the *polarity of the current corresponds to the direction of the vibrating body*—

that is required for a multiple telegraph, while the *gradual* variation of the pitch impulses is all that is necessary to prevent them from overlapping and obscuring each other, *any* form of gradually varied or "undulatory" current would answer the purposes of the multiple telegraph. (See his Ans. 605, C. Vol. 2, p. 1695.) Hence, he describes both the induced magneto-electric current and the variable resistance current as suitable for *this* purpose, specifying many different ways of producing the required gradual variations of the current, such as vibrating a current-wire in the neighborhood of another wire, rotating a cylinder having bar magnets upon it in front of the poles of an electro-magnet, vibrating the plates of the battery in the acid, vibrating the conducting wire in mercury or some other liquid, etc., etc. And he claims his multiple-telegraph inventions, broadly, in the first four claims of the patent.

But, while describing and claiming all forms of undulatory current for his multiple-telegraph, he points out that for sound-copying or telephony, *only one of these undulatory currents*, to wit, the *induced magneto-electric form of current*, is available, because it is the only form of current capable of being thrown into *vibrations* which are *the exact electrical representatives of the air vibrations constituting sound*. It must be remembered that, on this subject, he was *merely theorizing or reasoning*, because he had never been able to demonstrate his proposition; and that his theory was that the characteristics of the air-waves must be copied and reproduced first *in the current itself*, preparatory to copying them into the motions of the receiving instrument.

We already seen that the motions of the air-particles in a sound-wave present *three* characteristics, to wit; the back-and-forth movement, without which there can be no air-wave at all ; the variations of amplitude, which control the loudness of the sound ; and the variations of rate per second, which control the the pitch of sound. Mr. Bell, reasoning that the current itself must be an exact copy of the air movements, was logically confined by his premises to a current which should exhibit these same three characteristics of form, to wit, the current must move *back and forth* like the air-particles, and its back-and-forth movements must vary in amplitude and rate. With *such* a current, there seemed no reason to doubt that any sounds or noises could be electrically copied and reproduced at any distance; *with any other current*, some one or more of the three characteristics or essential elements of the air-movements would *fail to be represented* (as was the case with Bourseul and Reis), and there was, theoretically and logically, no reason then to believe that the receiver could be made to vibrate exactly as the air vibrated at the transmitting instrument. Reis' failure had demonstrated the difficulty of attempting to translate remotely resembling current peculiarities, such as variation in the length of the breaks, into correct receiver-movements; and Bell reasoned that the current-peculiarities must *directly* and *exactly* conform to the peculiarities of the air-vibrations.

This was his theory of the possible speaking-telephone, *and it confined him to the induced magneto-electric current*, as the only current which could change polarity or direction of motion with each rapidly succeeding sound impulse.

This theory he sets forth clearly in his patent, in the following words, the italics being our own:

"When, therefore, a permanent magnet is caused to vibrate in front of the pole of an electro-magnet an undulatory current of electricity is induced in the coils of the electro-magnet, the undulations of which correspond, *in rapidity of succession*, to the vibrations of the magnet, *in polarity to the direction of its motion*, and *in intensity* to the amplitude of its vibration.

* * * * * * * *

"Electrical undulations *induced by the vibrations of a body capable of inductive action, can be represented graphically by the sinusoidal curve which expresses the vibration of the inducing body itself and the effect of its vibration upon the air*, FOR as above stated, the *rate* of oscillation in the electrical current corresponds to the rate of vibration of the inducing body—that is, *to the pitch* of the sound produced; the *intensity* of the current varies with the amplitude of the vibration—that is, with the *loudness* of the sound; and the *polarity of the current corresponds to the direction of the vibrating body*—

that is, to the *condensations and rarefactions of air produced by vibration.* HENCE, the sinusoidal curve A or B, Fig. 4, represents graphically the electrical undulations *induced* in a circuit *by the vibration of a body capable of inductive action.*

"The horizontal line *a d e f*, &c., *represents the zero of current.* The elevations *b b b*, &c., indicate impulses of *positive* electricity. The depressions *c c c*, &c., show impulses of *negative* electricity. The vertical distance *b d* or *c f*, of any portion of the curve from the zero line expresses the intensity of the *positive* or *negative* impulse at the part observed, and the horizontal distance *a a*, indicates the duration of the electrical oscillation."

It will be observed that the above extract describes the *induced magneto-electric current* as capable of being represented graphically by the same sinusoidal curves that would express the vibration of the inducing body itself, and the effect of its vibration upon the air, or in other words, that would express, as Reis had previously shown, the motions of the air-particles in a sound-wave. This assertion he confines expressly to the *induced* vibrations of a *magneto-electric current*, and he nowhere makes the same or any similar statement as to any other form of current. Indeed, he could not make it of any other form of current, for he gives the *reasons* why it can be so represented, and one of the three reasons clearly stated is that its *direction* of movement corresponds to the *direction* of movement of the air particles, that is. "to the condensations and rarefactions of air," which statement is true only of the induced *magneto-electric* current.

Then, passing to a description of Fig. 7, which is alone intended to illustrate this theory of sound-copying, he states that it is an apparatus in which the current impulses are developed by the vibration of an armature in front of the poles of an electro-magnet—that is, it is an *induction* apparatus, producing a *magneto-electric* current.

Describing how the vibrations of its transmitting armature and diaphragm, under the motive power of sound, induce undulations of electricity (magneto-electric electricity) in the line, he then says:

"These undulations are *similar in form to the air vibrations* *caused by the sound—that is, they are represented graphically by similar curves.*"

He had already described that the only undulations which *could* be represented graphically by curves similar to those of the air vibrations, were induced *magneto-electric* undulations, because, among other things, *they alone exhibit alternate reversals of polarity or direction corresponding to the alternately reversed direction of movement of the air particles.* He now explains that this is the same thing as *similarity of form.*

And, finally, he claims:

"5. The method of and apparatus for *transmitting* vocal or other sounds telegraphically, *as herein described,* by *causing electrical undulations similar in form to the vibrations of the air accompanying the said vocal or other sounds,* substantially as set forth."

Notice here, that this claim begins with "transmitting" and ends with the *undulations* on the line—it does not include the *receiver,* but only the *current* excited by a particular "apparatus" (that of Fig. 7), and exhibiting a particular kind of "undulation" on the line. In other words, it is a claim for a *current,* or *effect,* produced by a particular instrumentality.

But *what* current? He answers, in the claim itself, a current whose "undulations" are "similar *in form* to the *vibrations of the air accompanying the said vocal or other sounds.*"

When are current "undulations" thus similar *in form* to sound vibrations? He answers, on the preceding page, that *it is when they can be represented graphically by similar curves.* "These undulations are similar *in form* to the air-vibrations caused by the sound—*that is,* they are represented graphically by similar curves."

But *when* are electric undulations capable of being represented graphically by curves similar to those representing the air-vibrations? He answers this question four pages back in the printed specification, by stating that *it is when* they are *induced* (as in Fig. 7) *by the vibration of a body capable of inductive action,* giving his reasons in full for the statement, *which reasons, as we have shown, apply to no other current except the induced magneto-electric current.*

And this is his whole theory of speech-transmission, or sound copying, by electricity, as set forth in his patent of March 7, 1876. Fig. 7, of the patent was not a picture of any apparatus he had ever produced, but was only an electrical diagram designed merely to illustrate his theory. (See Bell, C. R. Vol. 2, pp. 1620, 1696, Ans. 392, 395, 608.) He had never been able to produce an operative apparatus; the whole thing was mere theory and reasoning. He was endeavoring to claim and patent *the magneto-electric current* for sound copying.

That this was his purpose, we have his own clear, positive and definite statement, in his letter to Gardiner G. Hubbard, dated August 14, 1875, after he had completed all his telephone experiments that were made prior to the date of this patent, and just before he commenced to prepare his specifications. That letter is printed in C. Rec., Vol. 2, p. 1675, and italicized in part by ourselves, is as follows:

"SALEM, MASS., August 14, 1875.

"DEAR MR. HUBBARD:

"*On glancing back over the line of electrical experiments,* I recognize that the discovery of *the magneto-electric current generated by the vibration of the armature of an electro-magnet in front of one of the poles,* is the *most important point yet reached.* I believe that it is the key to *still greater things.*

"The effects produced, though slight in themselves, appear to me so great in proportion to their cause, that I *feel sure* that *the future will discover means* of utilizing *currents obtained in this way* on actual telegraph lines.

"So important does it seem to me to *protect the idea,* that I think some steps should be taken immediately towards obtaining a *caveat or patent for the use of a magneto-electric current,* whether obtained in the way stated above (by the vibration of permanent magnets in front of electro-magnets), or in any other way. I should wish to protect it specially as a means of transmitting simultaneously musical notes differing in intensity as well as in pitch.

"I can see clearly that *the magneto-electric current* will not only permit of the actual copying of *spoken utterance,* but of the simultaneous transmission of *any* number of musical notes(hence messages) without confusion.

"The more I think over it the more I see that the method is making and breaking contact so many times per second, of only the first stage in the development of the idea.

"*When we can create* a pulsatory action of the current, which is the *exact equivalent* of the aerial impulses, we shall certainly obtain exactly similar results. Any number of sounds can travel through the same air without confusion, and any number should pass along the same wire.

"It should even be possible for a number of spoken messages to traverse the same circuit simultaneously, for an attentive ear can distinguish one voice from another, although a number are speaking together.

"Don't you think it would be well to take out a *caveat* for the use of *the magneto-electric current?*

"*In its present undeveloped state*, it might be unwise to let Gray know anything about it, unless, indeed, we could secure the *principle* of it in a patent.

"Yours respectfully,
"A. GRAHAM BELL.

"GARDNER G. HUBBARD, Esq.,
"*Cambridge.*"

The proclamation here made of his purpose to patent the "idea," "principle," or *induced* "*magneto-electric current,*" "in its present undeveloped state," without waiting to discover the "means" by which it could be usefully applied, but leaving it for "the future" to discover such means, found its exact and literal fulfillment in his patent of March 7, 1876.

It will be observed (see Bell's Ans. 560, C. Vol. 2, p. 1674) that after completing all his experiments in July, 1875, and failing to get any satisfactory or even encouraging result, ("The results were unsatisfactory and *discouraging*"—London Lecture) he took two weeks to review (or, as he says, "think and ponder over") the whole matter before writing his letter of August 14, 1875, which commences with the words, "On glancing back over the line of electrical experiments," etc., and then as the result of that review, he settled down definitively and finally upon the theory and belief that the magneto-electric current induced by the vibration of an aramature was the most important thing yet discovered, and was the "principle" that lay at the bottom of sound-transmission.

Prior to that time, he had had, on two occasions, a glimmering and transient conception that possibly other forms of current might be found available. One occasion was on May 4, 1875, when he wrote his letter about the possible effect of varying the tension of a piano-string. But he tried an experiment with Don Fenellosa's piano to determine the matter (see C. Rec. Vol. 1, pp. 134–5, Ans. 68; Vol. 2, pp. 1610, 1611), *and the experiment was a failure*, and probably served to divert his mind from any further attempts in that direction. The other occasion was on July 7, 1875, when he wrote his letter of that date: but, *as he found magneto-electric currents to be present on the line*, even when the battery current was used to polarize the electro-magnet, he settled upon the induced magneto-electric currents as the effective agent. And, upon reviewing and "pondering over" the whole line of electrical experiments, during the two weeks before writing his letter of August 14, 1875, he cast aside all other methods and currents as incompetent to fulfill the conditions necessary for producing an *electrical copy* of the three indespensable constituent elements of a sound wave, and settled down, finally and permanently, upon the induced magneto-electric current as a prime necessity. Although his experiments with this current had been "unsatisfactory and discouraging," that fact did not lead him to try any other current, so little thought had he that any other current *could* do the work required. And as for the magneto-electric current, while his *experiments* discouraged him from any further attempt to produce an apparatus for utilizing it, his *reasoning*, from his knowledge of the three essential elements of sound-waves, convinced him more and more that *this* current involved the exact principle required for the future telephone. We have only to refer to the patent itself for a clear statement of this reasoning, and, as we read it, we see beyond doubt that his premises forced him straight to the magneto-electric current, as the only current capable of fulfilling all the conditions required.

When we reflect that the whole matter lay, as yet, in reasoning and theory, we can only admire the logical accuracy of his mental conception of a current which should, in its three movement-characteristics, exactly copy the three movement-characteristics of the sound-waves, omitting none, and giving all equal prominence. Reis had reasoned accurately, but he sought to get the results only in his reciver; Bell went one step further back, and sought to get them first in the current itself, feeling sure that the future would discover the means of utilizing them if once they were there. The error of Reis lay in trying to convert remotely analogous current-impulses, into the three necessary vibrational characteristics of the receiver; the merit of Bell lies in the fact that he went *one step further back*, and sought to get the three necessary characteristics directly and exactly reproduced in the current itself, before it reached the receiver. The misfortune of Bell was, that he attempted to patent the "principle" while it was as yet a mere theory, and that the subsequent discoveries of other inventors have demonstrated the fact that it is not absolutely essential to have the *three* characteristics in the *current*, but that the characteristic of to-and-fro motion *can be safely left to the receiver*. Reis left the two characteristics of varying amplitude and to-and-fro motion to the receiver, but this was going to far. Bell sought to produce a current that left *nothing* to the receiver except to literally copy the current movements in direction, amplitude and rate; and subsequent experience has demonistrated that *such* a current, although *theoretically* the only perfect current for sound-transmission, is not the only current capable of doing the work.

But his patent, in its statement of the theory, and of the reasons therefor, and in its claim of the theoretical current, limits him strictly to the magneto-electric current—*the only current believed by him, on February 14, 1876, to be capable of the desired result.*

PART III.

WHAT BELL LEARNED FROM GRAY.

On the same day that Bell filed his application, February 14, 1876, Elisha Gray filed a caveat describing and claiming another and different current, to-wit: the variable-resistance current, for transmitting and reproducing articulate speech. An interference was declared *five days later* (Feb. 19, 1876) between this caveat and Bell's application; and, on Feb. 25, 1876, this interference was dissolved on a technicality, and Bell's application was examined and allowed on March 3, 1876, and patented March 7.

Bell, on learning of the interference, went to Washington, *arriving there, as he states, after the interference was dissolved, and being there the first few days in March* (See Bell, C. Vol. 2, p. 1,629, Ans. 404; also his preliminary statement, *ante*, p. —). Upon arriving at Washington, he had the famous interview with Examiner Wilbur, which he describes in his answers 251–256. (C. Vol. 1, pp. 195–197.) *He went* to this interview with the knowledge that the caveat interfered with the first, fourth and *fifth* claims of his application—in other words, that it was a caveat for an undulatory current of *variable-resistance* form, and was to be used for *sound-copying* by electricity. (See Declaration of Interference, C. Exhibits, p. 14.) *He came away from* this interview with the further knowledge *that the particular instrumentality which conflicted was a wire dipping in liquid*, and that the caveat liquid was *water*. "I therefore knew *that it had something to do with the vibration of a wire in a liquid. I do not now remember what it was that led me to suppose that that liquid was water.*" (Ans. 251, C. Vol. 1, p. 196.) In other words, he admits, in substance, that he obtained from the whole proceeding, the information *that the caveator proposed to copy and reproduce sound electrically by varying the resistance of a current, by means of a wire dipping in water!*

This was startling information! It is disclosed to him, in an instant, that the caveator proposed to solve the question of speech-transmission *not* by the magneto-electric current, but by *another and different current*, to wit: a current of *only one polarity*, and therefore capable of copying only two of the three characteristics of sound waves. Could *such* a current do the work? If it could, his own theory, which he was trying to patent, was wrong in one of it essential postulates. It was too important a matter to leave in doubt. He had dismissed his electrical assistant, Watson, seven months before, and had not made a telephone experiment since. His electrical work had been again resumed upon his *autograph-telegraph* (C. Vol. 2, p. 1666, Ans. 534). But everything else must now be laid aside to investigate this other mode of speech-transmission proposed by the caveator! Mr. Bell hurried back to Boston, called Watson again into his employ, and *resumed telephone experiments*, directing Watson *to made a liquid transmitter, having its wire dipping in water* (for the evidence, see *ante*, pp. ——), and with this new transmitter and current, on March 10, 1876, for the first time in his life, he heard sounds and even words and sentences, reproduced electrically. *The words, with the date, were written down in a book and laid away for future use.*

Up to this time all had been theory. Fact now took the place of theory. The information derived from Gray's caveat had changed the whole situation. Bell now, for the first time in his life, *knew* by actual demonstration *exactly* what must exist in the current in order to transmit speech; and *knew* that the magneto-electric current was not the only available form of current, and that the to-and-fro movement of the *current*, corresponding to alternate condensations and rarefactions of air, was not a necessary element. *In other words, the Gray caveat, and the experiment made in consequence of it, changed the whole theory.* By Bell's previous theory, the process consisted in using one special current, having three material ingredients of form. By Gray's theory, the process consisted in using another and different current, having only two material ingredients of form. The two processes could be carried into effect only by means of essentially different apparatus, having different modes of operation and different results. *For multiple telegraph purposes, Bell, even in his patent, had recognized the induced magneto-electric current and the variable resistance current as different inventions, by making his second and third claims to cover the one, and his fourth claim to cover the other.* But he had limited his fifth claim, for sound copying, to the former "method" or current, when excited by induction by the direct motive power of sound acting through a particular "apparatus" shown in Figure 7; and it was now too late to change the patent, for it had been issued three days prior to the dawning of the new light.

The speech obtained through Gray's transmitter on March 10, 1876, had not, however, been by any means perfect, as we infer from Watson's testimony (C. Vol. 1, pp. 309–320). Mr. Bell probably reasoned that if speech could be imperfectly reproduced by means of a current having only two of the three characteristics of the air movements, it ought to be perfectly reproduced by his ideal magneto-electric current having all three of said characteristics. Hence, he immediately resumed experiments on his own current, by having a new set of magneto instruments made and tested. These instruments were not like his unsuccessful instruments of July, 1875, but, curiously enough, are almost literal copies of Gray's caveat *receiver*. The armatures were of the size and shape of the thumb-nail, made of thin clock-spring, and cemented to the center of the diaphragms. The new instruments were completed about the first of April, 1876, and then, for the first time in his life, he heard speech *through his own current*, by means of induction instruments. These instruments did not perform as well as he believed possible; and he further improved them during the summer and fall, and patented his *telephone* on Januarary 30, 1877, no longer seeking a patent on a mere intellectual theory or "principle," but upon the mechanical combinations employed in the work.

In his London lecture, delivered in October, 1877, (C.

Exhibits pp. 879–910, and see particularly pp. 899–901). Mr. Bell gave what purported to be a history of his invention, *in which he connected his apparatus and experiments of April, 1876, directly with his experiments of July, 1875,* without mentioning the long interval that occurred between them, *and without alluding to the important and decisive intervening experiment with Gray's current and transmitter, on March 10, 1876! In his testimony in the Dowd case, in 1879, where the question of Gray's priority was directly in issue,* he was equally silent as to the March 10, 1876, experiment and demonstration. Yet that was the first occasion on which he ever heard speech electrically transmitted, and he had a record of the very words and date. How strange that he should omit to mention that great fact?/ How suggestive that there was *something there to be concealed in his own interest.* Human conduct could hardly afford stronger evidence of the fact! *Mr. Bell knows how to be silent when "silence is golden!"*

PART IV.

FOUR STARTLING REVELATIONS.

First Revelation.

We have already pointed out that, at and after the demonstration of electric speech on March 10, 1876, it was too late to amend or change the patent, which had issued three days before.

But after Mr. Bell was informed of Gray's new theory, and before he had time to determine by experiment whether Gray was right or not, it was not too late to amend the application so as to broaden its possible construction.

The new theory of Gray was not, philosophically, so perfect as that already stated in the application. Moreover, it had not been tested, and the test might prove it unsound. Whatever amendments were to be made should, therefore, be *very cautiously stated*, or they might introduce into the patent an element that, in the future, would prove undesirable.

Mr. Bell reached Washington some time between February 25 and March 1. The interference had been dissolved (on February 25) when he arrived there. (C. Vol. 2, p. 1629, Ans. 404.) He was there in the latter part of February (C. Vol. 1, p. 195, Ans. 251) and the first two or three days of March (C. Exhibits, p. 1010). The application was completed and passed for issue on March 3. (C. Exhibits, p. 31,). This gave opportunity for such an amendment while he was there, and before the application was passed for issue.

The specification, as filed on the fourteenth of February, 1876, had been written in September and October, 1875, with the greatest labor and care (see C. Vol. 1, pp. 152–158), and only completed early in January, 1876, (C. Exhibits, p. 1010). It had been "*written and rewritten a number of times*" and "*that mode of expression that seemed to me best to explain my invention, and the relation that one part of it bore* *to another,*" had been carefully chosen (Bell, C. 2, p. 1620, Ans. 394). But when the new light dawned, at the Wilbur interview, "that mode of expression" *was suddenly discovered to be inadequate,* and an amendment was filed on February 29, 1876, (C. Exhibits, pp. 16, 17) which introduced new matter, and was evidently intended to render the document more elastic. The new amendment introduced "for distinction's sake," the term "pulsatory," and made the quality of "*gradually*" increasing and decreasing the *intensity* of the current the distinguishing quality of the so-called "undulatory" current. It struck out the word "alternately" from the *fourth* claim, and substituted the new distinguishing word "gradually" in place of it; and, *for the first time,* it made the specification declare boldly that "intermittent or pulsatory and undulatory currents *may be of two kinds, accordingly as the successive impulses have all the same polarity, or are alternately positive and negative.*" It shaded off the meaning of the term "undulatory" as clearly defined before, by declaring that it is used only "in contradistinction to the terms 'intermittent' and 'pulsatory'"—*an exceedingly significant and important change af statement.* It did not, however, attempt to restate the theory of electric speech-transmission, nor to alter the statement that, *for such purpose,* the magneto-electric current, with its alternations of polarity, alone contained the necessary conditions. Such an attempt would have been too bold and hazardous to be openly made at that stage of the case; and, besides, Mr. Bell was not yet convinced that his theory of speech-transmission needed any change, nor that a change to include the new theory proposed in the caveat would be desirable even if it could be introduced.

But the sudden necessity, on February 29, 1876, of altering and adding to "that mode of expression" which had been so carefully studied out and which, *up to that time,* had "seemed to" him "best to explain" his "invention and the relation that one part of it bore to another," is strongly significant that the caveat was bearing fruits in his mind.

It is plain that the patent does not read as it would have read had Gray's caveat never been filed.

Second revelation.

But a more startling fact appears in the record, *to wit, that Pollok & Bailey, Mr. Bell's attorneys, had an underground railroad in operation between their office and Examiner Wilbur's room in the patent office, by which they were enabled to have unlawful and guilty knowledge of Gray's papers as soon as they were filed in the Patent Office!*

Let us go back a year, to the interference controversy that originated in March, 1875, between Gray and Bell, on the subject of Multiple Harmonic Telegraphs, and in which the same attorneys, Pollok & Bailey, had charge of Bell's interests. The interference was declared between March 5, 1875, and March 18, 1875. It had *not* been declared on March 5 (see Bell's letter of March 5, C. Exhibits, p. 971). It *had* been declared on March 18 (see Bell's answer 59, C. Vol. 1, p. 128, referring to his letter of that date, on pp. 125-128). This was the first interference between Bell and Gray (See Gray's cross-answer 102, on page 137 of the original Dowd Record, copied into the Molecular and Overland records).

Any authentic list of U. S. patents (such, for example, as is found in the several Official Gazettes, or in the annual lists published by the government, or in the list of Electric Patents published by the government, all of which are official government publications and matters of general history), wiil show that *Elisha Gray had no patent for any form of Multiple or Harmonic Telegraph till the 20th day of July, 1875*, and that *no patent of any kind whatever was issued to him between 12th day of November, 1872, and the 13th day of April, 1875.*

But on the 25th day of February, 1875, he had several *applications* on file in the patent office, and then pending, for his Multiple or Harmonic Telegraph inventions. One of these was filed April 18, 1874, refiled January 19, 1875, and afterwards patented July 27, 1875, No. 166.096. (See Vol.

2, of the Exhibits in the *original Dowd record*, pp. 615, 649; also patents of Gray, printed in C. Exhibits between pp. 844 and 857.). Another was filed January 19, 1875, and afterwards patented July 27, 1875, No. 166.095 (see Gray patents, C. Exhibits between pp. 844 and 857); and another *filed February 23, 1875*, for an invention whose general features are very clearly stated in Gray's subsequent patent of July 27, 1875, No. 166.094, printed in the original Dowd record, on pp. 577, 578).

These applications were, by law and the rules of the patent office, secret while pending, and no person except the officials of the patent office and Mr. Gray and his attorneys, had any right to examine them, or know their contents, *or even know of their pendency*. They were all in the custody of the electrical examiner, Mr. Z. F. Wilbur, whose duty it was to examine and act upon them officially, and to guard their secrecy.

Between the 23d and 25th days of February, 1875, Pollok & Bailey, Bell's attorneys, obtained complete knowledge of the contents of these pending applications, from which knowledge they shaped Bell's whole future course in the Harmonic Telegraph matters, and even caused him to prepare and file three new applications himself, to wit, one on February 25, 1875, one on March 6, 1875, and one on March 10, 1875! This startling information we get from a letter written by Bell to his parents on March 5, 1875, (C. Exhibits, pp. 969–972), as will appear by the following extract therefrom, commencing on p. 970:—

"In regard to the patents, my lawyers, Pollok & Bailey, found, *on examination at the patent office*, that I *had developed the idea so much further than Gray had done* that they have applied for *three distinct patents, in only one of which I come into collision with Gray*. The first patent covers the principle of 'Multiple Telegraphy,' basing my claim upon the instruments exhibited. (These instruments require *two* lines, an up line and a down line.)

"The second patent covers the principle of using an *induced current*, so as to permit a single wire to be employed.

"The third patent is for a 'vibratory circuit-breaker,' for the purpose of converting the vibratory motion of my receiving instruments into a permanent *make* or *break* of a local circuit.

* * * * *

"Another fortunate circumstance was this. That the very examiner into whose hands this will come *happened to be in Mr. Pollok's office one day when I called,* so that I had a long interview with him, in which I explained everything to him, and I can't help thinking that he must have been convinced of my independent conception of the whole thing.

"After making out our specifications and examining into the whole thing Mr. Pollok said, 'You have a good case.' The last words he said when I left were, 'You need not fear, we shall pull you through all right.'

"Whenever Gray's lawyer heard that I was in town *he applied to the patent office to complete Gray's patent, and thus force me to a law suit.*

The examiners, however, *could not act in the matter for ten days, so that gave me time to get my application in* in time. I am now waiting for the decision of the examining board. *They will probably declare an interference.* Then I shall have to have witnesses examined and prove priority.

"The invention could not have come out at any better time than the present."

And then he explains why and how their present *great importance* had come to his knowledge, to wit, through the discovery of its enormous probable effect upon the struggle then going on between the Western Union and the Pacific telegraph companies for the monopoly of rapid telegraphing. The written contract between Bell, Sanders and Hubbard, by which the latter two gentlemen were to furnish money and have an interest in Bell's inventions, was executed Feb. 27, 1875 (C. Exhibits, p. 972), two days after the first of the three applications was filed as above stated—the whole business apparently having received a sudden impulse, from its recently discovered immediate importance to the rival telegraph companies.

But what an infamous proceeding is revealed in this letter of March 5, 1875, with all its professions of honesty. The clear meaning of it is this: *On the very day that Gray filed his last application, or the next day after,* Pollok goes to the patent office, *and examines all of Gray's papers*, so that he is enabled *to determine exactly what Gray had done and to compare it with what Bell had done.* Pollok then prepares three applications for Bell, *one of which was to tie up Gray in interference, while the others were to steer clear of Gray and come out in patents before Gray could get out of the interference*—in which case Bell, and not Gray, could probably secure the patronage of the telegraph company. Gray's attorney was pressing his client's applications (Pollok and Bell had no right to know *this*), but the examiner was induced to *suspend all proceedings on Gray's matters for ten days*, which would give Bell "*time to get*" *his* "*application in in time.*" These things could not have been done by Pollok except with Wilbur's connivance, and they establish beyond all peradventure the existence of a corrupt conspiracy between Pollok and Wilbur to "work" the patent office in Bell's interest. The letter shows that it was not always necessary for Pollok to go to the patent office to consult Wilbur, for the latter was at times to be found and interviewed at Pollok's office.

Bell was asked, in his cross-examination in the People's case, (C. Vol. 2, p. 1600, Cross-Q. 343) what applications he had filed between the summer of 1874 and June 2, 1875, to which he replied:

> "*Ans.* 1. Application, *February 25, 1875.* Multiple telegraphy; circuit-breaking vibrators for transmitters and tuned reed receivers; patent not issued; *in interference with Gray.*
>
> 2. Application, *March 6, 1875.* Vibratory circuit-breaker and autograph receiver. *Patented* as No. 161,709, April 6, 1875.
>
> 3. Application, *March 10, 1875.* Multiple telegraph circuit breaking transmitters used with induction coils; *in interference with Gray;* patent not issued."

The programme was thus carried out, just as arranged by Pollok, except that, by some accident or inadvertence, *or change of plan, two* of Bell's new applications got into interference with Gray, instead of *one*, as had been originally planned. The subject-matters of these three interferences are stated by Bell in his preliminary statement in the Harmonic Interferences (C. Exhibits, pp. 990, 991). Bell knew from the "*examination at the patent office*" just how far Gray had gone, just what to do to head him off and stop him by interference, just how to steer by him without interference, just what motions Gray's attorney was making to advance his client's interests; and the fact that one of his applications, filed to head Gray off, was put into the patent office on February 25, only two days after Gray had filed the application which was to be headed off, shows that he got his knowledge *instantly upon the filing of Gray's applications.*

With a clear knowledge, now, of the corrupt relations existing between Pollok and Wilbur, our minds may well be prepared for the still more extraordinary revelations that are to follow, respecting the application of February 14, 1876, for one of the patents here in controversy.

Third revelation.

This revelation consists of indubitable evidence that an important invention and a claim therefor, were bodily interpolated into Bell's specification, between February 14, 1876, and February 19, 1876, by Pollok, in consequence of the guilty knowledge which the latter already had of the contents of Gray's caveat, before the declaration of interference with Gray on February 19th.

The interpolated claim was the *fourth* claim, which, as then formulated, read as follows:

4. "The method of producing undulations in a continuous voltaic circuit by alternately increasing and diminishing the resistance of the circuit or by alternately increasing and diminishing the power of the battery as set forth."

The interpolated new invention (admitted to be an invention *by the making of this separate claim for it*) was the passage found on the fifth page of Bell's printed specification (see copies of his two patents, printed between pp. 54 and 71, C. Vol. 1), in the following words, to-wit:

"Electrical undulations may also be caused by alternately increasing and diminishing the resistance of the circuit, or by alternately increasing and diminishing the power of the battery. The internal resistance of a battery is diminished by bringing the voltaic elements nearer together, and increased by placing them farther apart. The reciprocal vibration of the elements of a battery, therefore, occasions an undulatory action in the voltaic current. The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit, then the more deeply the conducting wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current. Hence, the vibration of the conducting wire in mercury, or other liquid included in the circuit, occasions undulations in the current. The vertical vibrations of the elements of a battery in the liquid in which they are immersed, produces an undulatory action in the current by alternately increasing and diminishing the power of the battery."

The fourth claim, it will be observed, is one of the four multiple telegraph claims, not sued upon in this suit because not relating to *sound-copying*, but only to the employment of *mechanical* motive-power to set the apparatus in operation. Mr. Bell was not convinced till March 10, 1876, that the variable-resistance current would answer for sound-copying, because it was not theoretically correct in *form*, lacking, as it does, one of the three characteristics of sound-waves. The interpolated passage was drawn to support the interpolated claim. It described a current which was clearly available for multiple telegraphing, whether it was or was not available for sound copying, because "*form*" is "*neither material nor essential*" in a current for multiple telegraphy. (Bell, Ans. 551, C. Vol. 2, p. 1672.) *Gray's caveat* had revealed this new current, and it was seen at once to be clearly available for multiple telegraph purposes, whatever other merits or demerits it might have. *It had never been experimented with by Mr. Bell.* (See his Ans. 177, C. Vol. 1, p. 173, 450; C. Vol. 2, p. 1644.) The description of it was accordingly interpolated *among the multiple telegraph apparatus, in direct sequence after the reference to the rotating cylinder having bar magnets arranged upon its periphery, and other appliances clearly not telephonic.*

How do we know it was an interpolation? Because there is in the record a copy of Mr. Bell's specification, made *before* his American application was sworn to on January 20, 1876, and which was, to wit, on or about January 25 1876, five days *after* the application sworn to, "*handed to*" Hon. George Brown, in New York City, to be taken to England, where Mr. Brown was immediately going, in order to patent the invention there; *and not one word of the interpolated matter is to be found in that copy,* but on the contrary, the positive statements of the copy are *expressly inconsistent,* both scientifically and practically, with such matter, and would not have been allowed to remain in the copy if the matter described in the interpolated passage and claim had been invented by Mr. Bell before Mr. Brown took the copy to Europe.

This copy is found printed in full in C. Exhibits, pp. 936–947. It contains all the drawings of the American patent, including Fig. 7. *It describes the magneto-electric current and appartus alone, both for the multiple telegraph and for sound-copying;* and it states, in express terms, that, although "there are many ways of producing undulatory currents of electricity," yet "*all of them* depend for effect *upon the vibration or motion of bodies capable of inductive action,*"—in other words, that *all of them are magneto-electric.* It then describes the three *magneto-electric* devices *that are described in the patent of March 7, 1876, immediately before the interpolated passage;* after which it proceeds to the description of the drawings, in utter obliviousness of the variable-resistance devices referred to in the interpolation. And, finally, it claims, *in different and alternative forms of claim,* the three *magneto-electric* multiple-telegraph inventions claimed in claims 1, 2 and 3, of the patent, and the sound-copying method and apparatus claimed in the last claim of the patent; but contains no claim in the remotest degree resembling claim 4 of the patent!

The relations of Hon. George Brown, of Toronto, Canada, (deceased before the testimony was taken in these cases) are fully set forth in Mr. Bell's preliminary statement (C. Exhibits, p. 1010), and in Mr. Bell's testimony, (C. Vol. 2, pp. 1676–1683, and p. 1700). During the fall of 1875, Mr. Bell solicited him to take an interest in his inventions and patent them in England. December 24, 1875, Bell visited him at Toronto, interviewed him on the evening of December 28th, and executed a written agreement with him on December 29th, returning to Boston about January 1, 1876. It clearly appears from his testimony (C. Vol. 2, pp. 1679–80) that he was not in Canada again during that winter. It also appears from the testimony of Gardiner G. Hubbard (C. Exhibits, p. 961, Ans. 22,) that *Mr. Brown met Mr. Bell and Mr. Hubbard, in New York City, on or about January 25, 1876,* on this business. Brown immediately proceeded to England *the last week in January*, 1876 (Bell, C. Vol. 2, p. 1682, Ans. 567–8) taking with him the copy above referred to, in order to file it for a patent there. He was to cable Bell when it was filed, but delayed to act in the matter, and Hubbard grew impatient and had the American application filed, February 14, 1876, without waiting further to hear from Brown. The copy in question was not sent by mail to Brown, but was "*handed to*" him at some time between December 29, 1875, and the time he sailed—the last part of January, 1876. (Bell, Ans. 570, C. Vol. 2, p. 1682.) Inasmuch as the interview at New York city, on or about January 25, 1876, was the only time when Brown and Bell were together between December 29, 1875, and the time of Brown's sailing, *that* must have been the occasion when the copy was "handed to" him; *and that was five days after the American specification had been sworn to.* Brown's endorsement on it shows that it was given him shortly before he left for England, (C. Ex., p. 944.) Hubbard testifies that Mr. Bell was very solicitous to have the patents "*taken out in his native country, that he might there have the benefit of what he believed to be a great invention.*" (Hubbard, C. Exhibits, p. 961, Ans. 22.)

We have, therefore, the extraordinary spectacle of Mr. Bell's handing to George Brown, on January 25, 1876, the eve of his departure to Europe, a specification of this "great invention," to be filed and patented there, which specification not only totally omitted the entire description of the variable-resistance current and the claim based upon it, but declared in express terms that *all* "ways of producing" what he then knew as "undulatory currents of electricity" "*depend for effect upon the vibration or motion of bodies capable of inductive action*," or, in other words, that the *magneto-electric* current was the only current known to him that *could* produce this effect! It is simply incredible that this specification should have been put into Mr. Brown's hands after Janury 20, 1876, if his American specification, sworn to on that day, had contained the matter which now appears in it, or Mr. Bell had even known of such new inventions.

The copy given to George Brown had been written in October, 1875. (Bell, Ans. 571, C. Vol. 2, p. 1682.) It contains some erasures and interlineations, but they were made before it was handed to him. (Bell, Ans. 576, C. Vol. 2, p. 1683.) They consist merely of restatements of matters in what was evidently deemed better phraseology.

The American specification was written mainly in September and October, 1875, but the finishing touches were put to it between January 1, 1876, and January 10, 1876. (C. Exhibits, p. 1010; Bell's Ans. 114–115, C. Vol. 1, p. 156; and Hubbard's Ans. 20, C. Exhibits, p. 960.) These finishing touches evidently consisted in correcting the phraseology substantially as it appears to have been afterwards corrected in the George Brown "copy."

The American specification was not altered in any respect between January 10, 1876, and February 14, 1876, as we know by Mr. Bell's repeated statements. It was sent to Washington by the hand of Mr. Hubbard on January 10, 1876, to be examined by Mr. Pollok. (C. Exhibits, p. 960; Bell, Ans. 114, 115. C. Vol. 1, p. 156.) *Pollok made no change in it* (Bell, Ans. 115, p. 156), but *had a fair copy made by one of his clerks*, and returned it to Mr. Bell, at Boston, on January 18, 19 or 20, 1876, and Mr. Bell made oath to it on January 20. (Bell, C. Vol. 1, p. 157, Ans. 119–122.) As soon as it was sworn to, Mr. Bell sent it to Pollok. (Bell, C. Vol. 2, p. 1680, Ans. 563.) It was deemed advisable to go over it once more together with Mr. Pollok, although it had been sworn to, and, accordingly, Pollok came to New York city with it a few days after January 20, 1876, (probably when George Brown met them there,) and a day was spent in "going over it with care," but "*no change whatever was made in it,* and Mr. Pollok took it back with him." (C. Exhibits, pp. 1010, 1011.) This is the last that appears of it till it was filed in the patent office February 14, 1876. We therefore know that it was not altered after January 10, 1876, till it was taken by Pollok back to Washington to be filed, some days after it had been sworn to and after it had received the final scrutiny of Mr. Bell and his attorney—which scrutiny was probably at the very time when the copy was handed to Mr. Brown to take to England.

The following schedule will show the whole history:

American specification written in Sept. and Oct., 1875......	(C. Exhibits, p. 1010.)
Hubbard saw it in Oct., 1875.............................	(C. Exhibits, p. 960.)
Hubbard took it to Washington to submit it to Pollok, about Dec. 1, 1875	(Id.)
and took it back to Boston, Dec. 14 or 15, 1875.........	(Id.)
The patent drawings were made between Dec. 15, 1875, and Jan. 15, 1876	(Bell, C. Vol. 2, p. 1658.)
The specification was completed early in January, 1876.....................	(C. Exhibits, p. 1010.)
And was sent to Washington, January 10, 1876	(C. Exhibits, p. 960.)
Where Pollok went over it again............	(Id.)
But did not change it...	(Bell, Ans. 115, C. Vol. 1, p. 156.)
Pollok's clerk then made a fair copy of it and the copy was sent to Bell for the oath, Jan. 18, 1876...	(Id. Ans. 119, 122.)

It was sworn to Jan. 20, 1876	(Id. Ans. 123.)
And sent to Pollok immediately......	(C. Vol. 2, Ans. 563, p. 1680–1.)
Pollok brought it to New York a few days after it was sworn to, where it was examined by him and Bell with great care for a whole day, but no change whatever was made in it...	(C. Exhibits, p. 1011.)
Brown had his "copy" handed to him between Dec. 29, 1875, and his sailing for England the last week in January, 1876	(Bell, C. Vol. 2, p. 1682.)
And shortly before he left for England............	(C. Exhibits, p. 944.)
The Brown copy was written in October, 1875...	(Bell, C. Vol. 2, p. 1682, Ans. 571.)
Its alterations were made before it was handed to him..............................	(Bell, C. Vol. 2, p. 1683, Ans. 576.)
Hubbard and Bell met Brown in New York City on this business about Jan. 25, 1876.........	(C. Exhibits, p. 961.)
Brown took the copy with him to England the last week in Jan. 1876......	(Bell, C. Vol. 2, p. 1682.)
They waited till Feb. 14, 1876, for Brown's cablegram, and then filed the application......	(Bell, Ans. 124, C. Vol. 1, p. 158.)

Any alteration of the specification between January 20, 1876, (the date of the oath,) and February 14, 1876 (the date of the filing), to include the description of this new variable resistance telegraph and the claim for it as a new invention, *would have necessitated a new oath to the application*, as, otherwise, the patent, if issued on it, would be invalid and void for non-compliance with the law requiring the inventions to be sworn to. Such alteration, if made between January 20 and February 14, would have been innocent, if the subject-matter had been Bell's invention, and would, unquestionably, have been inserted openly and above-board, and the application re-sworn to as the law required; and the testimony of Bell and his witnesses would have shown the fact and, approximately or exactly, the date. But Mr. Bell has been very careful *not* to state when this interpolated matter was inserted, nor why it was inserted, nor why it fails to appear in the George Brown copy, nor why so important an addition, both to the description and claim, was not even attempted to be patented in England, where he was so solicitous of holding both the honor and profit of his "great invention." *In his testimony the whole matter was slipped over in silence*, just as in his London lecture and his testimony in the Dowd case he slipped silently over the first electric transmission of speech on March 10, 1876, with Gray's transmitter, and tacked his April, 1876, experiments directly to his July, 1875, experiments, without alluding to the long time intervening between them or the great discovery demonstrated between them! "Silence," sometimes, "is golden," but it is not always consistent with *veracity*.

The appellees are, therefore, reduced to one of only three alternatives: They must admit that the interpolation was made *between February 14 and February 19*, which renders the patent void; or, secondly, they must admit that it was made *after the specification was sworn to*, on January 20, and before February 14, which renders the patent equally void, and is, besides, totally incredible in view of the fact that a a new oath was never made; or, finally, they must take the incredible position that Bell allowed George Brown to leave for England without copying into his paper this *all important* new matter (which could easily have been inserted in five minutes) although they were together in New York, just before he left, for the purpose of giving Brown his final instructions, and although Hubbard, and probably Pollok, were there with them.

It is incredible that it could have been in the American specification on January 20, 1876, without being copied into the George Brown papers before he left for Europe; and equally incredible that it could have been interpolated between Brown's departure and February 14, 1876, without a new oath, and without being transmitted by first mail to Brown in England for insertion in the English papers; and if the interpolation was innocently made before February 14, 1876, it is well-nigh incredible that Bell, in his testimony, should not have taken pains to explain when and how it first appeared in the American specification, and why it was omitted from the George Brown papers. *The fact that Bell had never experimented upon the matters referred to in the interpolation* (see his Ans. 177, C. Vol. 1, p, 173; 450, C. Vol. 2, p. 1644) is of great significance in this connection, as is also the fact of his repeated declarations that the paper taken by George Brown to England was a *copy* of his American specification. In 1877, when trying to mislead and "bluff" Gray by making him think that the matters in conflict between them had been invented by him long before Gray's invention, he stated in a letter to Gray (see C. Vol. 2, p. 1682, question and answer 566):

> "My *specification* had been prepared *months* before it was filed, and *a copy* had been taken to England, by a friend. I delayed the filing of the American patent until I could hear from him. At last the protests of all those interested in my invention, deprecating further delay, had their effect, *and I filed my application* without waiting for the conclusion of the negotiations in England."

Here the plain intimation to Gray was, that the paper taken to England was a "*copy*" of the "specification" which was afterward "filed" as an "application;" *and we shall see, further on, that this was most indubitably the exact truth,* but that the specification that was "filed" was not the specification that was "*patented*."

We are, therefore, as we submit, fully warranted in the belief that the application, when filed on Feb. 14, 1876, did not contain the interpolated matter; *and that the interpolation was made after knowledge of Gray's caveat, and by Pollok's clerk, in whose handwriting the original application-papers had been written;* and was made with the connivance of the examiner, Wilbur, whose guilty relations with Pollok in respect to the Gray and Bell matters have been already demonstrated from the record. *This conclusion is impregnably established by what now follows.*

Fourth revelation.

Two certified copies, from the patent office, of Bell's application papers in the matter of his patent of March 7, 1876, are in evidence in the record, to wit, one copy, *certified on April 10, 1879* (C. Exhibits, pp. 5–13), and one, *a photograph copy, certified on October 30, 1885.* (Add. proofs, pp. 729-744.)

The specification of the *patent,* as printed and issued March 7, 1876, with the amendments of February 29, 1876, is also in evidence. (C. Vol. 1, occupying the twelve pages, immediately following p. 54.) *We thus have three patent office copies of Bell's Specification,* all of which ought to agree. But here the remarkable fact appears that, while the specification printed March 7, 1876, as a part of the patent, and the photographic *fac simile* of October 30, 1885, agree almost exactly with each other, *neither of them agrees with the certified copy of April 10, 1879!* Yet each, being a certified copy, imports verity, and proves that the record stood as certified, *at the time of its certification.* Hence the legal conclusion is that, on March 7, 1876, the papers appeared *one way,*—on April 10, 1879, *another way*—and on October 30, 1885, *changed back* to correspond to the printed copy attached to the patent.

"But" (The court may inquire), "in view of the fact that the copy of Oct. 30, 1885, is a '*photographic fac simile*' of the paper then on file in the patent office, *as the original Bell specification,* (See Commissioners Certificate, Add. proofs, p. 729,) and that it corresponds exactly with the printed specification attached to the patent on March 7, 1876, must we not inevitably conclude that the differences observable in the certified copy of April 10, 1879, were *errors made* *by the clerk who wrote that copy,* and not detected by the commissioner who certified it as correct?"

Ordinarily, this would be a tenable hypothesis in such a case—*but it is not so here!* The proof is absolutely overwhelming and unanswerable *that the record has been foully tampered with* in the interest of Mr. Bell, *since April 10, 1879! And that it was done to cover up some prior deviltry that was in danger of being exposed as the record before stood!*

We have already stated what we conceive to be unanswerable reasons for believing that the copy taken by George Brown to England, at the end of January, 1876, *was substantially identical with the specification then already sworn to, and two weeks afterwards filed in the United States Patent Office;* and that, so far as the patent of March 7, 1876, disagrees with the George Brown paper, the *patent is a fraud* and the disagreeing matter *an interpolation made after February 14 and before February 19, 1876. The certified copy of April 10, 1879, decisively proves this to be the fact!*

There are *thirty-nine separate statements* in the certified copy of April 10, 1879, which disagree with the statements respectively found at the same places in the patent and in the photographic *fac simile; and every one of those thirty-nine separate statements in the copy of April 10, 1879, is an exact copy of the language found in the same connection in the George Brown Paper!* By no conceivable possibility could such a coincidence have happened by chance. It stands absolutely demonstrated, that when the commissioner's copyist made that copy, on April 10, 1879, he had before his eyes, in the Bell specification *then on file,* the *exact phraseology of the George Brown copy of January, 1876,* which phraseology *has since disappeared from the patent office record,* as is conclusively proved by the *fac simile!* This disappearance could have happened by no accident! The fraud begun in February, 1876, has been finished off by what is substantially a forgery, since April, 1879!

The court can not realize the startling force of this proof, until it compares the thirty-nine passages in the different copies with the George Brown paper.

First, it will find that the 1879 certified copy showed that the original patent office specification *was full of erasures and interlineations*, which are faithfully reproduced, for the most part, in the 1879 copy, *but which fail to appear in the photographic fac simile of 1885*. We should not, of course, expect them to appear *in the patent*, which would only be a copy as corrected; but that they were there in 1879, is clear, and that they are not in the photographic *fac simile*, shows the latter to be a fraud.

Second, it will find that statements appeared in the 1879 copy *which there were strong reasons for Mr. Bell's wishing to disappear; and that they have accordingly disappeared since that date.*

Third, it will find that the thirty-nine passages correspond so curiously to the George Brown copy—*mistakes and all*—that the entire correspondence of the whole original patent office specification with the George Brown copy can no longer be doubted.

Referring to the certified copy of 1879 (C. Exhibits, pp. 6–13), the thirty-nine passages will now be pointed out—commencing with the passages shown as erased and interlined.

1. On p. 6, line 11, the 1879 copy says: "to produce its fundamental note (tone) by one only," etc., etc. The brackets indicate an erasure and interlineation in the record, *as the record appeared on April 10, 1879*. Referring to the George Brown copy, (C. Exhibits, pp. 936–947) we find that the original word was "*tone*," and that it was therefore erased and "*note*" interlined before the patent issued. Both words appeared on the record in April, 1879, only one of them now!

2. On p. 6, line 26, the 1879 copy says: "Over the same circuit (wire)." Brackets again indicate an erasure and interlineation. Referring to the George Brown copy (p. 937), we find that the original word was "*circuit*," and that it was erased and "*wire*" interlined before the patent issued.

As before, *both* words appeared on the record on April 10, 1879, and only one in 1885.

3. On p. 6, lines 31, 32, the 1879 copy says: "My present invention consists in the employment of a vibratory (or undulatory) current of electricity," etc., etc. Here brackets again indicate interlineation.

The photographic *fac simile* (Add. proofs, p. 731,) says simply: "My present invention consists in the employment of a *vibratory* current of electricity." The George Brown copy, on the contrary, says "*vibratory or undulatory*." In 1879, the patent office record, at this point, corresponded to the George Brown copy, and not to the patent office record of 1885. The amendment of February 29, 1876, (C. Exhibits, p. 16) struck out the entire passage and inserted in lieu of it the passage that now appears in the patent, containing the words "vibratory or undulatory," but that is no reason why both words should have appeared as a part of the *original* specification in the record in 1879 and only one of them in 1885.

4. On p. 7, line 3, the 1879 copy says: "simultaneously over (on) the same circuit." Brackets again indicate erasure and interlineation. Referring to the George Brown copy, we find that the original word was "*over*" and that it was erased and "*on*" interlined before the patent issued. As before, both words appeared on the record in 1879, and only one in 1885.

5. On p. 7, lines 5 and 6, the 1879 copy says: "That a closed circuit and single main battery may be used (employed)." Brackets again indicate erasure and interlineation. Referring to the George Brown copy, we find that the original word was "*employed*" and that it was erased and "*used*" interlined before the patent issued. Both words appeared on the record in 1879, only one in 1885.

6. On p. 7, line 8, the word "using" appears in the 1879 copy, but not in the patent nor in the photographic *fac simile*. It *is* found in the George Brown copy, showing that the patent office clerk made no mistake in copying,

but that the word appeared on the record in 1879 and has since been removed.

7 and 8. On p. 7, lines 35 and 36 (second and third from the bottom of the page), the 1879 copy reads: "four impulses of B (A) being made in the same time as five impulses of A (B)." Brackets again show erasure and interlineation. Referring to the patent and photographic *fac simile*, we find them to read: "four impulses of B being made in the same time as five impulses of A." Referring to the George Brown copy, we find it to read: "four impulses of A being made in the same time as five impulses of B." The original patent office specification was, therefore, written the same as the George Brown copy, and the letters A and B were erased and the letters B and A were substituted, respectively, before the patent issued. The record in 1879 showed the erasure and interlineation; the photographic *fac simile* does not. Now, referring to the *drawing* of the George Brown copy (C. Exhibits, p. 946), it will be seen that *the shortest curves are in line B, so that four impulses of A were in fact equal to five of B, as there represented;* whereas the *patent* drawing has *reversed the curves, making the shortest curves in line A*, so that, in the patent, *four impulses of B are equal to five of A*. The original specification filed in the patent office, therefore, *made a mistake of fact by following literally the words of the George Brown copy, without correcting them to correspond to the new drawings*. The 1879 copy shows the mistake and its correction; the photographic *fac simile* shows neither mistake nor correction.

9, 10 and 11. Precisely the same thing occurs again in the last three lines of p. 8, where the letters A and B are shown by the 1879 copy to have been again erroneously used in the original specification, and to have been erased and interlined correctly before the patent issued. The original paper invariably corresponded to the George Brown copy, but the photographic *fac simile gives no hint of the fact*.

12. On p. 8, line 28, the 1879 copy (as also the *patent* and the *George Brown paper*) reads: "The horizontal *line* a d e

f," etc. The photographic *fac simile* (C. Exhibits, p. 735) reads simply: "The horizontal a d e f," etc., omitting the word "*line*." If the specification had read thus in 1876, the patent would necessarily have been printed as the photographic *fac simile* reads. But the 1879 copy and the George Brown copy both show the word "line," and it was undoubtedly in the record *until the fraudulent alteration was made* between 1879 and 1885, when it was *inadvertently* omitted by the author of the fraudulent copy.

13. On p. 10, lines 14, 15, the 1879 copy reads: "And in vibrating it produces (yields) a musical note of a certain definite pitch." Brackets show erasure and interlineation. By reference to the George Brown copy it will be seen that the original word was "*yields*," and that this word was erased and "*produces*" interlined before the patent issued—the record in 1879 showing both words; the record in 1885 showing only one of them.

14. On p. 10, line 23, the 1879 copy reads: "The coil of the *distant* electro-magnet f," etc. The patent and the photographic *fac simile* omit the word *distant*, but the word was visible on the record in 1879, for the same word appears in the George Brown copy.

15. On p. 10, lines 26, 27, the 1879 copy reads: "When the pitches of the two instruments, *A I*, are different." The patent and the photographic *fac simile* omit the capitals "A I" at this point; but their insertion in the 1879 copy was no mistake of the copyist, for we find them at the same point in the George Brown copy.

16. On p. 10, lines 36, 37 (last two lines of the page) the 1879 copy reads: "They continue sounding so long as the mechanical vibration of B^1 is continued, but become silent *the moment its motion stops*." The patent and photographic *fac simile* read as follows: "They continue sounding so long as the mechanical vibration of B^1 is continued, but become silent *with the cessation of its motion*." In the George Brown copy, the words are, "*the moment its motion stops*." The copyist in 1879, therefore, made no blunder, but copied what appeared before him in the record at that

time, *and the record was afterward changed* before the photographic *fac simile* was made in 1885.

17, 18, 19. On p. 11, lines 1, 2, 3, the 1879 copy reads: "The duration of the sound may be used (*made*) to indicate (*signify*) the dot or dash of the Morse alphabet, and thus a telegraphic dispatch may be indicated (*can be transmitted*) by alternately interrupting and renewing the sound." The brackets indicate three separate erasures and interlineations. Referring to the George Brown copy, we find that the words of the specification as originally filed were "*made*," "*signify*," and "*can be transmitted*," and that they were all erased and the other words interlined before the patent issued. Both sets of words appeared in 1879; only one now appears in the record, as shown by the photographic *fac simile*.

20. On p. 11, line 12, the 1879 copy reads: "Simultaneously caused to vibrate (*set in vibration*)." Here, again, brackets show erasure and interlineation Referring to the George Brown copy, we find that the expression was originally "*set in vibration*," and that it was erased, and "*caused to vibrate*" was inserted before the patent issued. Both expressions were visible in 1879, only one of them now.

21. On p. 11, line 20, the 1879 copy reads: "When the armature *c*, Figure 5, is *mechanically* set in vibration;" whereas the patent and the photographic *fac simile* both read: "When the armature *c*, Figure 5, is set in vibration." The insertion of the word "*mechanically*," in 1879, was no blunder of the copyist, for the George Brown copy contains the same word in the same place. But this word, also, was expunged before the photographic *fac simile* was made. *There was a reason for desiring to get clear of this word*—by limiting the armature of Figure 5 to *mechanical* vibration, *it tended either to limit the armature of Figure 7 likewise*, (because Figure 7 is described as an improvement on Figure 5), or else it was totally superfluous.

22, 23. On p. 11, lines 26, 27, the 1879 copy reads: "The instruments A ^{1} and A ^{2} repeat loudly the signals of A, and *instruments* B ^{1} B ^{2} repeat *gently* (softly) those of B." Here, again, erasure and interlineation are shown by the brackets. The patent and photographic *fac simile* state the proposition as follows: "The instruments A ¹ and A ² repeat loudly the signals of A, and B¹ B² repeat *softly* those of B." The insertion of the word "*instruments*" before B¹ B², and of the word "gently" instead of "softly" was no blunder of the copyist, for precisely that form of expression appears in the George Brown copy.

24, 25. On p. 11, lines 31, 32, the 1879 copy reads: "Whereby motion can be imparted to the armature by *means of* the human voice or by (the tones) means of a musical instrument." Erasure and interlineation again. The patent and photographic *fac simile* read: "Whereby motion can be imparted to the armature by the human voice or by means of a musical instrument." The insertion of the words "*means of*" before "the human voice," and of "*the tones*" as originally appearing instead of of "means," was no blunder of the copyist; for the George Brown copy shows the same words that appear in the 1879 copy. They have been removed since the 1879 copy was made.

26, 27. On p. 12, lines 3, 4, 5, the 1879 copy reads: "Undulations are created (caused) upon the circuit E, *b*, *e*, *f*, *g*. These undulations are similar in form to the air vibrations caused by the sound, that is, they are (*can be*) represented graphically by similar curves." Erasures and interlineations again, which do not appear in the photographic *fac simile*. Referring to the George Brown copy, we find that the specification originally read as stated in the brackets of the 1879 copy, and that the words "*caused*" and "*can be*" were erased and "created" and "are" inserted, before the patent issued.

28. On p. 12, line 23 (third line of the second *claim*) the 1879 copy reads: "So that the vibration of the one shall occasion (*produce*) electrical undulations in the other," etc., etc. Erasure and interlineation again. Referring to the George Brown copy (second set of claims) we find that the second claim, as originally filed in the Patent Office, con-

tained the word "*produce*" instead of "occasion," and that the change was made before the patent issued. Both words appeared in the record in 1879, only one of them now.

29, 30, 31, 32, 33. In the claims, as copied in the 1879 copy, the words "substantially as set forth" (first claim), "substantially as set forth" (second claim), "as set forth" (third claim), "of the battery as set forth" (fourth claim), and "substantially as set forth" (fifth claim), are all enclosed in brackets, *showing that they were interlined while the application was pending* in the patent office. *None of these words appear in the George Brown copy. No brackets or interlineations appear in the photographic fac simile of 1885*, showing that the record has been altered since 1879. It will be remembered that the *fourth* claim was bodily interpolated into the application between February 14 and 19, 1876; and the 1879 copy shows that, *as first interpolated*, it ended with the word "*power*," and that the words "of the battery as set forth" were afterward inserted before the patent issued.

34, 35, 36, 37. Turning back once more to page 8, lines 29 to 31, the 1879 copy reads as follows: "The elevations, *b b b* (*c c c*), etc., indicate impulses of positive electricity; the depressions, *c c c* (*e e e*), etc., show impulses of negative electricity; the vertical distance, *b d* (*c d*) or *c f* (*e f*), of any portion of the curve from the zero line expresses the intensity," etc., etc. Here we find erasures and interlineations again revealed by the 1879 copy which do not appear in the photographic *fac simile*. Referring to the George Brown copy, we find that the specification, as originally filed in the patent office, used the letters that are, in the 1879 copy, enclosed in brackets, and that these letters were erased while the application was pending, and the letters inserted as they now read in the patent. *But we find more than this*, to wit, *that the drawings of the George Brown copy were so lettered that the original lettering of the specification filed in the patent office exactly corresponded to them*—that is to say, that *when Mr. Pollok's draughtsman made the new drawings for the patent office, in January, 1876, and inadvert-*

ently changed the curves as hereinabove shown, it escaped notice that the lettering of the specification must also be changed to correspond, and so the specification went into the patent office exactly like the George Brown copy, and had to be changed afterward before the patent issued.

38. The first sentence of the "interpolated paragraph," on p. 9, commencing with the words "electrical undulations" in line 28, appears in the 1879 copy inclosed in brackets, showing that, at that time, this sentence either appeared in brackets or as an interlineation. In the photographic *fac simile*, no brackets appear—showing that the record has been altered since 1879. But the patent contains no brackets around this sentence—showing that it was an interlineation made after the specification was filed and before the patent was issued. The patent would, of course, show brackets where the original paper indicated that they were intended by the writer to be actually used, but would not show them where they would only indicate a correction of the original manuscript.

39. And now we come to the most remarkable and *suggestive* of all these changes—*a passage corroborating in the most conclusive manner our theory, that the entire description of the variable-resistance current and apparatus, together with the fourth claim based upon it, was bodily interpolated into the application after it was filed in the patent office!*

On p. 9, lines 15, 16, 17, the 1879 copy reads as follows: "There are many ways of producing undulatory currents of electricity, *but all of them depend* for effect upon the vibrations or motion of bodies capable of inductive action." That is to say, "*all of them*" are *magneto-electric*, and *none of them depend upon varying resistance!* If the specification was originally filed in the patent office *without* the "interpolated matter," *this statement was perfectly consistent;* but if the specification was originally filed *with* the "interpolated matter," *this statement contradicted the rest of the specification in terms,*—for it could not be true that *all* of them depended upon induction or magneto-electric action, but *some* of them depended upon variable resistance. The writer might as well have said that "*all of them*" are *black*, but *some* of them are *white*—that all of them are *horses*, but some of them are *cows*. It is impossible that so gross an absurdity should have escaped the attention of so sharp and critical a man as Mr. Bell. He had *written and re-written the specification a number of times, and finally adopted that mode of expression that seemed to him best to explain his invention and the relation that one part of it bore to another*. (Bell, C. Vol. 2, p. 1620, Ans. 394). He had "tried to express it *in language that should be scientifically accurate and complete*, and to the best of" his "ability" he "did so." (Bell, C. Vol. 2, p. 1677, near bottom of page.) It had been submitted to Pollok between December 1 and 15, 1875, and again from January 10 to 18, 1876, and Pollok's sharp eye had detected no inconsistency in it. (Bell, C. Vol, 1, p. 156, Ans. 115.) Pollok made a "*fair copy*" of it and returned the copy to Bell for the oath, January 18, 1876. (Bell, C. Vol. 1, p. 157, Ans. 119.) Bell had sworn to it on January 20, 1876, and sent it to Pollok, and then had called Pollok to New York and spent with him (and probably Brown and Hubbard) a day in going over it with the utmost care, but "no change whatever was made in it, and Mr. Pollok took it back with him" and filed it just as it was. (C. Exhibits, top of page 1011.) *The specification, when filed in the patent office, was not full of erasures and interlineations*, but was, on the contrary, *the* "*fair copy*" which Pollok had made betwen January 10 and 18, which Bell had sworn to January 20, and in which "*no change whatever was made*" thereafter previous to its filing. Yet this "fair copy," when filed, stated substantially in express terms, that no current except the magneto-electric current could be employed for producing electrical undulations!

But when, on February 14, 1876, or within five days thereafter, Pollok's "underground railway" to the Examiner's room in the patent office, had brought him complete knowledge of Gray's caveat and its contents, *it was instantly revealed to him that this statement was not true*—and that there *was* another current which could produce electrical undulations *without* "the vibrations or motion of *bodies capable of* *inductive action.*" There was instant danger that Gray might apply this new current to multiple telegraphy, and thereby steer entirely around Bell's invention. Mr. Pollok's *clerk* (who wrote the "fair copy" only a month before) was ready at hand, available to substitute, in the same handwriting, a new "fair copy," with a contained description of the variable resistance current, and with a broad claim for producing undulations in it. The Examiner was corrupt, and was already in collusion with Pollok and Bell to rob Gray. It was an easy matter, under such circumstances, to withdraw the specification and substitute another, re-written in whole or in part, to describe and claim Gray's current and its undulations for multiple telegraph purposes. Perhaps they dared not go further and claim Gray's principle as applied to a *telephone;* but, as Gray had not described or claimed it for a *telegraph*, there seemed no especial danger in appropriating it to that extent. More probably, both Bell and Pollok believed that it would not answer for sound-copying, because it could not manifest the back-and-forth movements, corresponding to the movements of the air-waves. At all events, the interpolated description and claim were introduced among the *telegraph* appliances, and the described theory of sound-copying was not changed from that originally filed.

In the hurry and anxiety attending upon the surreptitious introduction of this new subject-matter and claim, (and, perhaps, in the absence of Mr. Bell himself,) it was not at first observed that the new interpolated matter made arrant nonsense of the statement that "there are many ways of producing undulatory currents of electricity, *but all of them depend for effect upon the vibrations or motion of bodies capable of inductive action.*" But when Mr. Bell arrived in Washington, and made the long series of erasures and interlineations hereinabove set forth, his sharp eye at once detected the absurdity of allowing *this* passage to remain, *now that the interpolated passage and claim were there to contradict it.* It was hardly prudent to withdraw, and re-write the specification again; so, probably by a pencil amendment, (often allowed at that time by examiners in mere clerical corrections,) he drew a line through the words "*but all of them depend*," and interlined the word "*dependent*," instead. The specification then merely declared in substance that there were many ways dependent upon induction and many ways not dependent upon induction, and thereby became consistent and sensible. The patent was printed as corrected in pencil; but, in the three years thereafter, through many handlings, the pencil marks were rubbed out, and the original words alone appeared. Hence, in 1879, the original words were copied and certified by the Commissioner.

No theory of *mistake* can be set up as to the copy of April 10, 1879, on this subject; for the words of the copy—the words that then alone remained legible in the original specification—are again found to be *the identical words of the George Brown copy!* They were, therefore, in the original patent office specification; they were obliterated before the patent was printed, and the word "dependent" was substituted; the word "dependent" was in turn rubbed out, and the obliterating mark made to conceal the passage: "*but all of them depend*," was also rubbed out, prior to April 10, 1879, and the original ink-written words again appeared; and, between 1879 and 1885, the record has been changed so as to destroy all its evidences of the real history of the great original fraud. Fortunately, in the Providence that sometimes seems to interfere in the interest of justice, the George Brown copy and the certified copy of 1879 remained to reveal, in their relations to each other, the whole iniquity.

Once more. In the George Brown copy we find two sets of claims, *the first set containing four claims, drawn in language not corresponding* to that of the specification originally filed in the patent office,—*the second set also containing four claims corresponding* almost *verbatim* to the claims *originally filed in the patent office*.

What is the meaning of this? Simply this:—Bell had put the final touches to his claims in the early part of January, 1876. "I *completed* the specification for my American patent early in January" (Bell, C. Exhibits, p. 1010, near bottom of page.) He had, afterwards, to wit, on or about January 25, 1876, met Mr. Brown in New York city, and "handed to" him an old copy of the specification, after cancelling the old claims that had first been written in it and inserting the new and more satisfactory forms of claims. The fact, of itself, indicates that Bell had compared and corrected the paper before handing it to George Brown, so as to put it into its final and best shape.

Now, if we take the certified patent office copy, of April 10, 1879,—leave out the amendments filed formally on February 29, 1876, and reject the changes indicated by its brackets to have been made, by erasure and interlineation while the application was pending in the patent office—we shall have remaining *a document which is, to all intents and purposes, an exact duplicate of the George Brown copy*, as corrected and handed to him on Jan. 25, 1876, after the American specification was sworn to—— but with the added "*interpolated passage and claim*," and *with the statement of an additional "advantage"* (*see p. 7 of the 1879 copy*) as follows: "And that cable dispatches may be transmitted more rapidly than by means of an intermittent current, or by the methods at present in use; for, as it is unnecessary to discharge the cable before a new signal can be made, the lagging of cable signals is prevented"— an advantage which evidently occurred to Mr. Bell or Mr. Pollok while the application was pending, and which was accordingly interpolated when the variable-resistance matter was interpolated. The *descriptive* matter, *statement of invention*, *statement of sound-copying theory*, *claims*, and all (except merely the interpolated matter about the variable resistance, and the reference to the additional advantage in preventing the lagging of cable signals) *will be precisely the same as in the George Brown copy.*

It is, therefore true, as Mr. Bell wrote to Gray on March 2, 1877, (C. Vol. 2, p. 1682,) that a "*copy*" *of the specification* was taken to England by a friend *before it was "filed;"* but it is equally true that the letter was skillfully designed to deceive and mislead Gray, and, by a *suggestio falsi*, to induce him to abandon his claim to priority of invention of the sound-copying variable-resistance current; for neither the "copy" nor the "specification" contained a hint of such a current as Gray's when the application was filed.

In the light of these facts, it is quite conceivable that the interference, between Bell and Gray, was dissolved on February 19, 1876, by some chicanery in the manipulation of the dates. Gray was unconsciously in the power of a corrupt conspiracy of scoundrels, who were ready to practice any fraud to defeat him, and who had full possession of the means, in the patent office, to carry on their work.

In view of the above facts, is there any doubt why Bell made a liquid transmitter immediately after his interview with Wilbur—why the apparatus exactly coincided with that of Gray's caveat--why Bell kept silent about the demonstration of speech-transmission, with it—why Bell's apparatus of April, 1876, exactly coincided with Gray's caveat receiver—and why Bell, in his London lecture, sought to connect the April, 1876, instruments, directly with the July, 1875, instruments, ignoring what had occurred in the meantime?

We have seen that the American specification, as filed Feb. 14, 1876, was exactly like the copy which George Brown took to England on the last week of January, 1876; but that, while in the patent office, it suffered *three* separate amendments, viz., first, when the interpolated invention was stolen from Gray and inserted; second, when the whole was subsequently revised to make it consistent with itself; and third, when the formal amendment of Feb. 29, 1876, was made. These amendments amended it *away from* the words of the George Brown copy.

We have also seen that the George Brown copy was originally written in October, 1875, and was afterwards revised and corrected before it was handed to Mr. Brown at New York, on or about January 25, 1876.

Before revision, the George Brown copy was not *verbatim* the same as the American specification—*after revision*, it was a *verbatim* duplicate.

It follows, therefore, that it was not revised and corrected until the American specification was *completed*. The American specification was not completed till Jan. 1–10, 1876, and was not thereafter changed in any respect till filed. *The George Brown copy, therefore, was not revised and corrected to assume its completed form until as late as Jan. 1–25.*

As to the exact time of the comparing of the two papers together and revising the one by the other, there are but two possible hypotheses—either, first, the specification was *independently* completed between Jan. 1 and 10, and the Brown copy *afterward* compared with it *and corrected to conform to it;* or, secondly, the Brown copy was revised and its phraseology made satisfactory between Jan. 1 and 10 and then the specification was *copied* from it, and sent to Pollok on January 10. *In either case,* the specification and Brown copy were carefully compared with and made to conform to each other, *after January 1, 1876, and before George Brown left for England*. There is no escape from this conclusion; because the Brown copy was revised to make it agree with the *completed* specification, and the latter was not *completed* till Jan. 1–10, 1876, and we have Mr. Bell's word for it that it was never afterward altered till it was filed, and that the amendments of the Brown copy were all made before Brown left for England.

The variable-resistance matter was, therefore, not in the American specification between January 1-10, 1876—if it had been the revision of the George Brown copy, at or after that time, by comparison with the American specification, would have caused it to be inserted in the Brown copy also. It is absolutely incredible that when comparing the two papers together and correcting one by the other, so carefully in mere matters of verbal criticism, not only should the infinitely weightier matter of the entire variable-resistance current and apparatus have been passed over without notice, but statements should have been left unaltered in both papers to the effect that no current except the magneto-electric current could be employed for the purposes of the invention.

Thus the erased and amended record of April 10, 1879 demonstrates absolutely that the application filed by Bell in the patent office on Feb. 14, 1876, was an exact duplicate of the George Brown copy; while the erased and amended George Brown copy, in turn, demonstrates conclusively that the latter was carefully compared with Bell's completed patent office specification, and made to conform thereto even in mere verbal details; and Bell's testimony proves that this must have been done after January 1, and before February 1, 1876. Can there be any doubt as to the exact time and place, when and where it was done? The two papers *were together* in New York on January 25, 1876—the Brown copy to be handed to Brown to take to Europe; the sworn specification to be finally reviewed and criticised by Bell, Pollok and Hubbard for the patent office. *Then* was the exact time when they would be compared and made to conform *verbatim* to each other.

The most astounding part of the fraud, is the attempt to cover it up by again changing the record since 1879. Why was this delayed till so late a date, and why, at that late date, attempted at all? We answer that, *prior to the summer of 1880*, although there was some interference litigation going on, and the Dowd suit had been commenced but settled by compromise, the different interests were, for the most part, only *apparently* in conflict, and were really under the control of the Bell Telephone Co. and the Western Union Telegraph Co., which latter company now claimed to own both Gray's and Edison's inventions. There was no great danger of any damaging exposures in that connection. *But when the real litigation began in dead earnest, in the controversy with the People's Telephone Co. in the summer or early fall of 1880, then there was danger that the patent office fraud might be discovered*, and it clearly became of enormous advantage to Bell to remove all traces of it, if that could be successfully done. *Bona fide* litigations with other defendants followed—the number of hostile observant eyes increased—and the danger became pressing. *Some* hand, moved evidently by an *interest* paramount to all other considerations, possessed both the opportunity and the nerve to undertake the desperate work—*and the record was changed.*

Whatever explanations or disclaimers others may have to make as to their part in the perpetration or subsequent utilization of these frauds, we leave them to make as they may think best; we have no idea that appellee's counsel have had any knowledge of these frauds; *but as for Alexander Graham Bell,* who must have known all about the fraud practiced upon Gray in the surreptitious examination of his pending applications in 1875; who filed three applications in hot haste in consequence of that unlawful knowledge, and in order to reap important advantages from it; who must have been *perfectly* cognizant of the fraud practiced upon Gray and the patent office in February, 1876, and must have participated in it; and who knew *absolutely* that the record, as it appeared in the patent office on October 30, 1885, was a false record, and that the photographic *fac similes* used in his behalf at New Orleans and ready to be used in this case, are false and lying witnesses; *no explanation is possible.*

Eagleton M'f'g Co. v West, Bradley & Cary M'f'g Co.

111 U. S. 490.

PART V.

BELL UNWORTHY OF BELIEF AS A WITNESS.

If anything further were needed to demonstrate the worthlessness of any testimony that Mr. Bell might give or may have given, it will be found abundantly in his own deposition, when his different statements are compared with each other and with known facts.

He is a sharp, intelligent, cautious and acute witness, with a rare faculty for using language to express or conceal the subtlest shades of meaning—and with an *appearance* of honesty which is at once attractive and deceptive. Generally he knows exactly when to be silent, and when to speak out; but, presuming upon his own skill and acuteness in word fencing and evasion, and moved by his enormous greed for the honor and profit of the great invention in controversy, he has, in his testimony, at many points, lost his caution and boldly falsified facts when the proofs of his falsehood were ready at hand. We shall now proceed to point out some of these instances—but we have neither time nor space to enumerate them all.

1. On pp. 1624, 1628, 1629 (C. Vol. 2), he testified as follows:

" *Cross-Q.* 402. When did you first learn that Elisha Gray was before the U. S. Patent Office, with a caveat or application for an electric speaking telephone? *Ans. I do not know.* My impression is that I learned this from the following letters, dated respectively February 21 and March 5, 1877, received from Mr. Elisha Gray.

* * * * * *

" *Cross-Q.* 403. When did you first know that you had *any* competitor in the United States Patent Office for the invention of the speaking telephone? *Ans. I think in March, 1878,* when the telephone interferences were declared. I have already referred to the letters of Mr. Elisha Gray of February 25, and March 5, 1877, in this connection.

* * * * * *

In *Cross-Q.* 404, the caveat interference notice of Feb. 19, 1876, and the consequent proceedings were called to his attention, and he was asked:

"Did not these proceedings relate to your application for the patent of March 7, 1876, and did you not have notice of said letter, signed by Examiner Wilbur, and dated February 19, 1876, at the time or immediately thereafter? *Ans.* These proceedings did relate to my application for the patent of March 7, 1876. My recollection is that the proceedings in relation to the interference were managed entirely by my counsel, Messrs. Pollok and Bailey, without consultation with me, and that I merely knew that some interference had been declared and had been dissolved, without my knowing anything about the details of the proceedings."

From what we *now* know of Mr. Bell's relations to the Gray caveat, the court can, from these answers, readily appreciate the value of Bell's testimony on any point where his interests are an important factor.

2. On p. 1599 (C. Vol. 2) appear the following question and answer:

"*Cross-Q.* 340. Then prior to June 2, 1875, if I understand you, you did not believe that the vibrations caused in the armature of a receiving instrument by electrical undulations occasioned by the vibration of the armature of another instrument in the same circuit as the first, would be of sufficient force to prove practically useful for either of the purposes you have mentioned—that is, the purpose of reproducing articulate speech, or the purposes of multiple telegraphy—whether a permanent magnet were vibrated in front of an electro-magnet without a battery in circuit, or a plate of inductive material were vibrated in front of an electro-magnet with a battery in circuit; am I correct? *Ans.* I was extremely *doubtful;* I *hoped* that they might prove of sufficient force, *but was unable to decide* simply from the state of knowledge at the time, *without practical experiments to test the point.*"

Now, it is not true that he was "doubtful," or that he had any "hopes" whatever in the matter. In his preliminary statement in the *harmonic telegraph interference* (C. Exhibits, pp. 984–986), he states that, during the summer of 1874: "*The thought occurred of inducing the impulses by means of a permanent magnet instead of a battery*" (middle of p. 984);

that he then conceived of the apparatus shown in figures 15, 16, (pp. 994–995); but that (p. 986), "Fearing that ridicule would be attached to the idea of transmitting vocal sounds telephonically, especially by those who were unacquainted with Helmholtz' experiments, I said little or nothing of this plan. *Indeed, reflection convinced me that, however, feasible the scheme looked upon paper, it was impracticable, as the induced currents would be far to feeble to overcome any great resistance. For the same reason the plan shown in Figure 15 seemed impracticable save in theory, and I began to look about for some other method* of inducing alternate, positive and negative impulses, which should succeed each other at equal intervals of time, *and at last I hit upon the plan of making and breaking contract by means of a revolving cylinder*, as shown in Figure 17."

Again, in his preliminary statement in the *Speaking Telephone Interference* (C. Exhibits, p. 1002), Mr. Bell, referring to the same matter, says:

"The question arose in my mind whether an armature might not be set in motion by a membrane similar in shape and structure to that of the human ear, so as to produce a current which should correspond to the vibrations of the air. *I did not, at this time, devise any method of combining a membrane with an armature*, or attempt to construct any apparatus upon the plans I had conceived. I never constructed the instrument which I have described, made up of a number of armatures attached to a permanent magnet and tuned to different pitches, and which I had devised with special reference to multiple telegraphy, *because I thought that the currents which would be induced would be so exceedingly weak, that no useful effect would be produced by them corresponding to what I had theoretically attributed to them. I therefore turned my attention to other modes* of working out my plan of multiple telegraphy, which I was thoroughly bent upon reducing to practice immediately."

In view of these two statements of Mr. Bell, the former sworn to May 8, 1876, and the latter November 20, 1878, explicitly declaring that he regarded both forms of the conceived apparatus as utterly hopeless and impracticable, and "*therefore* turned" his "attention to *other* modes," the declaration in his 340th cross-answer, in March, 1883, that he was only "*doubtful*," and "*hoped that they might prove of sufficient force*," is simply false. He knew perfectly well that he had had no doubts and no hopes, but that he had abandoned the whole thing as impracticable without making even the simplest experiment to solve a doubt or confirm a hope.

3. The second apparatus referred to in the above two extracts from his preliminary statements, was his imaginary "*harp-apparatus*," as will appear by comparing Figure 16 of his Harmonic Telegraph Statement (C. Exhibits, pp. 995, 985–6) with Figure 8 of his testimony (C., Vol. 1, pp. 118 119). On p. 119 (C., Vol. 1), Mr. Bell testified as follows:

> "*Int. 38.* Did you ever build such an apparatus as Fig. 8; and if not, why not? *Ans.* I did not, *because of the great number of reeds that would be required, and because I saw that the instrument could be very much simplified.*"

This is the very instrument about which he had sworn, in his preliminary statements, that he did not build it *because he thought the currents induced by it would be too weak to produce any useful effect*, and that "*therefore*" he turned his attention to *other* modes! What reliance can be placed upon the word of such a witness?

4. In his testimony at the top of page 138 (C. Vol. 1) and the bottom of page 1621 (C. Vol. 2), he alleges that he heard "timbre" during the experiment of June 2, 1875; whereas, in his letter written June 2, 1875 (C. Vol. 1, p. 136), after the experiment was over, he describes with great exultation his recognition of pitch and loudness, *but is totally silent as to the greatest of all results—timbre!* Again, in his letter of July 1, 1875 (C. Vol. 1, p. 143), he speaks as though timbre had not yet been produced, but he was going to make an experiment the next day which he hoped would produce it. That he did not succeed is shown by his superscription on the George Brown sketch, "Exhibit Toronto Drawing," December 28, 1875 (C. Exhibits, sketches preceding page 3). In view of these letters, written at the time, is there the slightest doubt that his subsequent testimony as to hearing timbre on June 2, 1875, was false!

5. Watson's cross-examination in August, 1882, in the People's Telephone case, (see C. Vol. 1, pp. 307–333), had developed very strongly the damaging facts about Bell's experiment on March 10, 1876, with the Gray liquid-transmitter, and that the first speech was transmitted on that occasion, and that the thumb-nail armature magneto-telephones were made after that date, and were the first magneto-telephones to transmit speech.

Prior to this testimony of Watson, Bell had not even *attempted* to claim that he ever got a word of speech electrically until he produced the "thumb-nail" magnetos. In his *London lecture,* (C. Exhibits, p. 900) he had stated (Oct. 31, 1877), with relation to the instruments of July, 1875, and also to the "thumb-nail" instruments of April, 1876, as follows:

"The results, however, were *unsatisfactory* and *discouraging.* My friend, Mr. Thomas A. Watson, who assisted me in this first experiment, declared that he heard *a faint sound* proceed from the telephone at his end of the circuit, *but I was unable to verify his assertion.* After many experiments, *attended by the same only partially successful results,* I determined to reduce the size and weight of the spring as much as possible. *For this purpose, I glued a piece of clock-spring, about the size and shape of my thumb-nail,* firmly to the center of the diaphragm, and had a similar instrument at the other end (Fig. 24); we were *then* enabled to obtain *distinctly audible effects.*" And in his lecture, he illustrates his "unsuccessful and discouraging" (July, 1875,) apparatus, by a *copy of Figure 7 of the drawings of his patent of March 7, 1876,* and his successful (April, 1876) instruments, by a cut of a very different apparatus, similar to that which he gave Sir William Thomson in August, 1876. (See C. Vol. 2, p. 1661.)

Watson, in his testimony in the Doud case, in July, 1879, (C. Vol. 1, p. 203, Ans. 13,) had described the July 1875, experiment with equal explicitness, saying:—

"I shouted into the membrane telephone. Mr. Bell listened at the receiver. I think he heard nothing. We changed places. He shouted at the telephone and I listened at the receiver. I could hear a faint sound."

Bell had written, with his own hand, on the Toronto

Drawing, left with George Brown on December 28, 1875, these words:—

"First attempt to transmit the human voice. The varying pitch of the voice could be discriminated but not the quality. A sort of muttering effect was perceived at the receiving end, when a person talked very loudly at the other end."

Bell himself had testified in the Doud case, in July, 1879, (C. Vol. 1, p. 145, Ans. 90,) giving a highly colored statement of the result, but, admitting that no words could be **heard.**

"I do not remember, with any great distinctness, the details of the experiment, but I have a distinct recollection that during the course of the experiments Mr. Watson rushed up to the room at the top of the building, where I was, and informed me that he could distinctly hear me speaking, although he could not quite make out what I said."

To say that even this is rose-colored, in its exaggeration, is putting the fact mildly, in view of Watson's testimony.—

But when Bell was under cross-examination in the People's Telephone case, in March, 1883, after Watson had let out all the facts about the March10, 1876, experiment, and the true date of the thumb nail instruments, he began to feel the necessity of magnifying the July, 1875, experiments and their results, to the greatest extent that could be done; and he rose royally to the height of the occasion! He said, (C. Vol. 2, p. 1575, Ans. 282):

"I was interrupted by the sudden appearance of Mr. Watson, who had rushed up stairs in a state of great excitement, and who declared that he had heard vocal sounds proceed from the instrument to which he had been listening, *and that he could almost understand what was said.* * * * I have a general recollection that numerous similar experiments were made during June and July, and that I myself obtained audible results. *It is my impression that a few common words and sentences were occasionally understood,* but I can not give the details of any particular experiment in which this was the case. I only remember that the results were such as to lead me to the firm conviction that the speaking-telephone was a *fait accompli.* In consequence of this I took out a patent for the speaking telephone, without waiting to obtain any better results." And see his equally extraordinary answer 281, same volume.

It is clear that these answers were nothing more nor less than perjury. They are contradicted by his London lecture, by his letter of August 14, 1875, to Gardiner G. Hubbard, by his writing on the George Brown Toronto Drawing, by Watson's testimony, and by his own sworn statement in the Telephone Interference (C. Exhibits, p. 1009).

Even his counsel do not believe the yarn, for Mr. Storrow, speaking of these tests of July, 1875 said, "which it is claimed *and probably truthfully*, did not amount to the intelligible transmission of articulate words" (see his New Orleans Argument, p. 36). The man who could so stretch the truth to meet a supposed emergency in his suit, is unworthy of belief on any point where his interests are involved.

6. In his testimony in the People's Telephone case, in the same answer (282, C. Vol. 2, p. 1575), in which he falsifies the story of what was heard in July, 1875, he was obliged to admit that, on the occasion when Watson "rushed up," he himself had been able to hear nothing. He had, in his later cross-examination, set deliberately about the work of misrepresenting the performances and capabilities of those instruments, and he was sagacious enough to know that the question would arise: "Why could *you* not hear anything?" He was therefore ready to anticipate the question with an explanation, as follows:

"This inability I attributed *at the time* to the *noise of the machinery in the workshop*, and to the fact that *Mr. Watson was unable to throw out his voice with sufficient force* to set the membrane of his telephone into good vibration."

Was this the *true* explanation? Not at all. He himself, in his preliminary statement five years before (C. Exhibits, p. 1009), had given the *true* reason:

"I am free to say that the results were not as good as I had expected, *but I believed that the failure to obtain better results was due to the imperfect construction of the instruments or to their parts not being properly proporioned.*"

Here, again, the testimony in his deposition was clear perjury. He swore, as a *fact within his recollection*, like any other fact, that he, *at the time*, attributed the failure to a cause to which he never attributed it. *He had no such thing within his memory when testifying, but made up the excuse as he went along*, without regard to the state of his *memory*. If he had forgotten what he attributed the failure to "at the time," he should have said so; but he had no right to make up a story and swear to it as his memory. Such testimony is exactly what the law defines as perjury. It exhibits a dangerous inherent tendency *to make out a good case* at all hazards, and is of a character to discredit everything that depends upon the uncorroborated word of the witness.

In this instance, the story told by Mr. Bell, in cross-answers 281, 282, is particularly silly. Watson had sworn that he *shouted* at the telephone, but Bell could hear nothing; and that when Bell *shouted*, Watson could hear only a faint sound. Weakness of voice is a puerile suggestion, under such circumstances. The noise of the workshop is equally puerile. Would they not have tried the experiment elsewhere, or in the evening when the workshop was still, if *that* had been believed to be the cause?

PART VI.

THE PATENT OF JANUARY 30, 1877.

But little needs to be said concerning this patent, in view of what has gone before. When this patent was taken out, the magneto-telephone, in the hands of Mr. Bell and his assistants, was a completed invention, having received its latest improvements in October and November, 1876, and no longer remained a thing for "the future" to "discover." He therefore no longer sought to patent a mere *theory* or *current*, "in its present undeveloped state," as in March, 1876, but he addressed himself to the work of describing a *machine* and claiming the details of its construction.

As the only telephone invention which Mr. Bell had ever made (if he made any at all), was a magneto-electric apparatus, this patent, like the former, should be strictly limited to the magneto form of instrument.

But the same old variable resistance fraud turns up again in this patent, to vitiate it and destroy its validity even for what it might otherwise have protected.

With the proofs now before the court, if there is anything clear, it is that Mr. Bell had no legal right to appropriate, in *any* patent, at any time, the variable resistance invention, knowledge of which he had derived from Gray; and that any patent in which such a fraud should appear, must be thereby rendered utterly null and void. The statute provides that where error creeps into some part of a patent by inadvertence, accident or mistake, and without any fraudulent intent to deceive, such innocent error shall not affect the validity of the other parts of the patent; otherwise, it renders the whole patent void.

Now, if Mr. Bell, in January, 1877, attempted to weave the variable-resistance current or apparatus into his new telephone patent, and to make descriptions and claims to cover it, *there was no inadvertence, accident or mistake about the matter;* it was deliberately done to defraud and deceive the public and to cover and appropriate the invention of another, and the whole patent is clearly void.

Yet that is exactly what Mr. Bell did, in January, 1877, in the patent now in question; and he did it with a devilish ingenuity and cunning which at once betray the *motive*, as well as the fact that he fully appreciated the personal danger of *going too far*. The problem before him, as he apparently viewed it, was a difficult one; it was *to describe and claim* Gray's invention, without actually laying himself liable to the pains and penalties of perjury by swearing that it was, in fact, his own invention. His cunning and skill proved equal to the emergency. He actually succeeded in incorporating Gray's invention bodily *into this patent also*, but by indirection and insinuation only. Every statement of the specification as to the Gray form of device is *literally* true, and yet as to such matters, the specification is, in fact, a lie and a fraud, and was clearly a deliberate attempt to deceive the public and the courts, and to appropriate and cover Gray's invention of the variable resistance telephone.

He did it in this way: In his former patent of March 7, 1876, the fifth claim had not been made to include the receiver as a claimed element, but was drawn only to cover the *current*, and was limited to a current of special form, excited by a special magneto-electric apparatus. Taking advantage of this fact, he described the invention of his 1877 patent *as consisting mainly in the receiver*, and, stating that the form of the transmitter was utterly immaterial, he described first *his own* transmitter, and then simply declared that he had "heretofore *described and exhibited*" *other* forms of transmitters to "the American Academy of Arts and Sciences," as would be seen by reference to Volume XII of its proceedings.

The description to which we refer is as follows, italics being our own:

"*The essential feature of the invention* consists in the armature of the *receiving-instrument* being vibrated by the varying attraction of the electro-magnet, so as to vibrate the air in the vicinity thereof in the same manner as the air is vibrated at the other end by the production of the sound. *It is therefore by no means necessary or essential that the transmitting-instrument should be of the same construction as the receiving-instrument.*

"*Any instrument receiving and transmitting the impression of agitated air may be used as the transmitter*, although for convenience, and for reciprocal communication, I *prefer* to use like instruments at either end of an electrical wire. *I have heretofore described and exhibited such other means of transmitting sound*, as will be seen by reference to the proceedings of the American Academy of Arts and Sciences, Vol. XII."

The paper referred to was presented to the Academy, *May 10, 1876*, and the reference here mentioned will be found in C. Exhibits, pp. 75, 76, and is as follows:

"13. Electrical undulations can be produced directly in the voltaic current by vibrating the conducting wire in a liquid of high resistance included in the circuit.

"The stem of a tuning fork was connected with a wire leading to one of the telephones described in the preceding paragraph. While the tuning fork was in vibration, the end of one of the prongs was dipped in water included in the circuit. A sound proceeded from the distant telephone. When two tuning-forks of different pitch were connected together, and simultaneously caused to vibrate in the water, two musical notes (the unisons respectively of those produced by the forks) were emitted simultaneously by the telephone.

A platinum wire attached to a membrane completed a voltaic circuit by dipping into water. Upon speaking to the membrane, articulate sounds proceeded from the telephone in the distant room. The sounds produced by the telephone became louder when dilute sulphuric acid or a saturated solution of salt was substituted for the water. Audible effects were also produced by the vibration of plumbago in mercury, in a solution of bichromate of potash, in salt and water, in dilute sulphuric acid and in pure water." (See. also C. Vol. 2. p. 1658.)

To thus describe an apparatus, *in a patent specification*, by reference to the papers and documents of a remote scientific association, was a novel and unique proceeding, and would not have been done without a reason. When we come to know the history of the alleged invention, and *the peculiar relation of the patentee to the thing thus described*, we can, without difficulty, understand and appreciate the reason. It was simply an attempt, by insinuation and without directly swearing to the variable-resistance transmitter and current as his own invention, to enlarge the specification by construction so as to include the invention of Gray as well as his own; Mr. Pollok's "*clerk*" had borrowed the Gray current and apparatus and interpolated it into the former patent as a multiple telegraph invention. Mr. *Bell* had acquiesced in that fraud, and would now borrow the whole thing for telephone purposes, but, in so prudent and cautious a way as to leave the *court* to construe it into the patent *as a described equivalent*, rather than run the risk of describing and swearing to it as his own invention.

But, the facts now being known, it is clear that the court should, by reason of this fraudulent attempt to qualify the whole meaning and scope of the patent of January 30, 1877, hold the latter entirely void. In no event, it is submitted, can the patent be construed to include anything more than Bell's own invention—the magneto telephone.

The claims of this patent, here sued upon, are the *fifth*, *sixth* and *eighth*. (See Int. 21, C. Vol. 1, p. 40.) These claims are as follows:

5. "The formation, *in an electric telephone, such as herein shown and described*, of a magnet with a coil *upon the end or ends of the magnet nearest the plate*.

6. "The combination, *with an electric telephone, such as described*, of a sounding-box, substantially as herein shown and set forth."

* * * * *

8. "In a system of electric telephony, the combination of a permanent magnet with a plate of iron or steel, or other material capable of inductive action, with coils *upon the end or ends of said magnet nearest the plate*, substantially as set forth."

Reviewing these claims, it may be said at once that the *sixth* is utterly *void, on its face, as not being for an invention*. It is merely the putting of the mechanism *into a box*. No particular form of box is specified, nor does the specification state any function or result as derived from it. It is described merely as "*the cover or sounding box D.*" This description is afterward rendered still more indefinite by the statement: "I have shown the apparatus in one of its simplest forms, it being well understood that the same may be varied in *arrangement, combination, general construction* and *form*, as well as *material of which the several parts are composed*," which "blanket" statement covers the *box* as well as all else described. The identical mechanism out of a box would not infringe this claim; but in any kind of a box would infringe. *Why* it would infringe, does not appear, because it is not stated *why or how* the box acts as a "sounding-box." The prior patent of March 7, 1876, whether valid or invalid, published to the world the vibrating armatures and electro-magnets coupled with *boxes* to concentrate and direct the sound to and from the diaphragms;—does *this* box do anything more or differently? If so, why and how? We submit that the claim is clearly void.

The *fifth* and *eighth* claims are simply for the old *Schellen* form of magnet (See Additional Proofs, p. 448, and also Defendants' Exhibits p. 116*a*), when substituted for the Battery current of the March 7, 1876, patent, *as a means of polarizing the cores of the electro-magnets*, precisely the same purpose for which Schellen and Wheatstone had used the same devices in their telegraph and speed-indicating apparatus, years before. They involved no discovery of Bell's, but merely the use of known equivalents for polarizing electro-magnets. In his 1876 patent, he had polarized the cores by a battery current—here, he used a permanent magnet instead, but both were known equivalents for that purpose long before he entered the field. Bell understood their equivalency in 1873–4 (See Ans. 30–36, C. Vol. 1, pp. 116–118), and deduced the necessary result of the permanent magnet "from the well known laws of magneto-electricity." (Ans. 35, 147, C. Vol. 1, pp. 117, 165, and Ans. 334, C. Vol. 2, pp. 1597–8.)

Besides, the defendants' Tisdel receiver (C. Vol. 1, pp. 83, 84,) does not come within the express limitation of both claims to a permanent magnet, *having the coil upon that end which comes nearest to the diaphragm;* for in the Tisdel receiver, that pole *which terminates "in a thin metallic tongue a,"* is the pole which comes *nearest to the diaphragm,* and the coil is attached *not to that pole,* but to the other pole.

Both this patent and that of March 7, 1876, are completely anticipated by the prior inventions of Daniel Drawbaugh, as shown in our brief on the Drawbaugh case, filed herewith.

PART VII.

SOME GENERAL REMARKS UPON THE PATENTS OF MARCH 7, 1876, AND JANUARY 30, 1877.

So far as the patent of March 7, 1876, refers to an *apparatus* for electrical sound copying, it is, on its face, and in view of appellee's own evidence, almost conclusively invalid for want of that "full, clear and exact description and specification" which the statute calls for.

The *drawings* are not even professedly drawings of any complete *machine*.

Mr. Bell testifies (C. Vol. 2, pp. 1620, 1696,) as follows:

(*P. 1620.*)

"*Figures five and six do not pretend to show the full construction of the apparatus they illustrate, but are simply electrical diagrams.*"

* * * * * * * * *

Cross-Q. 395. "*Is Fig. seven of that patent,* like Figs. five and six, *only an electrical diagram? Ans. Certainly.*"

* * * * * * * * *

(*P. 1696.*)

Cross-Q. 608. Please explain exactly what you mean by the expression, "electrical diagrams," which expression you have used several times in your testimony? *Ans.* A diagram that would illustrate the general electrical arrangements described in the specification, and *that did not profess to be exact drawings of the apparatus, or even to show many of the mechanical details of construction.*"

The *drawings*, therefore, can not be relied upon to exhibit the construction of any completed apparatus.

The *specification* is equally deficient in the information required by the law. Its description of this *apparatus* consists substantially of *four printed lines!*

"The armature *c*, Fig. 7, is fastened loosely by one extremity to the uncovered leg, *d*, of the electro-magnet *b*, and its other extremity is attached to the center of a stretched membrane *a*. A cone, A, is used to converge sound-vibrations upon the membrane."

* * * * * * * * * *

It is the contention of appellees that this description, coupled with the drawing, Fig. 7, and with Mr. Bell's statement, in the specification, of the principle and theoretical mode of operation of the machine, is sufficient to enable any one "skilled in the art" to make the devices and successfully practice the invention. In the same breath, however, they tell us *there was no art*, and hence *no one skilled in the art*. But Mr. Bell's experiments had all been "unsatisfactory and discouraging,'' (London Lecture). He, himself, had been able to get only a "faint, muttering sound," and no "quality," hence no articulation (Toronto Drawing). It was for "the future" to "discover" the art (Letter of Aug. 14, 1875, to Gardiner G. Hubbard). *Bell*, certainly understood his theory or "principle," but he could not make his apparatus operate. His assistant, Watson, also understood it, and was "skilled in the art" in electrical matters, and *he* could not make the apparatus operate. They made "*many experiments, attended by the same only partially successful results*" (London Lecture), and it was not till April, 1876,—a month after the patent issued —that they discovered *how to change the construction* of the apparatus so as to make it work. The patent gives us no hint of what this change should be. Before the change, the apparatus would *not* operate; after the change, it *would*. The difference is the difference between an inoperative and an operative device, and this difference is exactly what the law requires to be clearly pointed out in the patent; but the patent is silent as to what it is, *because Mr. Bell did not himself know, and had not been able to find out, when the patent issued*. See *Appendix* following this brief.

What the appellees ask the court to do, is to construe the invention of April, 1876, into the prior patent *nunc pro tunc*, because, foresooth, Mr. Bell they say *afterwards* discovered how to make the apparatus operative by changing its construction ! There is not, it is believed, a decided case to be found where, under such circumstances, a patent has ever been sustained. The law requires certainty, not conjecture; accomplishment, not speculation, theory *and experimental failure.*

There can be no doubt, now, that Mr. Bell had, before his patent issued, a full and thorough knowledge of all there was in Gray's caveat. If he did not personally examine it, Mr. Pollok or Mr. Pollok's "clerk" *did;* and what they knew, Bell knew, and made use of his knowledge. The changes which he made in his April, 1876, instruments were simply the substitution of the details of mechanical construction of Gray's caveat *receiver* in place of the details of construction of his own July, 1875, instruments. The very first pair of magneto instruments which Bell ever made after knowledge of the caveat, were mere copies of the caveat receiver. How long would it have taken Mr. Bell to produce *a speaking telephone* if he had *not* had knowledge of Gray's caveat receiver! Who can answer this question? Would the world *ever* have had a "Bell telephone?" In law, is not Mr. Bell chargeable with the results of his fraudulent knowledge of Gray's apparatus, by a *legal presumption* against the originality of the changes which he introduced into his apparatus in April, 1876? If so, *who is in law, the inventor of that completed and operative apparatus of April, 1876,* Bell or Gray, or Bell and Gray jointly? Can the 1877 patent be held valid, in view of the facts which we now know concerning the genesis of this apparatus? *Does not the great monumental fraud run through the whole, from the beginning to the end of both patents, poisoning and invalidating all!* What can the court point to, of completed invention in either patent, and say that it is not tainted with the primal fraud and, possibly if not probably, the direct or indirect consequence thereof! *Contra spoliatorem omnia præsumuntur.*

It is no answer to all this to say, as the appellee's counsel do, that Gray has *acquiesced* in Bell's claim of priority of invention. Gray was deceived and misled by the falsehoods and frauds practiced upon him, and he is no more bound by his acquiescence thus procured, than he would be by a deed procured from him by fraud and falsehood. The charge that he stood by and saw Mr. Bell exhibit the liquid transmitter at the Centennial, without making any claim to the invention, is unquestionably a falsehood. It is, in substance, negatived by even the testimony of Bell, who swears (C. Vol. 1, pp. 159, 160, Ans. 133–135) that, although he had the liquid transmitters at the Centennial, he exhibited to the judges on Sunday, June 25, 1876, the operation of only the magneto instruments. (See Ans. 134, p. 160.) Thomas A. Watson, who swears so glibly (C. Vol. 1, p. 232), to seeing the liquid transmitter on exhibition at the Centennial, was not even present at the exhibition *of June 25th.* (See Bell, Ans. 135, C. Vol. 1, p. 160.) William H. Hubbard, who swears in the Dowd case (original Dowd record, p. 558, Ans. 8) that Bell showed and explained it to the judges on June 25th, is contradicted by Gray in the same case (same record, p. 126, Ans. 53), and more emphatically by Prof. Barker (*additional proofs*, pp. 6–11, 29–32), who made the arrangements for the exhibit, explained some of the instruments to the audience, virtually superintended the exhibition on behalf of Mr. Bell, and saw no liquid transmitter there, but testifies that Gray, on that occasion, explained to him *his* liquid transmitter. But even if Gray *had* seen Bell's alleged liquid transmitter there, the deception that was all along practiced upon him in regard to Bell's date of invention, and the mistaken confidence that he then reposed in Bell's assertions about it, would fully account for his acquiescence, of which so much is now attempted to be made by way of estoppel. Gray was, undoubtedly, lulled into inaction, but he was lulled into it by the fraudulent interpolations that had been introduced into Bell's application on its way through the patent office, and by the fraudulent representations that were made about it by Bell and his associates after the patent issued, as well as by a letter which *Wilbur* wrote him eulogizing Bell's *discoveries.* We are not of counsel for Gray, and have no interest in the fate of his invention, except to see, on behalf of our clients, the People's and Overland Companies, that the court understands the facts, and that it shall not be deceived by the frauds and false pretensions, which have for years successfully eluded detection, and deceived and misled not only Gray himself, but even the courts below.

In the foregoing brief, we have discussed the validity and scope of the Bell patents of March 7, 1876, and January 30, 1877, *in view of the matters shown in the appellee's own record*, and without reference to the clear and overwhelming evidence of the complete anticipation of both of them by the prior invention of Daniel Drawbaugh, which is discussed in separate briefs herewith filed.

This suit is brought in a court of equity, where the complaining party must come with clean hands. But here, *as shown by its own proofs*, introduced to bolster up its case, the complaining party comes with false and fraudulent title deeds, whose pretended honesty it has attempted to establish *by robbery and forgery committed upon the public records*. Its whole case is poisoned and rotten with corruption and iniquity. And yet, upon this rottenness and corruption, it is to-day maintaining a great monopoly, oppressing and robbing the public, and holding these appellants and other innocent parties enjoined from the enjoyment of their legal rights and the prosecution of their lawful business.

It is time that this wrong should be summarily stopped; and that the penitentiary should open its doors to receive the perpetrators of it.

LYSANDER HILL,

Of counsel for the Peoples and Overland Telephone Companies

APPENDIX.

As Bell had his instruments in 1875, and showed them in his patent of March 7, 1876, they were radically wrong in construction.

1. The armatures were too heavy. In the "reproduced" instruments tested by appellees in this suit (for cuts of them see C. R. Vol. 2, pp. 1709, 1710, 1714, 1715, 1718, 1720, 1721), the armatures were apparently made as thin as a watch spring—mere *lines*, as shown in some of the cuts. No appreciable inertia or momentum is possible in such armatures. Compare them, for a moment, with the heavy armatures of the original Bell instruments of 1875, as shown on p. 1012, of C. Exhibits, and see how the original instruments were departed from, in this particular, for the purpose of making the "reproductions" work in the so-called tests!

2. In the original instruments the armatures were arranged at an angle with the pole of the electro-magnet, in which position they would lose a portion of the attractive or inductive force. Compare again, and see how carefully the appellees' counsel and experts improved their "reproduced" instruments to remedy this defect, before submitting them to a test!

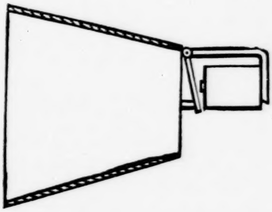
3. In the original instruments the pole of the electro-magnet pointed to the armature at a spot between the center and edge of the membrane, so that the attractive or inductive force was not exerted at the free end of the lever or armature, but intermediate between the ends. In the transmitter (which exerts the *inductive* force), this point on the armature would, in such case, have a *less range of movement* than the end, and hence the inductive force would be proportionately reduced, and a feebler current would pass over the line. This feebler current, arriving at the receiver (where it acts by *attractive* force), would, in turn, be exerted upon the armature there, not at the end of the lever where its leverage would be greatest, but intermediate between the

ends, *where the leverage would be against it;* and hence another portion of the force would be lost. With the force thus thrown away, a *heavy* armature would not obey the electric impulses, but would have a strong tendency to vibrate after a law of its own.

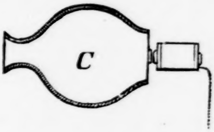
In "reproducing" instruments for tests, the appellees were careful (see C. Vol. 2, pp. 1715, 1718) to arrange the pole exactly opposite to the end of the armature, in the instruments where the heaviest armatures appear, from the cuts, to have been employed; but, in the other reproductions (see pp. 1709, 1710, 1714, 1720, 1721), where they arranged the pole to act between the ends of the armature (as Bell did in 1875), they have reduced the thickness of the armatures to a mere line. There was *method* in this. Very slight differences in these instruments affect the result. The reproduced instruments *talk;* the originals could not.

4. In nearly all the "reproduced" instruments, the hinges were knife-edge hinges, such as are used in delicate scales for apothecaries' and chemists' purposes—no friction, no resistance. How different from the crude structure shown in C. exhibits, p. 1012!

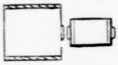
In Fig. 7, of the patent of March 7, 1876, all these defects appear. See cut below:



In Gray's caveat receiver, none of them appear. See cut below:



In Bell's improved (and *talking*) device of April, 1876, none of them appear, but Gray's construction is closely copied, as will at once be seen from the following cut of Bell's, April, 1876, device:



In appellees' so called "reproduction" tested in this case, the *form* of the patent device and the July, 1875, device is *apparently* retained, *but the substantial defects which render those devices worthless and impracticable*, and which Mr. Bell did not perceive nor know till after his knowledge of Gray's caveat, and after the date of his patent, *have been carefully and skillfully removed by somebody familiar with the present knowledge of speaking telephone constructions.* It is, therefore, evident that the appellees' tests prove nothing as to the alleged operativeness of Bell's 1875 instruments, or instruments made according to Fig. 7, of his patent, but only that a person familiar with the *present* knowledge of telephones can *now* take the old devices, and *by suitably altering them*, make them do what Bell and Watson could *not* make them do.

In his New Orleans argument, referring to the Reis transmitter, *Mr. Dickerson* (of appellees' counsel) said (p. 105): "You can, perhaps, make that send a Bell current *by slight alterations in it.*" Again (p. 108): "The question is how the two things *operate*, not how they *look*."

In the same case *Mr. Storrow* (see his printed argument, p. 91) said:

"A slight change in the *proportions* of such an apparatus may change the character of the operation, and consequently the result; *and the knowledge that one operation ought to be performed and the other avoided, will, with some instruments, enable the operator, without difficulty, to make the change.* But somebody must have the genius to discover what ought to be done.

"If an instrument exists which is intended and adapted to interrupt the circuit at each vibration, and is furnished to the community with a description and directions to make it interrupt the circuit at each vibration, the community, from that instrument and that description will not learn how to transmit speech. If another man comes and instructs the community that, by causing that instrument to perform a different kind of operation a new result, to wit the *transmission of speech*, can be accomplished; *then no matter how minute the change in the instrument might be, nor even though it only requires a new and different way of using it he will have made a great invention;* for, whoever first gives to the community the information which enables it to transmit speech by electricity has, in the language of the constitution, "promoted the useful arts," and his work and importance to the community is not anticipated by the fact that the machinery for transmitting speech, was within easy reach, *if anybody had only known how to do it.*"

Citing and quoting from several decisions of this court to sustain his legal position as here expressed.

But here lies the trouble with Bell: On February 14 1876, *he did not know how to do it*—he had a *theory*, but could devise no instruments capable of verifying his theory. But, having had knowledge of Gray's receivers, and changed his instruments in April, 1876, to correspond to them, and tested *those* instruments, he *now* had both a theory and an *apparatus* capable of doing the work, *and he now knew how to do it.* The court can not, however, construe this knowledge back into his previous patent, *nunc pro tunc.*

Appellants' Supplemental Brief on Bell's 1876 Patent.

It has fallen to our lot to write a history of the development of Mr. Bell's invention of the Speaking Telephone from the materials contained in the complainant's record. It is our purpose to assemble in one paper all the important testimony relating to this subject, now distributed throughout the bulky volumes of the record. This testimony will be accompanied with annotations in elucidation of the text.*

We shall search after the facts, and, where these are in controversy, it is our aim to arrive, as far as possible, at definite conclusions.

We shall rest content, if our work shall prove to be of even the slightest aid to the court in the consideration of the great questions involved in this case.

NOTE —The appellee's four volumes of proofs will be cited in this brief as C., Vol. 1, C., Vol. 2, C., Vol. 3, C., Exhibits, or Vol. 4—C. meaning complainants below.

The appellant's six volumes will be cited as D., Vol. 1, D., Vol. 2, D. S-reb., D. S-rej., D. Exhibits, and D. Add. Proofs—D. meaning defendants below.

I.

It appears from the statements of Mr. Bell, (C. Vol. I, p. 106; Bell's London Lecture, C. IV Exhibits, p. 879; Bell's Preliminary Statement in the Speaking Telephone Interferences, Id. p. 997,) that at an early period, through the enjoyment of exceptional opportunities, he acquired a thorough knowledge of vocal physiology, of the fundamental principles of articulation and of the characteristics and relative qualities of sound.

"My father was a teacher of articulation, and as he intended me to follow his own profession he very early gave me instruction in the anatomy of the vocal organs, the functions of the various organs of speech, and in subjects bearing generally upon the science of vocal physiology."

In the midst of a research conducted by him in the effort "to determine the characteristic tones of the vowels," he became acquainted, through Mr. A. J. Ellis, of London, with the valuable researches, experiments and discoveries of Helmholtz.

"He (Helmholtz) had succeeded in producing, artificially, certain of the vowel sounds by causing tuning forks of different pitch to vibrate simultaneously by means of an electric current. Mr. Ellis was kind enough to grant me an interview for the purpose of explaining the apparatus employed by Helmholtz in producing these extraordinary effects, and I spent the greater part of a delightful day with him in investigating the subject. At that time, however, I was too slightly acquainted with the laws of electricity to fully understand the explanations given, but the interview had the effect of arousing my interest in the subjects of sound and electricity, and I did not rest until I had obtained possession of a copy of Helmholtz' great work, and had attempted, in a crude and imperfect manner, it is true, to reproduce his results."

"The explanations which were given me of Helmholtz' experiment so interested me that I devoted myself to the study of electricity, my special object being to acquire a sufficient knowledge of the subject to enable me to understand Helmholtz' experiments."

"I felt that it was my duty as a student of speech to master all the researches of others that bore upon what was to be my professional study, and I therefore desired to witness the results obtained by Helmholtz, and investigate speech for myself in the manner shown by him."

"Immediately after the conversation with Mr. Ellis in 1867, I formed the resolution of reproducing Helmholtz' synthetical experiments, and finding that my knowledge of electricity was insufficient to enable me fully to understand his arrangement, I took up seriously the study of electricity. In the city of Bath, England, I made electrical experiments with a friend, and attempted to set a tuning fork in vibration by an electro-magnet. I do not remember the date of my visit to Bath, but I think it was in the year 1868; but it might have been earlier. From the year 1867 to 1870, I made numerous electrical inventions based upon Helmholtz' vowel apparatus, and before I left England, in 1870, I had made up my mind to pursue one of these inventions to a practical end. The invention to which I allude is now known as harmonic telegraphy or multiple telegraphy."

In this period of three years, within which he took up seriously the study of electricity, devoting more or less time to electrical experiments, and as results of his research, study and experiment, making numerous electrical inventions, he must have arrived at a clear comprehension of the principles and mode of operation of Helmholtz' apparatus, and of the important discoveries therein illustrated.

"The synthesis of vowel sounds made by Helmholtz was performed by means of an apparatus consisting of a series of tuning forks of different pitches, all of which were kept in vibration by an electro-magnet placed near their prongs, and through the coils of which intermittent currents were passed by a circuit-breaker, so that each tuning fork produced its own tone; and then, by means of resonators, which could be brought into action at pleasure, Helmholtz intensified these partial tones, more or less, or left some of them inaudible at the distance at which the hearer was placed, and thereby produced the quality of sound of whichever vowel he pleased."

Mr. Bell details at length the process of reasoning, through which he was led to the conception of his system of multiple telegraphy.

"While reflecting upon the possibilities of the production of sound by electrical means, it struck me that the principle of vibrating a tuning-fork by the intermittent attraction of an electro-magnet might be applied to the electrical production of music. I imagined to myself a series of tuning forks of different pitches, arranged to vibrate automatically in the manner shown by Helmholtz, each fork interrupting at every vibration, a voltaic current, and the thought occurred: 'Why should not the depression of a key like that of a piano direct the interrupted current from any one of these forks, through a telegraph wire, to a series of electro-magnets operating the strings of a piano or other musical instrument, in which case a person might play the tuning-fork piano in one place and the music be audible from the electro-magnetic piano in a distant city?' The more I reflected upon this arrangement the more feasible did it seem to me; indeed, I saw no reason why the depression of a number of keys at the tuning-fork end of the circuit should not be followed by the audible production of a full chord from the piano in the distant city, each tuning-fork affecting, at the receiving end, that string of the piano with which it was in unison. At this time, the interest which I felt in electricity led me to study the various systems of telegraphy in use in this country (England) and in America. I was much struck with the simplicity of the Morse alphabet, and with the fact that it could be read by sound. Instead of having the dots and dashes recorded upon paper, the operators were in the habit of observing the duration of the click of the instruments, and in this way were enabled to distinguish by ear the various signals. It struck me that in a similar manner the duration of a musical note might be made to represent the dot or dash of the telegraph code, so that a person might operate one of the keys of the tuning-fork piano referred to above, and the duration of the sound proceeding from the corresponding string of the distant piano be observed by an operator stationed there. It seemed to me that in this way a number of distinct telegraph messages might be sent simultaneously from the tuning fork piano to the other end of the circuit, by operators each manipulating a different key of the instrument. These messages would be read by the operators stationed at the distant piano, each receiving operator listening for signals of a certain definite pitch, and ignoring all others. In this way could be accomplished the simultaneous transmission of a number of telegraphic messages along a single wire, the number being limited only by the delicacy of the listener's ear.

The idea of increasing the carrying power of a telegraph wire in this way took complete possession of my mind, and it was this practical end that I had in view when I commenced my researches in Electric Telephony." (C. Vol. IV Exhibits, p. 881.)

The invention, combination and arrangement of the instrumentalities actually necessary to overcome the inherent difficulties remained yet to be accomplished. Success in this effort meant both fame and fortune for Mr. Bell. The commercial value of such an invention was capable of instant appreciation, and as stated by complainant's counsel in his brief in the court below,—"That was before the Quadruplex system came into use, and an instrument of that sort would have been of enormous value."

We can well understand and appreciate how, under such circumstances, the idea "took complete possession" of Mr. Bell's mind, and that in consequence, as stated by him (C. Vol. IV Exhibits, p. 886): "For several years my attention was almost exclusively directed to the production of an instrument for making and breaking a voltaic circuit with extreme rapidity, to take the place of the transmitting tuning-fork used in Helmholtz' researches."

And C. Vol. I, p. 109, "Int. 13. While you were in Canada and Boston, say up to the year 1873 or 1874, how much attention did you pay to the subject of electricity, and what particular use of electricity did you study and experiment upon?" A. "From the moment of my arrival in Canada, in 1870, up to the commencement of 1874, my mind was full of the scheme for the multiple transmission of telegraphic messages by means of musical tones to which I have already alluded. Up to October, 1872, I resided at my father's house in Canada, paying only occasional visits to the United States, each visit continuing for about two months. I had few facilities for experiment in Canada during that time, and none in the United States. I occupied myself chiefly, during my leisure time, in studying the subjects of electricity and sound, and in developing theoretically the practical details of my system of harmonic telegraphy. I also made such experiments as I could with the limited facilities at my command, at my father's house in Canada. From October, 1872, up to the commencement of 1874, I devoted all my spare time to practical experiments relating to the production of sounds by electrical means, with the object of reducing to practice the system of harmonic telegraphy. My daytime was completely occupied with professional work, and I carried on my electrical experiments chiefly at night."

Again, C. Vol. IV Exhibits p. 998. "After arriving in Canada, I pursued my electrical and acoustical studies, and made such experiments relating to multiple telegraphy as I had the means of making at my father's residence. I had good facilities for study, but very insufficient means for experiments. In October, 1872, I removed to Boston with the intention of making the United States my permanent residence. My professional occupation at this time was giving instruction in articulation to deaf-mutes, and lecturing upon the mechanism and nature of speech to teachers of the deaf and dumb who came to me from different parts of the world. My spare time I devoted to electrical studies and experiments with a view to perfecting multiple telegraphy.

In developing my plan of multiple telegraphy certain difficulties made their appearance, and I devoted myself during a summer vacation spent in Canada, in 1874, to devising means to overcome these difficulties, and also to devising new methods of studying sound optically, as aids in teaching articulation to the deaf."

We next note that before he left England, Mr. Bell formed the intelligent opinion and the belief that it was within the range of possibility that an apparatus might be constructed by which the elements of speech might be reproduced at a distance.

This was a rational opinion as to a possibility in general, as distinct from what would previously have been regarded as an absurdity, like one of Jules Verne's conceptions of a journey to the moon. But, on the other hand, he then neither formed any conception of the means requisite, nor entertained any thought of applying himself personally to the solution of the problem.

"From the moment that I became aware that Helmholtz had been able to produce vowel sounds with the aid of electricity, I believed that the other elements of speech might also be produced in a similar manner. I did not, while in England, form any idea of the details of an apparatus for producing speech in this way, but I did very distinctly have the belief that it was possible to construct such an apparatus. I am sure that I stated to friends in England, before 1870, my belief that we should one day speak by telegraph, but I had no idea that I would ever myself be connected with the realization of such a plan."

We have now in complete form, so far as it appears in the record, the history of Mr. Bell's work of invention in England and in Canada, and up to the time of his removal to Boston, in October, 1872.

From this point we shall be enabled to trace very clearly, from the materials afforded in the record, step by step, the progress made by Mr. Bell in his chosen work.

His progress toward the practical development of a system of multiple telegraphy, to which, at this time, he immediately devoted himself, is more clearly apprehended by observing the three definite and distinct stages which constituted the order of this development. In all three stages, sound was produced in the receiver by the rapid vibration of an armature in front of the pole or poles of an electro-magnet, but the apparatus employed was quite different in the successive stages.

II.

THE FIRST STAGE.

During the first stage, his apparatus was clearly modeled upon that of Helmholtz, the necessary variations in the magnetism of the electro-magnet being produced by the employment of a "vibrating circuit-breaker," which occasioned rapid "intermissions" in the electric current passing through the coils of the electro-magnet.

We find the details relating to this stage of the work given more specifically in Mr. Bell's preliminary statement in Harmonic interferences. (C. Vol. IV Exhibits p. 977.)]

"The experiments undertaken in Boston during the winter of 1872–3 related more particularly to the mechanical means of transmitting vibrations. I was acquainted with Helmholtz apparatus for the artificial production of vowel sounds; and all my earlier experiments were modeled upon his. Figures 1 and 2 illustrate the first form of apparatus constructed in West Newton street."

For the figures see C. Vol. IV Exhibits, p. 992–3.

"On account of the small size of the tuning-forks, and the imperfect means at my command, the vibrations obtained were not as satisfactory as had been hoped. The oxidization of the mercury too was a source of great annoyance, and was only partially obviated by covering it with alcohol. The instruments were taken to pieces and put together again without any better result, until I copied more closely the form of Helmholtz' instrument, by constructing the apparatus shown in Fig. 3.

"The instruments shown in Fig. 3 were constructed either in January or October, 1873, but at which period I am unable to state positively."

"In October, 1873, I resumed the practice of my profession in Boston (relinquished, through illness, the preceding July), residing at No. 292 Essex street, Salem, where the experiments with tuning-forks (arranged in Fig. 3) were resumed. In the same month (October, 1873) the attempt was made to substitute a free reed for the transmitting fork shown in Fig. 3. The free reed (R,) Fig. 4, formed the base of a hollow cone of gutta percha (gg); and it was set in vibration by blowing through the orifice O. A platinum wire P, attached to the reed R, dipped into mercury M. The original instrument is still in my possession. Somewhere about November, 1873, an article entitled, 'The Acoustic Telegraph,' published in 'The Wonders of Electricity,' led me to substitute steel plates for tuning-forks in my telegraphic experiments. Two transmitting instruments and two receiving instruments (specimens of which are still in my possession in their original form), were made like those shown in Fig. 5. These were arranged on circuit, as shown in Fig. 6. On pressing K^1, R^1 was set in strong vibration, while R^2 was unaffected save by a slight tremor, perceptible only to the sense of touch. On pressing K^2, neither of the receiving instruments R^1, R^2, responded save by the trembling alluded to above. On pressing K^1 and K^2 simultaneously, R^1 was thrown into strong vibration, but R^2 was not affected. Having no means of tuning the plate, I was unable to make R^2 respond to the vibration of T^2.

"Fig. 7 shows another form of instrument constructed during November, 1873.

"The instrument shown in Fig 8 was also made about the same time, consisting of an ordinary bassoon reed. A wire W was brought to the point P of the tongue, t, and fastened so that the vibrations of t caused P to strike against the metal surface M, thus causing an intermittent current to pass through the electro magnet f.

"It became evident to me, that with my own rude workmanship, and with the limited time and means at my disposal, I could not hope to construct any better models. I therefore, from this time, (November, 1873,) devoted less time to practical experiment than to the theoretical development of the details of the invention.

"The arrangement on circuit, at which I had then arrived, is shown in Fig. 9. There was one defect in the plan for which I sought a remedy. Communications could be sent in only one direction.

"While station A was sending to N any intermediate station could also send a message to N, or to any place between itself and N; but it could not communicate with A, or with any place in the direction of A, except by using another line.

"I saw that one wire would suffice for commuications

simultaneously in both directions if free earth communication could be secured at each end of the line.

"My first attempt to solve the problem was by the application of artificial resistance, as shown in Fig. 10. When the line was put to earth at the two extremities of the circuit A and N, any intermediate station (C) could cause half the intermittent current from its battery to pass to the earth at A, and the other half to the earth at N, by putting sufficient resistance on the shorter circuit

"Study of the arrangement, however, convinced me that the problem could not be solved by any arrangement of artificial resistances; and I was for a time at a loss how to overcome the difficulty."

It thus appears that the apparatus first made and represented by the Figs. 1, 2 and 3, was modeled more or less closely upon the working details of Helmholtz' apparatus (illustrated C. Vol. IV Exhibits, p. 895); that in October, 1873, an attempt was made to substitute a free reed for the transmitting tuning-fork used by himself and by Helmholtz, and that in November, 1873, he substituted steel plates for these tuning-forks, and also at the same time combined upon the same circuit two transmitters and two receivers, arranged as shown in Fig. 6.

It appears, however, that the practical results obtained from this apparatus were very unsatisfactory. One receiver would respond to its transmitter but the other would not. "On pressing K^1 and K^2 simultaneously, R^1 was thrown into strong vibration but R^2 was not affected. *Having no means of tuning the plate I was unable to make R^2 respond to the vibrations of T^2.*"

He then mentions the instruments shown in Figs. 7 and 8, and says: "It became evident to me that with my own rude workmanship and with the limited time and means at my disposal I could not hope to construct any better models. I therefore from this time (November, 1873), devoted less time to practical experiment than to *the theoretical developement* of the details of the invention."

This preliminary statement was sworn to by Mr. Bell, May 8, 1876. Three years later (July 8, 1879) Mr. Bell testified regarding the same period (November, 1873) as follows (C. Vol. I, p. 109):

"Int. 14. I call your attention to Figs. 1 and 2 in the drawing now shown you; When did you construct and use the apparatus therein shown? Ans. In November, 1873.

"Int. 15. Where? Ans. In Salem, Mass.

"Int. 16. Have you one of the originals of the apparatus there shown; if so, please produce it and state which of those figures it is like? Ans. I have, and I now produce it. It is a portion of a transmitting instrument like that shown at T, Fig. 1. All the parts are there except the mercury cup and wire to dip into it; one screw cup and a connecting wire also missing.

"Int. 17. When and upon what occasion were Figs. 1 and 2, or the figures of which these are lithographic reproductions, drawn by you? Ans. They were drawn by me some time before the 27th of April, 1876, as part of the illustrations of my preliminary statement in an interference at the patent office upon harmonic telegraphy.

"Int. 18. State whether you used at that time, in 1873, similar reeds and electro-magnets as receivers, attaching the reed directly to the base or a standard coming from the base instead of using the large box shown in these figures? Ans. I did, in November, 1873. The receiving instrument usually employed by me at that time consisted of an arrangement almost identical with the instrument now shown. This very instrument was frequently used by me at that time as a receiver, by untwisting the wires which connect the electro-magnet with the steel plate armature and passing the intermittent current from one of the interrupters through the coils of the electro-magnet, without passing through the plate.

"During the month of November, 1873, I varied the shape and size of the frame holding the receiver so as more conveniently to get at the plate in order to tune it to its proper transmitter.

"One of my favorite forms of receivers consisted of an arrangement substantially like the model shown, turned upside down, with the bottom of the box (then forming the top) removed, so that the reed was attached to a standard coming from the base. I found this form especially advantageous, as I could remove the plate and substitute others of different length and thickness.

"I now make a drawing of my favorite form of receiving instrument in November, 1873. Figure 3."

(Figs. 1 and 2, referred to, are exact reproductions of Figs. 5 and 6 attached to said preliminary statement, while Figure 3 represents a receiver evidently remodeled from the receiver shown in Fig. 1, as stated.)

"Int. 19. If you ever heard, from a single one of those receivers, tones of different pitches transmitted by transmitters of different pitch, please state when you first did so, describe what you heard, and the circumstances under which you heard it.

"Ans. In November, 1873, I arranged two current-interrupters and two harmonic receivers upon a single circuit, as shown in Fig. 2. The details of the instruments will be understood from Fig. 1. The plate armature of the receiver R^1 was intended to have the same normal rate of vibration as that of the interrupter T^1, and the plate armature of R^2 was intended to have the same rate as that of T^2. It was expected that upon depressing the key K^1, the intermittent current from the interrupter T^1 would traverse the circuit in which the receivers R^1 and R^2 were placed, and cause the reed of R^1 to be thrown violently into vibration, so as to produce its musical tone, and that the reed of R^2 would not respond in the same manner. It was also anticipated that upon depressing the key K^2, the reed of R^2 would be thrown violently into vibration, but that, that of R^1 would not; and that upon depressing both keys K^1 and K^2 simultaneously the reeds of both receiving instruments R^1 and R^2 would be thrown violently into vibration, producing musical tones at the receiving station of similar pitch to the tones produced at the transmitting station by the vibration of the interrupters T^1 and T^2. Upon making the experiment, the results were as follows: Upon depressing K^1, the reed of R^1 was thrown violently into vibration, as had been anticipated, producing a musical tone similar in pitch to that produced by T^1, and R^2 was not sensiblyaffected save for a slight trembling, which was perceptible to the sense of touch. Upon depressing the key K^2, neither of the reeds R^1 and R^2 was thrown into violent vibration, but both were affected by a slight trembling, which could be felt with the finger. Upon depressing K^1 and K^2 simultaneously, the reed R^1 was thrown into violent vibration, but that of R^2 was not. The results were in accordance with the theory upon which my system of harmonic telegraphy was based, only upon the supposition that the reed of R^2 was not in unison with that of T^2.

"Upon placing my teeth against the frame to which the reed R^2 was attached, and plucking the reed with my finger, I clearly perceived that its pitch was different from that of its proper transmitter, T^2. I tried many experiments to tune the reed of R^2, and in the course of these experiments I remodeled the receiving instrument R^2, as shown in Fig. 3, and shifted the position of the reed upon its support, so as to make its free portion longer or shorter, in the attempt to cause its normal rate of vibration to correspond to that of its proper transmitter. I also made the free portion of the reed purposely too short, so that it should have a higher rate of vibration than that of its proper transmitter, and sought to lower its tone by weighting it with lumps of wax. During the course of these experiments, while I happened to leave the keys K^1 and K^2 simultaneously depressed, the idea occurred to place my ear against the receiving reed shown in Fig. 3, which was trembling perceptibly to the sense of touch, but which had not been properly adjusted, so as to correspond with its proper transmitter.

"Upon placing my ear against the reed, I heard two musical tones, the unisons respectively of those produced by T^1 and T^2, seemingly proceeding from that one reed. The reed of R^1, however, was vibrating with great violence in another part of the same room, producing a tone of similar pitch to that produced by T^1, so that I was uncertain whether that tone was produced from the instrument at my ear, or whether it had been mechanically communicated to my ear through the air from the receiver R^1. To test this point, I removed the receiver R^1 from the circuit, leaving R^2, which was then in the condition shown in Fig. 3, in circuit with the two transmitters T^1 and T^2. Upon placing my ear against the receiver R^2, I then clearly perceived two tones proceeding from it, which were similar in pitch to the tones produced by the transmitters T^1 and T^2, and different from that normally produced by the reed of R^2 when plucked by the finger. This experiment was made in Salem, Mass., during the month of November, 1873."

"Int. 20. Did you afterward in your ordinary operations in the vibrations of reeds, when used as receivers, avail yourself of the phenomena described in your last answer; and if so, to what extent and for what purpose? Ans. It was constantly my custom after November, 1873, to observe the feebly forced vibrations produced in the reed of a receiver by the action of a current interrupter of different rate from its own, by placing my ear against the reed. It was my usual method of ascertaining whether to shorten or lengthen the reed of the receiver. When the tone electrically produced was lower in pitch than that produced by plucking the reed by the finger, I lengthened the free portion of the reed, but when the forced vibrations were of higher rate than the free vibrations of the reed, I shortened the vibratory portion of the reed, and thus adjusted its pitch to correspond to that produced by its proper interrupter.

The observation by Mr. Bell, at that date, "of this phenomenon of the production in the receiving reed, of feeble, forced vibrations of the same rate as the rate of the circuit interrupter, but differing in rate from the more ample vibrations which took place when the impulses came with periods corresponding to the normal rate of the receiving reed," (p. 113,) is both interesting and important, since it involves the recognition by Mr. Bell, at that time, of the fact that a receiving reed, though having a definite normal rate of vibration, and therefore a positive pitch of its own, could yet be made to respond, though perhaps feebly, with a tone corresponding in rate of vibration to that of a transmitter of different pitch; and, moreover, this could occur while the receiving reed was also, at the same time, responding with another tone, at a different pitch, corresponding to the vibrations of another transmitter.

In a word, two facts of importance were thus made known. First, that a vibrating transmitting reed could force its rate of vibration upon a receiving reed normally of another pitch; and second, that a single receiving reed could thus be made to give forth simultaneously two tones, each differing in pitch, but corresponding severally to the pitch of each of two transmitters.

It is obvious that a knowledge of these facts afforded Mr. Bell additional equipment, not only for the work immediately in hand, but also in the effort in subsequent years to transmit articulate speech.

The impression might possibly be gained from a hasty reading of the passage last cited from Mr. Bell's deposition, that he had modified his former statement, previously quoted from his preliminary statement, regarding the measure of success achieved in November, 1873, when he said: "On pressing K^1 and K^2 simultaneously, R^1 was thrown into strong vibration, but R^2 was not affected. Having no means of tuning the plate, *I was unable to make R^2 respond to the vibrations of T^2.*" But while Mr. Bell incidentally details in his deposition various means for tuning the plate that were *tried* in November, 1873, he does not state that any of these trials were *successful*, but, on the contrary, the only expression of success, "and *thus adjusted its pitch* to correspond to that produced by its proper interrupter," is in his last answer, which by its terms was expressly limited to what occurred "after November, 1873," while in the preceding answer, which was limited to what occurred "during the month of November, 1873," the language is invariably that which indicates trial, attempt and effort, as distinguished from the use of any words signifying attainment or success. Thus, "I *tried many experiments* to tune the reed of R^2, and in course of these experiments I remodeled the receiving instrument R^2, as shown in Fig. 3, and shifted the position of the reed upon its support, so as to make its free portion longer or shorter, *in the attempt* to cause its normal rate of vibration to correspond to that of its proper transmitter. I also made the free portion of the reed purposely too short, so that it should have a higher rate of vibration than that of its proper transmitter, and *sought* to lower its tone by weighting it with lumps of wax."

It is clear, therefore, from the record, that at the close of November, 1873, while Mr. Bell had transmitted sounds capable of use as signals with a single transmitter and receiver, there is no statement that he had yet been able to construct an apparatus by which two or more sounds could be simultaneously transmitted, actually and practically, so as to be capable of use as signals in telegraphy.

It should be noted, however, that during the period mentioned, some actual progress in the direction of improvements in mechanical details had been effected; and it further appears that, at the same time, knowledge had been acquired by Mr. Bell of the utmost importance, regarding the previous labors and accomplishments of others in acoustic telegraphy and in the electrical transmission of sound.

Important mechanical advantages were secured by the substitution of metallic plates for the tuning-forks first employed, as the necessary changes of pitch, in their synchronous adjustment, could be much more readily effected with the plates than with tuning-forks.

III.

Mr. Bell states that "somewhere about November, 1873, an article entitled 'The Acoustic Telegraph,' published in 'The Wonders of Electricity,' led me to substitute steel plates for tuning-forks in my telegraphic experiments."

This article, published in English in 1872, is in the record (printed in the volume "Defendants' Exhibits in Molecular Case, stipulated into "Overland Cases,' page 54), and it reads as follows:

"Wonderful as are these achievements, the inventions in telegraphy have gone still further. To be able to transmit thought to a distance is a triumph which was formerly astonishing; but we are now accustomed to it, and continue to practice it without its creating the slightest wonder. To be able to transmit handwriting, and even drawings, appeared to be still more difficult; but this problem has also been resolved, and we now hardly wonder that this feat is accomplished by means so simple. Mankind ever requires a new stimulus to its curiosity, and already it is looking forward to the discovery of more marvels in telegraphy; some years hence, for all we know, we may be able to transmit the vocal message itself, with the very inflection, tone and accent of the speaker. Already has the acoustic telegraph been invented; the principle has been discovered, and it only remains to render the invention practicable and useful—a result which, in these days of science, does not appear to be impossible.

"Sound, of whatever kind, is produced by a series of vibrations, more or less rapid, which, setting out from a sonorous body, traverse the air, and reach our ear; just as a stone dropped into a pond throws off a succession of circular undulations or water rings, so a concussion, acting on the air, produces analogous vibrations, though they are invisible, and it is when these vibrations reach the ear that we become sensible of sound.

"An eminent scientific German, M. Helmholtz, has analyzed the human voice and determined its musical value. According to him each vowel is formed by one or more notes of the scale, accompanied by other and feebler notes, which are harmonics of these. He demonstrates that it is the union of all these notes that give quality to the voice. Each syllable is formed by the notes of the vowel, accompanied by different movements of the organs of the mouth. M. Helmholtz, reflecting upon this, thinks it would be possible to construct a human voice by artificially producing and combining the elementary sounds of which it is composed.

" This is not the place to discuss such theories, but if we grant that there is any truth in them, we can understand that the acoustic telegraph can be invented and can transmit the living voice. Already experiments have been made in this direction. A vibrating plate produces a sound and, according to the rapidity of the vibrations, these sounds are sharp or flat. At each of the vibrations the plate touches a small point placed in front of it, and this contact suffices to throw the current into line; when the plate ceases to vibrate and returns to its position of equilibrium, it no longer touches the metal point and the current is consequently interrupted. By this means is obtained a series of interruptions, more or less rapid, according to the sound, the current being thrown into the line and interrupted once for each of the vibrations. At the extremity of the line the current enters an electro-magnet, which attracts another vibrating plate of size and quality identical with the former. Attracted and repelled very rapidly, exactly and as rapidly in fact as the plate mentioned above, this second plate gives forth a sound which will have the same musical value as that of the other, as the number of vibrations per second is the same in both cases.

"Should this process be perfected, it will be possible to transmit sounds by means of the telegraph—to transmit a series of sounds, a tune, or spoken sentence, and conversation. This consummation has not, however, been yet attained. Many experiments have been made, the principle has been applied in divers ways, and everything makes us hope that we will yet arrive at a perfect system of acoustic telegraphy. Advances have been made very far upon the road to success.

" A series of vibrating plates, answering to the strings of a harp, has been arranged, each of which vibrates when struck by a particular sound, and sends off electricity, to create, at the end of the line, the same vibrations in a corresponding plate; or, in other words, to produce the same sound. This system, it must be admitted, is at least very ingenious. Experiments have been made in laboratories, that is to say, under conditions entirely favorable, and such as we would not often find in actual practice. Under these conditions a musical air has actually been successfully transmitted by this acoustic telegraph.

"All must admit that this is a promising beginning, but we must not make too much haste to exalt the miracle and to extol the advantages of the future machine, or to abandon ourselves to the indulgence in indiscriminate laudation on the strength of this new discovery. That would be a gross mistake and an injury to science. True scientific faith is doubt until the truth appears in uncontrovertible clearness. Care must be taken not to take for reality that which is merely a desire on our part. We must guard against all premature exaltation, because it weakens us in the search for truth, and because even one deception is cruel. Let us therefore give to doubt, to patience and to perserverance, the place which some too readily give to congratulation."

It would appear that Mr. Bell was led by this article, not only to substitute plates for the tuning-forks previously employed, but also to adopt another mechanical expedient, which enabled him to overcome the difficulties incidental to the use of mercury, in making and breaking the circuit, which had hitherto troubled him. As stated, "The oxidization of the mercury, too, was a source of great annoyance, and was only partially obviated by covering it with alcohol." In this article, instead of a mercurial, a metallic contact was described. "At each of the vibrations the plate touches a small point placed in front of it, and this contact suffices to throw the current into line; when the plate ceases to vibrate and returns to its position of equilibrium, it no longer touches the metal point and the current is consequently interrupted." Upon turning to the sheet of drawings attached to Mr. Bell's preliminary statement, in which the figures are presented serially in chronological order (C. Vol. IV, Exhibits, p. 993), it will be observed that in each of the first six figures the cup of mercury is invariably employed to make and break the circuit at each of the vibrations of the plate or tuning-fork; but that in Fig. 7, the cup of mercury is omitted, and there is substituted a metallic contact, to wit, a screw or post point with wire connections, operating like that mentioned in said article. In the descriptive matter of the statement (Id. p. 981) it is stated that " Fig. 7 shows another form of instrument constructed during November, 1873."

In the Harmonic Caveat (C. Vol. IV, Exhibits, p. 864) it is stated regarding Fig. III, the counterpart of said Fig. 7: "The apparatus shown in this diagram is similar to that illustrated by Fig. II, excepting that the steel plate P vibrates against the extremity of a screw S, instead of making and breaking contact with a mercury connection."

But these mechanical details of the plate, and of the metallic contact points, were but trifles compared with the value of the principles set forth, and the information afforded in that article.

First, there was the distinct and intelligent assertion of the actual possibility, and the hope, in the future, of the electrical transmission of speech. "Some years hence, for all we know, we may be able to transmit the vocal message itself, with the very inflection, tone and accent of the speaker. Already has the acoustic telegraph been invented; the principle has been discovered, and it only remains to render the invention practicable and useful—a result which, in these days of science, does not appear to be impossible." Again: "This is not the place to discuss such theories, (Helmholtz') but if we grant that there is any truth in them, we can understand that the acoustic telegraph can be invented, and can transmit the living voice." And again: "Should this process be perfected, it will be possible to transmit sounds by means of the telegraph, to transmit a series of sounds, a tune, or spoken sentence, and conversation. This consummation has not, however, been yet attained. Many experiments have been made, the principle has been applied in divers ways, and everything makes us hope that we will yet arrive at a perfect system of acoustic telegraphy."

Second, it is distinctly enunciated that "the principle has been discovered," "the principle has been applied in various ways." And this principle is very clearly stated. The fundamental law of nature which must be and is the basis of all possible transmission of sound, is first distinctly set forth.

"Sound, of whatever kind, is produced by a series of vibrations, more or less rapid, which, setting out from a sonorous body, traverse the air and reach our ear. Just as a stone, dropped into a pond, throws off a succession of circular undulations or water rings, so a concussion, acting on the air, produces analogous vibrations, though they are invisible; and it is when these vibrations reach the ear that we become sensible of sound."

The mode of utilizing this law in the reproduction of sound at a distance is then broadly stated.

"Many experiments have been made, the principle has been applied in divers ways, and everything makes us hope that we will yet arrive at a perfect system of acoustic telegraphy. Advances have been made very far upon the road to success. A series of vibrating plates answering to the strings of a harp, has been arranged, each of which vibrates when struck by a particular sound, and sends off electricity, *to create at the end of the line the same vibrations in a corresponding plate; or, in other words, to produce the same sound.*"

In the general mode of operation thus set forth, its fundamental *principle* to which all else is contributory, clearly appears, to wit, that as sound is produced by vibrations which, reaching the ear, create that sensation, to reproduce those vibrations at a distance is to reproduce the sound; or, to use the very language of the article, "to create at the end of the line the same vibrations in a corresponding plate," *is*, "in other words, to produce the same sound."

Moreover, the natural order of sequence of the necessary steps in the operation is clearly indicated. A particular sound "strikes" against a plate; this sets the plate into vibration, corresponding, of course, to the vibration which produces it; this vibration of the transmitting plate "sends off electricity," which creates at the end of the line the same vibrations in a corresponding plate, thus producing the same sound. The apparatus by means of which the vibrating transmitting plate was made to send off electricity upon the line had been already described in the article in the account of the earlier experiments. "At each of the vibrations the plate touches a small point placed in front of it, and this contact suffices to throw the current into line."

The apparatus by means of which the electricity thus sent forth upon the line was made to vibrate the receiving plate had also been described.

"At the extremity of the line the current enters an electro-magnet, which attracts another vibrating plate of size and quality identical with the former. Attracted and repelled very rapidly, exactly and as rapidly, in fact, as the plate mentioned above, this second plate gives forth a sound which will have the same musical value as that of the other, as the number of vibrations, per second, is the same in both cases."

It should be noted that a material advance was also indicated in another very important particular. There were employed transmitting plates, "each of which vibrates when *struck* by a particular sound, and sends off electricity, etc." In Helmholtz' apparatus and in the earlier experiments the transmitting tuning-fork or plate was the very source or generator of the sound transmitted. But in the apparatus last described in this article, sound itself, exterior to the mechanism, acting as the motive force, impressed upon the transmitter the requisite vibrations, which were reproduced in the receiver at the other end of the line.

Finally, the statement was made that, under favorable conditions, in the laboratory, "a musical air has actually been successfully transmitted by this acoustic telegraph."

In a word, in this article the purpose of the effort and the object to be attained were distinctly announced; the fundamental principle was clearly stated; the successive steps severally indispensable to the application of the principle were specified in the natural order of their sequence; the means or apparatus employed was described; the advances already made upon these lines were detailed, while at the same time it was frankly stated that the consummation of actually transmitting speech, had not yet been attained, but remained a matter of "hope."

Mr. Bell, as we have seen, had long previously himself asserted, while yet in England, and as a result of his comprehension of Helmholtz' work, that, though he had no thought of applying himself to the task, somebody, some time, might yet solve the problem of the transmission of speech by electricity, possibly by the further development of Helmholtz' ideas.

This article, with its pronounced assertion of the eventual possibility of transmitting speech by electricity, and indicating also the underlying principles and the lines along which the solution was to be sought, and with its valuable information regarding the advances already made, must have been profoundly interesting to Mr. Bell, at that time and in confirmation of his previous views. He must also have seen, even at that early date, that a solution of the problem, if it was to be effected upon the lines and principles indicated, was closely collateral to the lines upon which he, himself, was working in the effort to accomplish multiple telegraphy. We need not be surprised if, shortly thereafter, it should appear that it became with him a subject for thought, incidental to the work upon which he was engaged; nor, if it should subsequently appear that he took up the work in earnest, exactly where it was left in this article, and carried it forward upon the same fundamental principles, but with the introduction of new principles of improvement in the subordinate steps.

We are confident that no substantial detail, appearing in the record, relating to or even throwing any light upon the history and progress of Mr. Bell's electrical and acoustical work, up to the end of November, 1873, has been omitted in the foregoing statement.

IV.

THE SECOND STAGE.

We have seen that at this time Mr. Bell had encountered the serious practical difficulty, in the development of his system of multiple telegraphy that in the plan upon which he was working "communications could be sent in only one direction."

This was a defect that must be remedied, and he saw that "one wire would suffice for communications simultaneously in both directions, if free earth communication could be secured at each end of the line."

Having become convinced "that the problem could not be solved by any arrangement of artificial resistances" he was for a time "at a loss how to overcome the difficulty."

But at length a modification of the method previously employed occurred to him which he conceived might possibly overcome the difficulty. Stated in his own language, it was as follows: "The means I proposed to employ for transmitting musical signals simultaneously in both directions along the same circuit, was to induce an intermittent current upon the line wire, by opening and closing, with extreme rapidity, the primary circuit, of an induction coil the secondary wires of which were in circuit with the line." (C. Vol. IV, Exhibits, p. 998.)

The particulars of this conception are given in detail in Mr. Bell's Preliminary Statement in Harmonic Interferences, in immediate connection with the passages already cited· (C. Vol. IV, Exhibits, p. 982.)

"Early in December, 1873, it flashed across me that the intermittent current might be induced upon the line wire, in which case there would be no difficulty in having free earth communication at both ends of the circuit.

"The arrangement as conceived is shown in Fig. 11. I saw also that the duplex principle could be applied as in Fig. 12, so as to double the number of messages possible upon the acoustical plan. I felt that the time had come for seeking assistance in carrying out the plan.

"My own circumstances prevented me from taking any pecuniary risks in attempting to bring out the system here. I therefore contented myself with working quietly at the theoretical details of the invention, trusting to the future for assistance.

"I came to the conclusion that a single battery would work a large number of transmitting instruments, as the steel plates, in vibrating, made and broke contact at different rates of speed, and for the same reason that each transmitter would act with the full power of the battery, even if all should be worked simultaneously.

"I also speedily decided that a single induction coil would answer for all the transmitters at each station, as shown in Fig. 13. The application of the duplex principle, by doubling the induction coil, is shown in Fig. 14.

"During the summer of 1874, doubts occurred as to the operation of the induced current. When the primary circuit of an induction coil is closed, a momentary impulse of positive electricity is induced upon the secondary circuit, and when it is opened an impulse of negative electricity appears upon the secondary wire. I feared that the induced current would be insufficient to set the armatures of the receiving instruments in vibration, unless the negative impulses, come exactly midway between the positive impulses and unless armatures of the receiving instruments were rendered permanently magnetic so as to be alternately attracted and repelled by their electro-magnets. The thought occurred of inducing the impulses by means of a permanent magnet, instead of a battery.

It is obvious that the foregoing purports only to be a narration of the mental conceptions and conclusions arrived at by Mr. Bell, during this period, when he was devoted to the study of the theoretical development of the details of the the invention.

This intent of the statement is made clear by the terms of the language invariably employed. Just previously he had stated:

"I therefore from this time (November, 1873), devoted less time to practical experiment than to the theoretical development of the details of the invention," while the language now employed is: "Early in December, 1873, it flashed across me that the intermittent current *might be* *induced* upon the line wire, etc." "The arrangement *as conceived* is shown in Fig. 11. I *saw* also that the duplex principle *could be* applied as in Fig. 12, etc."

But it must be noted here, that if we turn to Mr. Bell's deposition given nearly three years later than the date of the foregoing statement, and take up the narration where it was left at the last citation from that deposition (C. Vol. I, p. 113), a somewhat different impression is produced by the language employed.

"Int. 21. How early did you arrange your multiple telegraph instruments with an induction coil placed between the interrupter and the receiver? Ans. In the winter of 1873; I think about December.

"Int. 22. State whether the drawing now shown you is a correct representation of the manner in which you arranged the apparatus with an induction coil, and state when and for what purpose this drawing, Figs. 4, 5 and 6 was made? Ans. Figs. 4 and 5, represent correctly the manner in which I arranged the apparatus with induction coils, in December, 1873, and Fig. 6 represents an improvement of the arrangement, devised about the commencement of the year 1874. This drawing, Figs. 4, 5, and 6, was made previously to April 27, 1876, and formed part of the illustrations of my preliminary statement in the harmonic-telegraph interference before referred to. (Fig. 4 corresponds to Fig. 11, Fig. 5 to Fig. 12, and Fig. 6 to Fig. 13.

Any possibility of question in the matter is, however, rendered impossible by the testimony given during the cross-examination, as follows:

"Cross-Int. 225. Did you practically try the arrangement which you so conceived in December, 1873, for inducing the intermittent current on the line wire? A. I did not at that time.

"Cross-Int., 226. At what time did you? A. I made numerous experiments with induction coils in the winter of 1874 and 1875; but I can not be certain that the full arrangement of circuit shown in Fig. 4 was tried, but I believe it was; I, at all events, remember experimenting with a single induction coil, having an interrupter and receivers arranged as in Fig. 4, and I remember changing the interrupter, substituting for it an interrupter of different rate of vibration. The point I am uncertain about is as to whether a number of induction coils were used, as in Fig. 4. The arrangement shown in Fig. 5 was not tried. I can not fix the dates of these experiments otherwise than the winter of 1874 and 1875. They might have been as early as the 1st of November, 1874." (C. Vol. II., page 188.)

V.

We next come, in order of time, to a most interesting part in the history, to wit, the narrative by Mr. Bell of the train of reasoning by which he was led to the conception of the employment of the magneto-electric current, and also of the circumstances under which he conceived of the "harp apparatus" for transmitting sound.

It is somewhat remarkable that, as stated by Mr. Bell, this train of reasoning had its origin or beginning in the very "doubt" or fear regarding the possible operation of the intermittent induced current already mentioned.

Accounts of the conception of the harp apparatus given by Mr. Bell appear in the record in his London Lecture, (C. Vol. IV, Exhibits, p. 896); in his Preliminary Statement in Harmonic Interferences (C. Vol. IV, Exhibits, p.984); in his Preliminary Statement in Speaking Telephone Interferences (C. Vol. IV, Exhibits, p. 998), and in his deposition (C. Vol. I, p. 118).

The chain of reasoning by which Mr. Bell states that he was led up to the conception, is given with the fullest detail in his Preliminary Statement in Speaking Telephone Interferences, as follows:

"In developing my plan of multiple telegraphy, certain difficulties made their appearance, and I devoted myself during a summer vacation spent in Canada, in 1874, to devising means to overcome these difficulties and also to devising new methods of studying sound optically, as aids in teaching articulation to the deaf. The means I proposed to employ for transmitting musical signals simultaneously in both directions along the same circuit was to induce an intermittent current upon the line wire, by opening and closing with extreme rapidity the primary circuit of an induction coil, the secondary wires of which were in circuit with the line.

"Upon reasoning out the effects produced I saw that a current in one direction would be induced in the secondary circuit when the primary circuit was closed, and a current in the other direction when it was opened, and I feared that the alternate positive and negative impulses would be insufficient to set my receiving instrument into musical vibration, unless these impulses, which acted upon the plate or spring, were at equal intervals apart, and the plate or spring which constituted the armature of the receiving electro-magnet was itself permanently magnetic, so as to be attracted and repelled, as the pole of the electro-magnet was changed by the reversal of the current.

"To make this plate permanently magnetic I proposed to attach it to one pole of a permanent magnet.

"It then occurred to me that if this magnetic vibrating plate or armature were set in motion mechanically, it would induce positive and negative currents like those which I had proposed to send through the instrument to set the armature in vibration; I then saw that two similar instruments might be placed in a circuit, and that the vibration in the armature of one would produce corresponding vibration in the armature of the other; and if the vibration of the armature of the inducing instrument was such as to produce a musical tone, the corresponding vibration of the other armature would produce the same musical tone.

"It will be understood, of course, that both armatures were to be tuned to the same pitch.

"I then conceived the plan of attaching a number of springs, of different musical pitch, to each pole of a permanent horse-shoe magnet, so that the two sets of springs should lie in parallel planes; between the ends of these springs, which by their attachment to the permanent magnet became themselves magnets, an oblong electro-magnet was to be placed. The vibration of any one or more of the springs would induce corresponding electric currents in the electro-magnet when its circuit was closed, and if a second similar instrument was placed in the circuit I conceived that the armatures of this instrument would vibrate which corresponded in pitch to those which were vibrating in the first instrument, and would give out the same musical tones.

"It then occurred to me that not only would the armatures of the second instrument respond to notes of similar pitch, but that the loudness of the sounds produced would be dependent upon the amplitude of vibration of the armatures of the first instrument, for the strength of the electrical impulses produced by the armatures of the first instrument would depend upon the amplitude of their vibration, and the amplitude of the vibration of the armatures of the second instrument would depend upon the strength of the electrical impulses; hence, if a number of armatures of the first instrument were to be set simultaneously in vibration with different relations of force, the corresponding armatures of the second instrument would be thrown into vibration with corresponding relations of force.

It at once occurred to me that the results obtained by Helmholtz in the reproduction of vowel sounds might be obtained by this instrument. Helmholtz obtained his effects by causing tuning-forks of different pitch to vibrate simultaneously, increasing the loudness of the sounds by external re-enforcement by means of resonators. It seemed to me that the same result could be obtained by causing the armatures of my instrument to vibrate with greater or less force, and that this could be done by simply uttering a sound in the neighborhood of the first instrument. When a sound is uttered in the neighborhood of a musical instrument, like a piano or harp, each vocal sound is analyzed by the instrument into its component musical elements, and those strings of the piano or harp which correspond in pitch to the fundamental and overtones of the sound are thrown sympathetically into vibration by the action of the air, and the relative amplitudes of the vibrations of the different strings correspond to the relative loudness of the fundamental and overtones of the sound. Hence, I conceived that if a sound should be uttered in the neighborhood of the first instrument, certain of the armatures, corresponding in pitch to the fundamental and overtones of the sound uttered, would be thrown into vibration with the proper relations of force, and the armatures of the second instrument, corresponding in pitch to the fundamental and overtones uttered, would be thrown into vibration with corresponding relations of force, and would thus produce a sound having the same components as the original sound. Reflecting upon this arrangement and its likeness to the internal organ of hearing in the human ear, known as Cortis' organ, convinced me that if we could have a multitude of armatures, comprehending the whole scale of musical sounds audible to the human ear, the successive notes being so close together as only to differ infinitesimally from one another in pitch, then upon speaking to such an instrument the consonant and vowel sounds affecting the armatures of the first instrument would be reproduced by the armatures of the second instrument. In fact, sounds or noises of any kind made in the neighborhood of the first instrument would be reproduced by the second instrument.

"All these reflections occurred during this visit to Canada in the summer of 1874."

The form of the theoretical construction of the apparatus is described in the Preliminary Statement in Harmonic Interferences, as follows:

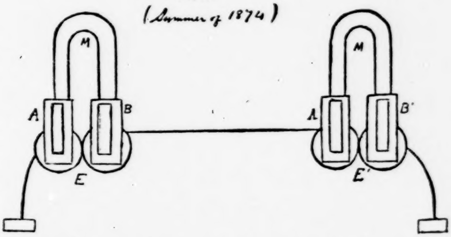
"During the summer of 1874, doubts occurred as to the operation of the induced current. When the primary circuit of an induction coil is closed, a momentary impulse of positive electricity is induced upon the secondary circuit, and when it is opened an impulse of negative electricity appears upon the secondary wire. I feared that the induced current would be insufficient to set the armatures of the receiving instruments in vibration, unless the negative impulses came exactly midway between the positive impulses, and unless armatures of the receiving instruments were rendered permanently magnetic, so as to be alternately attracted and repelled by their electro magnets. The thought occurred of inducing the impulses by means of a permanent magnet instead of a battery."

"When a permanent magnet is caused to approach the pole of an electro-magnet, a current of electricity is induced in the coils of the latter; and, when it is made to recede, a current of opposite polarity to the first is induced in the electro-magnet. The vibration, then, of a permanent magnet, in front of the pole of an electro-magnet, would produce an oscillating current in the coils of the latter; and the reversed impulses be at equal distances apart.

"The form which this idea took at this time (summer of 1874), is shown in Fig. 15.

FIG 15

(Summer of 1874)



"A B, A^1 B^1 are steel reeds attached to permanent magnets M M,^{1} vibrating by wind in front of the poles of electro-magnets, E E.^{1} A and B were to be of different pitch, and A^1 B^1 to be their counterparts, respectively. When A should be made to produce its musicalnote,

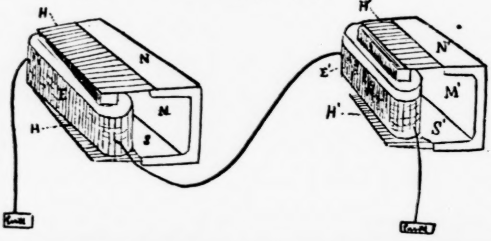
A^1 (its unison) would be thrown into vibration; for, when A moved downward, the current induced upon the circuit would cause the poles of the electro-magnet E^1 to be of opposite polarity to A^1 and B,^{1} and therefore A^1 would be attracted downward; but, when A should move upward, the polarity of E^1 would be the same as A,^{1} and therefore A^1 would be repelled. As the normal rate of vibration of A^1 coincides with that of A, the former would respond to the latter's vibration, and *vice versa*, but neither B nor B^1 would be affected.

"Reflection led me to believe that this idea was very valuable, as the currents induced in the coils of the electro-magnets E E^1 would correspond exactly to the effects produced in the air by the passage of a musical note. The polarity of each induced impulse would depend upon the direction of the motion of the permanent magnet A, to or from the pole of the electro-magnet under it, and hence would correspond to a condensation or rarefaction of air. The succession of induced impulses would be at the same rate per second as the vibrations of A, hence would correspond to the pitch of the note produced; and the intensity of each impulse would depend upon the extent or amplitude of the vibrations of A, and would correspond to the loudness of the resulting note.

"The idea gradually developed, that notes differing in loudness as well as pitch could be simultaneously transmitted, and as a corollary, the feasibility of the transmission of the timbre or quality of a sound suggested itself; for according to Helmholtz' theory, the quality of a sound depends upon the simultaneous production of a number of musical notes differing from each other in pitch and loudness. In each sound the fundamental or lowest tone is the loudest, the overtones being comparatively weak and faint.

"The apparatus shown in Fig. 16 was conceived as a means of transmitting vocal utterance telephonically.

FIG. 16 (Summer of 1874)



"Steel rods were to be attached at one end to the poles N. S, of a permanent magnet M, as in Fig. 16. An electro-magnet E, was to be placed between the two sets of rods H. H. An exactly similar instrument H¹ H¹ was to be placed upon another part of the circuit.

"Upon uttering a sound in the neighborhood of H, it was presumed that certain rods would be set sympathetically in vibration by the voice. The rod corresponding to the fundamental tone would vibrate forcibly, and those corresponding to the overtones of the sound would respond faintly. Each rod partaking of the polarity of the pole N or S, to which it was attached, would induce in the coils of the electro-magnet E, a series of electrical oscillations corresponding in rate per second to the number of its vibrations, and in intensity to the amplitude of its motion. The electrical impulses traversing the coils of the electro-magnet E¹ would cause vibrations in the corresponding rods H¹ H¹. The unison of the fundamental tone would respond loudly; and the rods corresponding in pitch to the overtones would vibrate feebly. Although the absolute loudness of all the sounds produced by the rods H¹ H¹ would be very faint, still the relative loudness of the notes would be preserved; and herce, theoretically, a repetition of the sound uttered in the neighborhood of H H, should proceed from H¹ H¹.

"Fearing that ridicule would be attached to the idea of transmitting vocal sounds telephonically, especially by those who were unacquainted with Helmholtz' experiments, I said little or nothing of this plan. Indeed, reflection convinced me that, however feasible the scheme looked upon paper, it was impracticable, as the induced currents would be far too feeble to overcome any great resistance. For the same reason the plan shown in Fig. 15 seemed impracticable save in theory; and I began to look about for some other method of inducing alternate positive and negative impulses which should succeed each other at equal intervals of time; and at last I hit upon the plan of making and breaking contact by means of a revolving cylinder, as shown in Fig. 17."

We are now enabled, from the data given in the foregoing statements, to arrive at a very clear comprehension of the mental processes and the general course of reasoning through which Mr. Bell's mind passed during the period mentioned.

In the first instance, he was confronted by the fact that there was a serious defect inherent in the plan upon which he had been working in the development of the multiple telegraph.

This plan involved the use of a battery current, which could be employed in connection with constant earth communication at one end only of the line. Messages, therefore, could be sent in only one direction, to wit, toward the end having free earth communication.

In considering this difficulty, it at length flashed across him that if, instead of throwing the battery current directly upon the line, an intermittent current could be *induced* thereon, there would then be no difficulty in having free earth communication at both ends of the circuit. In such case the entire circuit, from end to end and through the earth, would never be broken, and each "impulse" induced thereon would pass through every station, whatever its relative direction on the line.

It was a well known law of electricity that when the primary circuit of an induction coil is closed, a momentary impulse of positive electricity is induced upon the secondary circuit, and when it is opened an impulse of negative electricity appears upon the secondary wire.

The means which he proposed to himself to employ, in the application of this law, was to induce an intermittent current upon the line wire, by opening and closing with extreme rapidity the primary circuit of an induction coil, the secondary wires of which were in circuit with the line.

But here again theoretical difficulties were encountered. In the former plan, with the battery current thrown directly upon the line, the current was uniform in polarity and continued upon the line during the entire closing of the circuit. Consequently the electro-magnets in the receivers upon the line retained their attractive power as long as the circuit was closed, and were also constant in their polarity.

But in the new plan the alternate opening and closing of the primary circuit induced in the line wire, alternately, positive and negative impulses, which were, however, only momentary in duration.

In consequence the electro-magnets in the receivers upon the line would only be energized so as to attract their armatures during an instant of time.

Upon reasoning out these effects, he saw reason to fear that the alternate positive and negative impulses would be insufficient to set the receiving instrument into musical vibration, unless these impulses should come at equal intervals, and unless the plate or spring which constituted the armature of the receiving electro-magnet was itself made permanently magnetic, so as to be attracted and repelled as the pole of the electro-magnet was changed by the reversal in polarity of the current.

In order to make this plate permanently magnetic, he proposed to attach it to one pole of a permanent magnet.

As Mr. Bell has stated in his patent, it had "long been known that when a permanent magnet is caused to approach the pole of an electro-magnet, a current of electricity is induced in the coils of the latter, and that when it is made to recede a current of opposite polarity to the first appears upon the wire."

The brilliant thought at once occurred to Mr. Bell that this law could be made available for his purpose by simply providing a transmitter with an electro-magnet, and with an armature which could be set in vibration mechanically, at a definite rate. These very vibrations, by inducing upon the line alternately positive and negative currents, would then set the receiving armature into corresponding vibrations.

This was exactly what he wanted, as the line circuit would, upon this plan, always remain complete and unbroken, and the required free earth communication would be secured at both ends of the line. Moreover, the working of these instruments upon the line would be such as to produce effects perfectly adapted to meet the requirements of multiple telegraphy. As illustrated in Fig. 15: "When A should be made to produce its musical note, A^1 (its unison) would be thrown into vibration; for when A moved downward, the current induced upon the circuit would cause the poles of the electro-magnet E^1 to be of opposite polarity to A^1 and B,^{1} and therefore A^1 would be attracted downward; but when A should move upward, the polarity of E^1 would be the same as A,^{1} and therefore A^1 would be repelled. As the normal rate of vibration of A^1 coincides with that of A, the former would respond to the latter's vibration, and *vice versa*, but neither B nor B^1 be affected."

By mental processes, which not only evinced a thorough knowledge of the fundamental principles of electricity, but abilities of a very high order in theoretically applying those principles, and by a chain of reasoning which was clear, logical and without a flaw, he had at length arrived at the conception of a plan which wholly overcame the serious difficulty with which he had been confronted, and which at the same time afforded a theoretically perfect solution of the problem of multiple telegraphy.

And yet, strange to say, he utterly neglected "to lay hold of the promise," and though he had the means at hand in Boston, magnets, electro-magnets, vibrating armatures and a line wire, not till June 2, 1875, did he make the slightest test to determine whether this magneto-electric current would fulfill the required conditions.

This appears from Mr. Bell's own statements, upon cross-examination. (C. Vol. II, pages 1595–1607.)

"Cross-Q. 327. And when did you for the first time actually put together and experimentally operate the combination of instrumentalities as shown in figure 5 of said patent drawing (of the patent of March 7, 1876)? Ans. June 2, 1875."

"Cross-Q. 330. How long prior to June 2, 1875, had you had in your possession instruments substantially like the magneto receivers or transmitters shown in figures 5 and 6? Ans. The instruments shown in figures 1 and 3, pages 109 and 111 of my deposition (see *ante* page 13), I had in November, 1873, as there stated. I consider them substantially the same for the purposes of this question, though there are some differences of construction which I can explain if required. The instruments of figure 5 of the patent are improved forms of the same receiving instruments shown on pages 109 and 111 of my deposition. I should think that such instruments might be substituted for those shown in figures 5 and 6 of the patent, with substantially the same results."

"Cross-Q. 345. With two instruments in your possession, substantially such as shown at the ends of the circuit represented in figure 5 of the patent of March 7, 1876, and with a battery in your possession and wires for the transmission of the currents, how much time would it require to connect said two instruments by the wires, with or without the battery in the circuit, and pluck one of the reeds to ascertain whether the other would respond with an audible sound? Ans. A very short time if I had thought of trying the experiment in Boston, in Mr. William's establishment, where the instruments were kept; but a much longer time if the experiment had occurred to me in Salem, Massachusetts, where I was there residing, a distance of about eighteen or twenty miles from Boston.

"Cross-Q. 346. I suppose you mean it would have taken a longer time to get to and from the instruments, but not a longer time when you were in their presence, do you not? Ans. Certainly.

"Cross-Q. 347. Inasmuch as you had in your possession the instruments, the wires, and the battery, the experiment could have been made at any time from the summer of 1874 to June 2, 1875, when you happened to be in the presence of the instruments, without the expenditure of one penny of the capital of yourself, Mr. Hubbard, or Mr. Sanders; could it not? Ans. I think so, although the instruments in my possession in the autumn of 1874, being of my own construction, I felt were too roughly made for me to obtain from them even the results intended for the purposes of multiple telegraphy as satisfactorily as from similar instruments properly made. The first instruments made by a skilled mechanic, in the winter of 1874, were not so suitable for the purposes of the experiment referred to in the question."

The remarkable fact that Mr. Bell did not even think of trying the experiment, no longer appears to us strange, when we comprehend the fact that, all this time, it was also his absolute conviction that these induced magneto-electric currents would be far too feeble to overcome any great resistance, and so, indeed, exceedingly weak that no useful effect would be produced by them.

He turned his attention to other modes of working out his plan of multiple telegraphy, and at last hit upon the plan of making and breaking contact by means of a revolving cylinder, as shown in Fig. 17.

VI.

But it is not at all surprising, in the light of the previous history, that just at this point Mr. Bell, for the first time in his life, so far as we have any record, addressed himself, personally, to the theoretical solution of the problem of the electrical transmission of speech. Nor is it remarkable that almost immediately he arrived at a conception of a complete apparatus, with which he proposed to effect the solution.

He had been taught in the article on the acoustic telegraph, which he had read but a short time previously, that there was a well founded hope that the problem would be solved eventually by somebody. He had there been shown that, unquestionably, the lines upon which the solution was to be sought lay alongside of the very lines along which he was proceeding toward the hoped for solution of the problem of multiple telegraphy.

He had been taught there also the fundamental principle of transmission, that, as sound is the sensation produced by vibration and is determined by the character of that vibration, to reproduce by electricity in a receiver the identical vibrations occasioned by a sound in a transmitter is to reproduce that sound.

In that article there had also been described to him an apparatus with which such a degree of success had been attained, in the practical embodiment of that principle, that a musical air had actually been reproduced in the receiver. As there stated: "A series of vibrating plates, answering to the strings of a harp has been arranged, each of which vibrates when struck by a particular sound and sends off electricity, to create at the end of the line the same vibrations in a corresponding plate; or, in other words, to produce the same sound. This system, it must be admitted, is at least very ingenious. Experiments have been made in laboratories, that is to say, under conditions entirely favorable, and such as we would not often find in actual practice.

Under these conditions a musical air has actually been successfully transmitted by this acoustic telegraph."

It had been found impossible, however, to transmit speech through that apparatus. Sounds varying in pitch had been thus transmitted, but nothing more. Sonorous vibrations had been reproduced, which corresponded in *rate* with the original vibrations, but neither in *amplitude*, or in any other respect. So much had been accomplished, however, that it was obvious that success was to be obtained, not by a departure from the principle, but by an improvement in the apparatus, which should secure a more perfect application of the principle, and that, therefore, the work must be carried forward, if at all, in precisely this direction.

Mr. Bell had been led by a chain of reasoning arising out of the exigencies of his work upon the multiple telegraph, to an intelligent comprehension of the theoretical working of the magneto-electric current. It now flashed across him that this current was precisely the instrumentality which, theoretically, fulfilled all the requirements recognized as necessary for the electrical transmission of speech.

It is evident from his statement that it became immediately apparent to him that there was a most wonderful adaptation in this induced current for use as an instrumentality in the proposed reproduction of speech by electricity.

His professional work had made him thoroughly familiar with acoustics and the recognized laws of sound propagation. He knew that sound is transmitted through the air by a rapid succession of alternate condensations and rarefactions, occasioned by the vibration to and fro of each particle of the air in aerial impulses or wave movements, and that the pitch of the sound is preserved by the constant and unaltered rate of these vibrations, while its loudness is always determined by their relative amplitude.

Reflecting upon these characteristics of the aerial sound vibrations, and comparing them with the essential qualities of the magneto-electric current, induced as proposed, he almost intuitively discerned the intimate correspondence between the impulses of current induced in the circuit by the sonorous vibration of the transmitting armature, and the pulsations or vibrations communicated through the contiguous air by the passage of the characteristic note of that armature. Thus, fundamentally, the very constitution of this "oscillating current," made up of a continued succession of "reversed impulses," flowing in opposite directions upon the circuit, was seen to correspond exactly to the essential constitution of the aerial movement which takes place in the transmission of a sound, with its characteristic to and fro motion of the air particles in alternate condensations and rarefactions.

As he states: "The currents induced in the coils of the electro-magnets E E^1, would *correspond exactly* to the effects produced in the air by the passage of a musical note. The polarity of each induced impulse would depend upon the direction of the motion of the permanent magnet A to or from the pole of the electro-magnet under it, and hence would correspond to a condensation or rarefaction of air."

This correspondence to a condensation or rarefaction of air was indeed wonderful, leading to an almost absolute perfection in theory. Let a sound, for example, in unison with the characteristic note of a magnetic transmitting armature or plate, be uttered in the vicinity of that plate, and the aerial impulses traversing the air in the transmission of that sound, by their two-fold action upon the plate, actually set it into vibration (a fact noted by Mr. Bell in the very opening of his statement C. Vol. IV, Exhibits, p. 977). Each condensation advancing till it comes into contact with the surface of the plate, pushes it away by its superior pressure, or seemingly repels it, while the instantly following rarefaction, creating a partial vacuum before the surface of the plate, occasions, for the moment, a superior pressure upon its opposite side, and thus exerts a pulling or seemingly attractive force upon the plate. The interplay of the two forces, acting in opposite directions, causes a complete vibration of the plate.

It is fundamental in acoustics that these condensations and rarefactions are always associated together, in rapid alternations or "pulses," in the aerial propagation of a sound. Nowhere is there any distinction made, either as to their relative importance or as to the comparative degree of force actually occasioned by either, in their joint production of a complete vibration.

The to and fro movements of the air particles, constituting a sound vibration, are equal in extent, and the resulting condensations and rarefactions, forming a sound wave, vary equally in degree from the normal density of the air, and consequently are equally potent in impressing upon the plate a "sympathetic vibration." *

---

*NOTE.—"When a sounding body causes another body to emit sound, we have an instance of a very remarkable phenomenon called *resonance*. The German term for it, "co-vibration" (Mitschwingung), possesses the merit of at once indicating its essential meaning, namely, the setting up of vibrations in an instrument, not by a blow or other immediate action upon it, but indirectly as the result of the vibrations of another instrument."

"Suppose a heavy weight to be suspended from a fixed support by a flexible string, so as to form a pendulum of the simplest kind. In order to cause it to perform oscillations of considerable extent, by the application of a number of small impulses, we proceed as follows: As soon as, by the first impulse, the weight has been set vibrating through a small distance, we take care that each succeeding impulse is impressed *in the direction in which the weight is moving at the time*. Each impulse, thus applied, will cause the pendulum to oscillate through a larger angle than before, and, the effects of many impulses being in this way added together, an extensive swing of the pendulum is the result."

"For the sake of simplicity, let us suppose that we are dealing with a *second's* pendulum; *i, e.*, one of such a length as to perform one complete oscillation in each second, and therefore to make a single forward or backward swing in each half-second. It will be clear, from what has been said above, that the most rapid effect will be produced on the motion of the pendulum, by applying a forward and a backward impulse respectively during each alternate half-second, or, which is the same thing, administering *a pair of to and fro impulses during each complete oscillation of the pendulum*. We have a simple instance of such a proceeding in the way in which a couple of boys set a heavily-laden swing in violent motion. They stand facing each other, and each boy, when the swing is moving away from him, helps it along with a vigorous push.

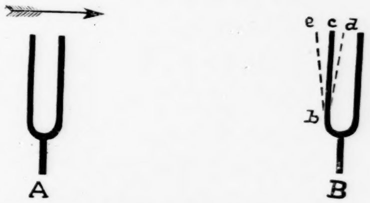
The above considerations enable us to explain how a sounding-fork excites the vibrations of another fork in unison with itself, through the medium of the intervening air. When a continuous musical note is being sounded, we know that, at any one point we choose to fix upon, the air is undergoing a series of rapid changes, becoming alternately denser and less dense than it would be were the sound to cease. The increase of density is accompanied by an increase of pressure; its diminution by a diminution of pressure.

Having thus clearly apprehended some of the simplest and most fundamental laws of acoustics, we can more thoroughly appreciate, as did Mr. Bell, the *exact correspondence* between these successive condensations and rarefactions, forming the aerial pulses which produce the sensation of sound, and the impulses of electricity induced in the circuit by the very vibrations these condensations and rarefactions set up in the magnetic armature plate.

Thus, when a continuous musical note is being sounded through the air, and the transmitting armature plate is vibrating in unison with it, at any aerial vibration we choose to fix upon, the impulse of condensation impinging upon the plate, by its pressure, co-acting with the elasticity or spring of the plate, pushes it toward the pole of the electro-magnet. This approach, or forward movement of the plate, induces in the coils of the electro-magnet and along the

---

Fig. 21.



Let A, Fig. 21, be the sounding-fork, B that whose vibrations are to be excited by resonance, and let us consider the effect of the alternations of pressure on the air at *c* on the prong *bc*. The increase of pressure will tend to move the prong into the position *bd*; its subsequent diminution will facilitate the elastic recoil of the fork, supported also by the superior density of the air on the other side of the prong, and thus tend to bring the prong into the position *be*, further to the left of its original position, *bc*, than *bd* was to the right of it. Thus the alternate condensations and rarefactions of the sound-waves impress on the fork B corresponding impulses in opposite directions.

One pair of such impulses is applied regularly during each complete vibration of B, since they are due to the vibrations of A, which is in unison with B. Further, for the small extent of vibration with which we have here to deal, the prongs of a tuning-fork move exactly according to the same law as a pendulum. Accordingly, these air-impulses are applied under precisely the conditions which we found to be most favorable to the rapid development of vibratory motion. The large number of such impulses which succeed each other in a few seconds make up for the feebleness of each by itself." *The Science of Music, or the Physical Basis of Musical Harmony.* By Sidley Taylor, M. A., Late Fellow of Trinity College, Cambridge. D. Appleton & Co., 1875, pages 58–60.

entire circuit, and in the coils of the electro-magnet in the receiver, an impulse of electricity flowing in one direction upon the line; its duration, or the interval of time occupied in its passage, is exactly equal to the duration of the impulse of aerial condensation, as represented by the endurance of the forward movement it imposes upon the plate; while its relative intensity is exactly proportionate to the relative extent of the impulse of condensation, as measured by the length of the movement traveled by the plate in that interval of time.*

The original impulse of aerial condensation is instantly followed by an equally pronounced impulse of rarefaction. This impulse, by the counter pressure it engenders upon the plate, co-acting with its elasticity or spring, impels it in the opposite direction and away from the pole of its electro-magnet. This recession or backward movement of the plate induces in the circuit, and in the coils of both the transmitting and receiving electro-magnets, an impulse of electricity flowing in the opposite direction from the first impulse, and likewise corresponding in duration and in relative intensity to the duration and relative length of the aerial rarefaction. As expressed by Mr. Bell in an analogous case: "The succession of induced impulses would be at the same rate per second as the vibrations of A, hence would correspond to the pitch of the note produced; and the intensity of each impulse would depend upon the extent or amplitude of the vibrations of A, and would correspond to the loudness of the resulting note."

As the aerial wave movement of vibration, made up of these impulses of forward and backward pressure, in succeeding condensations and rarefactions, is the precise force which produces the sensation of sound in the ear, the possible translation or conversion of that force into another form, which should, however, still preserve all its essential characteristics, but which could act at a distance in the reproduction of the original force with the same fidelity, was an idea which, as we have seen, reflection led Mr. Bell to believe was "very valuable."

---

*NOTE.—Int. 35. Why and how would the amplitude of the vibration of the transmitting reed control the amplitude of the vibration of the receiving reed? Ans. I understand from the well known laws of magneto-electricity that a current of electricity would be induced in the coils of the electro-magnet E, Fig 7 (15), when any one of the transmitting reeds A moved downward or upward, and that the strength of the current would be proportional to the velocity of the motion of the reed. I therefore inferred that as the velocity of motion of the reed was increased, that the strength of the current produced by the vibration was also increased. (C. 1, page 117, Bell.)

> "It then occurred to me that not only would the armatures of the second instrument, (in the proposed harp apparatus,) respond to notes of similar pitch, but that the loudness of the sounds produced would be dependent upon the amplitude of vibration of the armatures of the first instrument, for the strength of the electrical impulses produced by the armatures of the first instrument would depend upon the amplitude of their vibration, and the amplitude of the vibration of the armatures of the second instrument would depend upon the strength of the electrical impulses; hence, if a number of armatures of the first instrument were to be set simultaneously in vibration *with* different relations of force, the corresponding armatures of the second instrument would be thrown into vibration with corresponding relations of force."

The theory conceived was perfect in itself, as far as it went, but Mr. Bell was still restricted within the limitations of his knowledge at that time.

He knew that, "according to Helmholtz' theory, the quality of a sound depends upon the simultaneous production of a *number* of musical notes differing from each other in pitch and loudness. In each sound the fundamental or lowest tone is the loudest, the overtones being comparatively weak and faint."

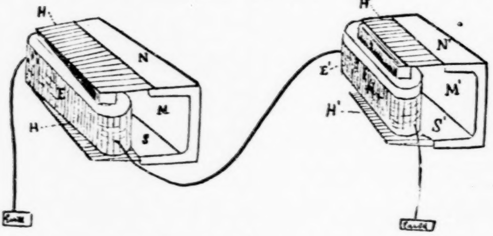
He knew also that, by the harp apparatus described in the article mentioned, in "*The Wonders of Electricity*," provided with its double series of vibrating plates, tuned respectively in unison, and placed one in the transmitter and the other in the receiver, that any number of musical tones could be transmitted and reproduced in the receiver, preserving however but the single quality of *pitch*. Reflecting upon the use of the induced magneto current, "the idea gradually developed that notes differing in loudness, as well as pitch, could be simultaneously transmitted, and as a corollary, the feasibility of the transmission of the timbre or quality of a sound suggested itself."

It appeared, therefore, to him that it would only be necessary to make percisely the same change in the transmitter of the harp apparatus described in that article that he had already planned to make in his multiple telegraph transmitter, to insure theoretically the successful transmission of speech.

A simple comparison of the descriptions of the old and the newly devised apparatus will show that this was exactly the form and the modification assumed in his conception.

Indeed, the description given in Baile's article applies very well to the drawing now made by Mr. Bell illustrating his conception, it being understood, of course, that in the former case there was a "make and break" in the current, instead of the induced current in an unbroken circuit, included in Mr. Bell's conception.

FIG. 16 (Summer of 1874)



"A series of vibrating plates, answering to the strings of a harp, has been arranged, each of which vibrates when struck by a particular sound, and sends off electricity, to create at the end of the line the same vibrations in a corresponding plate; or, in other words, to produce the same sound."

VII.

This consideration, however, by no means detracts from the high character of Mr. Bell's conception, which affords one of the finest examples of what Mr. Tyndall has termed the scientific use of the imagination, in dealing mentally with forces and movements that are unseen, but none the less real.

Mr. Bell, by a careful study of the fundamental laws of both acoustics and electricity, and by continued reflection upon their possible interplay and co-action, had arrived at a distinct intellectual recognition of the exact correspondence in movement and in every phase of that movement between the aerial impulses, which produce the sensation of sound and the electrical impulses, which they might be made to induce in a closed circuit.

Here was a possible instrumentality, the use of which was in perfect accord and directly in line with the fundamental principle upon which his predecessors had labored, to wit: the reproduction of the sound by the reproduction in the receiver of the identical vibrations imposed by the sound upon the transmitter. The instrumentalities previously employed were imperfect, inasmuch as they reproduced in the receiver vibrations which corresponded in rate only with the vibrations of the transmitter, and consequently reproduced the sound in the single quality of *pitch* alone; or, as expressed in Baile's article: "Attracted and repelled very rapidly, exactly and as rapidly in fact as the plate mentioned above, this second plate gives forth a sound which will have the same musical value as that of the other, as the number of vibrations per second is the same in both cases."

The new instrumentality would, theoretically, carry forward the work a long step in advance, for, from the essential character of its movement, it must reproduce in the receiver vibrations which would correspond with those of the transmitter in rate and in amplitude as well, so as to reproduce the sound in the qualities of both *pitch* and *loudness*.

The harp apparatus described in Baile's article was provided with a *series* of tuned vibrating plates in both transmitter and receiver, that a number of tones might be simultaneously transmitted in compliance with the requirements of Helmholtz's theory regarding the production of the *quality* of a sound as distinctly referred to in that article.

Mr. Bell also adopted this theory, which is presumably a correct one, so far as musical notes and vowel sounds are concerned. The only course available to him, in the light of the knowledge possessed by him at that time, was therefore to devise a simple re-arrangement of that harp apparatus so that it would operate by induction, instead of by a making and breaking of the circuit. He would thereby effect a substitution of the magneto-electric current for the interrupted battery current previously employed as the intermediate instrumentality.

But it must be noted here, as an important fact, that this apparatus, as conceived by Mr. Bell, still contained a radical defect which incapacitated it from ever becoming useful as a practical telephone. This defect, however, did not lie in the nature of the magneto-electric current to be induced in its operation, but it was inherent in the *mechanism* employed, both in the transmitter and the receiver.

Each of the steel rods, springs or armature plates, as Mr. Bell has respectively termed them, clamped at its extremity into the transmitter, was to be turned to a musical pitch, or dominant rate of vibration (C. IV, Exhibits p. 999), while the armature plates in the receiver were also to be tuned respectively in unison with the transmitting plates.

In consequence of this construction each plate, in both transmitter and receiver, would practically respond only to tones of its own pitch, so that sounds running through all those variations of tone lying between the standard pitches of any two successive plates, and which contribute so essentially to the quality of speech, could neither be taken in by the transmitter, nor, much less, be sounded forth by the receiver. Unless, indeed, in the language of Mr. Bell, "we could have a multitude of armatures, comprehending the whole scale of musical sounds audible to the human ear, the successive notes being so close together as only to differ infinitesimally from one another in pitch," which would obviously be wholly impracticable.

Even then, such steel rods or plates, tuned each to a particular note, so as to be in unison with its mate, when set into vibration, would give forth each a clear, musical tone, and their united effect would obviously be only combinations of musical tones. Musical airs could thus be transmitted; vowel sounds, which are essentially musical tones, might possibly be reproduced, but the consonants and the consonantal elements of articulate speech would find no adequate expression.

Mr. Bell, nine years later, in March, 1883, when the telephone and the necessary conditions of its practical construction were thoroughly understood, expressed himself regarding this subject as follows (C., Vol. II, p. 1699, X-Q 618):

> "For the purpose of reproducing *timbre* we want a combination that will vibrate as little as possible after a law of its own, and as much as possible after the law of the vibrations impressed upon it, so that substantially it has no tendency to vibrate after a law of its own, but will copy with substantial fidelity the form of the vibrations impressed upon it." And again (Id., p. 1669, X-Q 542): "A free-tuned reed, like that shown in Fig. 5, (of the patent) had a strong tendency to vibrate after a law of its own, and it was difficult to make it move at any other rate, or in any other manner, than that which was normal to it; but the mechanical structure of the apparatus, shown in Fig. 7, adapted it to vibrate with substantially equal freedom at all rates and in any manner, so that it could copy the shape or the form of any vibration. Now, the quality or *timbre* of a sound is characterized by the shape or form of the vibration that causes it, and hence no apparatus can reproduce *timbre* that is not capable of copying with substantial accuracy the form of a vibration."

This view regarding the requirements of the case is also adopted by counsel for complainants in their "Brief for

Complainants on Final Hearing" in the court below, page 43, as follows:

"As many messages can be transmitted (by Mr. Bell's harmonic telegraph), as there are notes, subject always to certain limitations due to the mechanical and electrical operations which have to be performed. This operation has not necessarily anything to do with the transmission of speech. It generally requires for its best efficacy contrivances which are fatal to the transmission of speech. But one style of instrument which Mr. Bell devised for the harmonic telegraph did have a novel kind of electrical device, which he afterward utilized in the speaking telephone.

"But he utilized it for the two purposes in a very different way and by very different kinds of contrivances. For the harmonic telegraph, as he made it, it was essential that each instrument should vibrate to its own particular pitch and none other, while the character or "*quality*" of the sound acting upon it or produced by it is of no consequence. For the speaking telephone it is essential that the instrument have, as nearly as possible, no note, no will of its own, but shall respond equally to all pitches, while the one essential thing is that it shall take note of the *quality* of the sound acting upon it, and copy that *quality* in the sound produced by it; and furthermore that the operating cause at the transmitting station which produces all the changes, shall be the sound waves themselves."

The fundamental principle upon which the original harp apparatus was based was demonstrably right. The new application of the induced current of electricity to its operation was also theoretically correct in principle; but defects in the mechanical construction of the apparatus as devised still rendered it imperfect and incomplete, and its successful use wholly impracticable.

This was clearly a case where the work of *invention* was still required before a practical telephone could be given to the world.

Mr. Bell himself seems, even at this time, not to have been altogether content with his conception, for we find that, still theorizing, he turned to the consideration of other possible appliances, which perhaps might be utilized to better advantage in inducing the magneto-electric current.

Continuing the narration as given in perhaps the clearest form in his preliminary statement, in Speaking Telephone Interferences (C. IV Exhibits, p. 1001), and commencing at the termination of the last quotation, he says:

"All these reflections occurred during this visit in Canada in the summer of 1874. At the same time, as I have already mentioned, I was making an optical study of sound for the purpose of exhibiting to the eyes of the deaf the shapes of the vibrations due to vocal sounds, so that they might compare these shapes with the shapes which they, in their own attempts to produce sounds, saw exhibited in the manometric flame of Kœnig.

"For that purpose I had taken with me to Canada a human ear, in hopes that I might be able to use the ear itself as a phonautograph, as suggested to me by Dr. Clarence J. Blake, of Boston, who kindly lent me the ear to experiment with. I have still in my possession a number of glass plates, with tracings of the vibrations of the human ear caused by uttering different vowel sounds. These tracings bear dates in July and August, 1874, which dates were made upon the plates at the time the tracings were taken.

"Studying these tracings in connection with Helmholtz's researches, I was led to see that they represented graphically the resultant vibration of the air caused by the fundamental and overtones of the voice. I was also struck with the fact that so small and delicate an organ as the membrane of the ear should be able, from the impulses of the air, to put in motion the comparatively large and massive bones contained in the tympanum.

"Helmholtz has pointed out that a graphical representation of the vibrations of the air caused by a simple musical tone, or in other words, a simple pendulous vibration, is a simple curve of a peculiar kind, called a sinusoidal curve, and that the graphical reresentation of the vibration of the air, caused by a sound of any other kind, is the resultant of a number of sinusoidal curves superposed, one upon the other, representing graphically the fundamental and overtones that go to make up the sound.

"I conceived in like manner that an analogous electrical effect would be produced upon the line wire between the first and second instruments previously described, caused by the superposition of currents due to the vibrations of the armatures corresponding to the fundamental and overtones of the sound uttered.

"I was thus led to the idea that a single armature might be put in motion in such a way as to produce directly a current which should correspond to the resultant current due to the vibration of the armatures, which would respond to the fundamental and overtones of the sound.

"The question then arose in my mind whether an armature might not be set in motion by a membrane similar in shape and structure to that in the human ear, so as to produce a current which should correspond to the vibrations of the air. I did not, at this time, devise any method of combining a membrane with an armature, or attempt to construct any apparatus upon the plans I had conceived.

"I never constructed the instrument which I have described, made up of a number of armatures attached to a permanent magnet and tuned to different pitches, and which I had devised with special reference to multiple telegraphy, because I thought that the currents which would be induced would be so exceedingly weak that no useful effect would be produced by them, corresponding to what I had theoretically attributed to them. I therefore turned my attention to other modes of working out my plan of multiple telegraphy, which I was thoroughly bent upon reducing to practice immediately. I did, however, explain to my father and to other friends in Canada, my ideas as they occurred. When I returned to Boston in September or October, 1874, being without means for prosecuting my experiments, I made arrangements with Mr. Sanders and Mr. Hubbard to furnish funds for the prosecution of my experiments, and to enable me to patent my inventions. At their earnest request, I devoted myself to the development of my system of multiple telegraphy, and applied for patents in the winter of 1874 and 1875.

"I did, however, shortly after my return from Canada, have several interviews with Dr. Blake, for the purpose of showing him the experiments I had made, and of obtaining further information with regard to the structure and mechanism of the human ear, to aid me in my efforts to devise a method of producing vocal sounds electrically; and we carried on, conjointly, a series of experiments to obtain tracings of the vibration of the bones of the human ear. At one of these interviews I explained to him the various plans which had occurred to me for multiple telegraphy and the transmission of speech, and I made a number of rude sketches in his presence, illustrating these plans. Among them is to be found a sketch of an instrument showing two free reeds or springs attached to the poles of a permanent magnet, and surrounded like harmonium reeds, with casings adapting them to be vibrated by wind. Another figure, on the same sheet, exhibits two horseshoe permanent magnets with their poles placed opposite each other, surrounded by helices forming part of an electric circuit. Between the poles of the magnets, vibrating reeds are placed, which were to be of steel. The mechanical vibration of these reeds would produce electrical currents alternately in one direction and the other, and varying in strength at different parts of the vibration of the reeds, so as to produce an undulatory current regular in point of time, but varying in strength during any single vibration of the reed, in proportion to the different velocity of the reed in the different parts of its path.

"On the same sheet is a representation of the instrument I have before referred to, when several springs were attached to the poles of a permanent magnet, having between them the poles of an elongated electro-magnet, over a portion of which each spring could vibrate.

"I am certain that I made sketches of these devices while in Canada, but I am unable to find any earlier than those given to Dr. Blake.

"I had an apparatus constructed for a receiving instrument, in which a free reed, to be set in vibration by an electro-magnet and produce a musical tone, was attached to the pole of a permanent magnet. This was in the winter of 1874 and 1875, and is described in one of my applications for patents made in February, 1875.

"While in Washington attending to this business I called upon Prof. Henry and explained all my inventions to him. His appreciation encouraged me very much, and he pronounced my plan for the electrical production of articulate speech the germ of a great invention.

"I recollect explaining to him the idea of an instrument with a number of armatures tuned to different pitches, which I have before described, and it was with reference to this apparatus that he made the above remark.

"He showed me the various electrical and acoustical instruments which he had in the Smithsonian Institute, including Reis' telephone. I had previously seen in the Institute of Technology, in Boston, the receiving instrument of Reis' telephone, and was acquainted with the construction of the whole apparatus by diagrams and printed descriptions; but I had never before seen the transmitting portion of the apparatus. We had some conversation about the mechanical power of stretched membranes. I can not recollect the details of it, but I remember that the effect of his remarks was rather discouraging as to my being able to obtain the results from a stretched membrane which I had hoped. I remember that the impression left upon my mind was that each stretched membrane would have a rate of vibration peculiar to itself."

The foregoing passage is a recital in concise terms of the circumstances under which Mr. Bell was led to make another important advance in the theoretical development of the proposed invention.

Helmholtz taught him that the vibration of the air particle caused by a simple musical note is a simple "pendulous" vibration; that its motion is governed by the same laws applicable to the pendulum movement.

(It is interesting to note that this had been mathematically demonstrated by Sir Isaac Newton in his *Principia*. His Proposition 47, Book III, is headed as follows:

"When pulses are propagated through a fluid, every particle oscillates with a very small motion, and is accelerated and retarded by the same law as an oscillating pendulum.'')

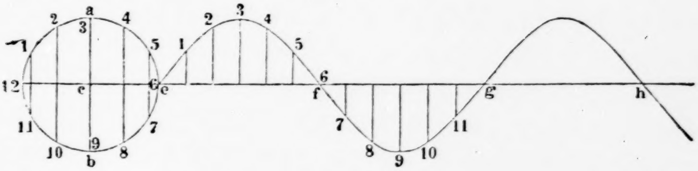
In accordance with these laws, for example, the vibrations of the air particles are all made in the same definite period of time, corresponding to the *pitch* of the tone, whatever might be the amplitude of the vibration. From the extremity of the vibration, the motion of the air particle, commencing, increases or accelerates till it comes to the middle, whence it diminishes till it ceases at the extreme limit upon the opposite side; when the return movement in reverse direction occurs with the same variations.

The *rate* of the increase or acceleration of motion in approaching the center, and of the decrease in departing from it, is greatest at the extremities and least at the center, where change is made from increase to decrease.

These characteristics determine mathematically the exact form of the curve which graphically represents the movement of any body or particle put into "pendulous vibration."

Helmholtz pointed out that this curve, which thus represents graphically the air vibration caused by a simple musical tone, is a simple curve of a peculiar kind, called a sinusoidal curve.

"The law of these vibrations (simple or pendular) may be popularly explained by means of the construction in Fig. 10.



"Suppose a point to describe the circle of which C is the center, with a uniform velocity, and that an observer stands at a considerable distance in the prolongation of the line e h, so that he does not see the surface of the circle, but only its edge, in which case the point will appear merely to move up and down along its diameter, a b. This up and down motion would take place exactly according to the law of pendular vibration. To represent this motion graphically by means of a curve, divide the length e g, supposed to correspond to the time of a single period, into as many (here 12) equal parts as the circumference of the circle, and draw the perpendiculars 1, 2, 3, etc., on the dividing points of the line e g, in order, equal in length to and in the same direction with, those drawn in the circle from the corresponding points 1, 2, 3, etc. In this way we obtain the curve drawn in Fig. 10, which agrees in form with that drawn by the tuning-fork, Fig. 6, p. 206, but is of a larger size. Mathematically expressed, the distance of the vibrating point from its mean position at any time is equal to the sine of an arc proportional to the corresponding time, and hence the form of simple vibrations are also called the *sine vibrations* [and the above curve is also known as the *curve of sines*."]

(Helmholtz's Sensations of Tone, page 23, note.)

Helmholtz also pointed out that any musical sound, being itself a resultant or composition made up from a fundamental and overtones, causes a vibration of the air which is represented graphically by a curve, which is also the resultant made up from the superposition of the several sinusoidal curves representing the constituent tones.

Mr. Bell, in the course of his practice with the phonautograph and his study of its tracings when a vocal sound was uttered into the instrument, was led to see and to appreciate the fact that these tracings represented graphically this resultant vibration of the air.

The value of this observation lay in the fact that, taken in connection with Helmholtz' researches, it showed that while the fundamental and overtones were actually transmitted together by the vibration of each air particle lying in the course traveled by the sound, the air particle itself passed through a singular definite motion, the resultant, mathematically considered, of the several motions characteristic of the fundamental and the overtones respectively.

Mr. Bell was thus led directly to the conception that in his proposed "harp apparatus," the electrical impulses induced upon the single line by the simultaneous vibration of a number of armature plates, each vibrating in a different manner, would coalesce each instant into a single resultant impulse, the duration, direction and intensity of which would be determined by the *algebraical* sum of the several impulses being induced upon the line at that instant by the vibrating plates. All the impulses that were being induced in one direction at the instant being added in their intensity, and likewise those being induced in the opposite direction, the resultant impulse would continue in the direction of the impulses whose sum was the greater, and with an intensity equal to the difference between the two sums. And the movement would continue in that direction until the balance between the two sums at any instant was reversed, when the resultant impulse would also be reversed in its direction. This electrical movement could therefore, be represented graphically by the curve which would be the *algebraical* sum or composition of the several curves representing the electrical movements induced by each of the vibrating plates. This would be in *exact analogy* to the character of the similar resultant movement of the air vibration and its graphical representation, as pointed out by Helmholtz.

The discernment of this wonderful correspondence between the movements of the proposed electrical impulses and of the sonorous air vibrations in the vital characteristics of duration, direction and intensity, led Mr. Bell directly to the perception that the same mathematical laws applicable to the aerial impulses were equally applicable to the induced electrical impulses.

This reasoning led Mr. Bell to a further conception of the greatest importance. With the proposed harp apparatus the sound, in accordance with Helmholtz' theory, would first be resolved into its constituent tones by the vibrations it imposed upon a series of plates of different pitch, and then the currents induced by these vibrations would in turn be recomposed into a single resultant current.

Mr. Bell accordingly conceived the idea that precisely the same *resultant* electrical current that would exist upon the line wire in the use of the harp apparatus might be induced directly by a *single* armature, provided it was put into motion corresponding to the "resultant motion" of the air particles in the actual transmission of the sound; or as expressed by Mr. Bell.

"I was thus led to the idea that a single armature might be put in motion in such a way as to produce directly a current which should correspond to the resultant current due to the vibration of the armatures which would respond to the fundamental and overtones of the sound."

With this last conception Mr. Bell had attained to a full and definite comprehension of the *principle* of his proposed method of transmitting speech by electricity.

Even the fine points in the theoretical development of this principle appear to have been closely apprehended by Mr. Bell. Thus, for example, Helmholtz had stated a general proposition regarding the physical basis of the "quality" of a sound as follows:

"On inquiring to what external difference in the waves of sound the different qualities of tone correspond, we must remember that the amplitude of the vibration determines the force or loudness, and the period of vibration the pitch. Quality of tone can therefore depend upon neither of these. The only possible hypothesis, therefore, is that the quality of tone should depend upon the manner in which the motion is performed within the period of each single vibration."

We find that this was recognized and provided for by Mr. Bell in the statement of the fact that these induced currents would conform to the required conditions by their exact correspondence to the varying movements of the armature within the period of each single vibration. Referring to the reed instruments, already described, sketches of which he showed to Dr. Blake, he pointed out this very characteristic as follows: "The mechanical vibration of these reeds would produce electrical currents alternately in one direction and the other, and varying in strength at different parts of the vibration of the reeds so as to produce an undulatory current, regular in point of time but varying in strength during any single vibration of the reed in proportion to the *different velocity* of the reed *in the different parts of its path.*"

VIII.

But, though the *principle* of the proposed method was definitely conceived and apparently thoroughly understood, the *invention* was by no means complete, even in theory; to say nothing regarding that practical embodiment of the principle in a working apparatus which must exist to constitute the actual completion of an invention.

There could be no transmission of articulate speech, even in theory upon his plan, until Mr. Bell had devised such an arrangement of a single armature that its movements would actually correspond to the resultant movements of the air vibrations in the transmission of sound.

This was indeed indispensible, and the very first requisite to enable the principle to be brought into play, by the induction of electrical impulses which would correspond to these air movements.

Here was a practical problem, and one by no means easy of solution.

One can not readily appreciate, at the present time, the perplexities and the difficulties which had to be encountered in devising, even theoretically, an arrangement of a single metallic armature, so that it would respond freely in movements actually corresponding, in every detail of motion, to each and every air vibration. It was not a question of mere adjustment or mechanical skill, for much more was involved, and so much that, though the principle should prove to be correct, and the electrical impulses adequate to the work, the faculty of *invention* would still have to be effectively exercised before the world could possess a practical working telephone.

A moments consideration will afford us a glimpse of the nature of the difficulty encountered.

Of course the armature must be a body capable of induction action and therefore metallic, preferably iron or steel. By reference to the drawings attached to his preliminary statement, it will be seen that every armature previously employed by Mr. Bell in his harmonic telegraph experiments, (always in the receivers in connection with "make and break" transmitters) had been *clamped* at one extremity, leaving the other end free for vibration before the electro-magnet. This clamping of the armature affixed upon it a certain definite normal rate of vibration, tuning it to one pitch, and, as he has repeatedly pointed out, it would respond only to vibrations of its normal rate and would remain silent and unresponsive to the influence of vibrations of a different rate.

This was a characteristic exactly adapted to the purposes of multiple telegraphy, and even there he found that it was necessary that both the vibrating circuit breaker and the armature in the receiver should be tuned to *exactly* the same pitch, or normal rate of vibration, in order to obtain any responsive sound from the receiving armature.

Obviously, then, this construction was wholly inadequate for the purpose of transmitting speech. It could only induce electrical impulses which would correspond in their movements to air vibrations of one particular rate, to wit, the normal rate of vibration of the armature. Its service would, therefore, be limited to the transmission of musical tones of one definite pitch, while the reproduction of articulate speech would still remain unaccomplished.

But this is only a marked exemplification of the real nature of the difficulty, out of which arose the perplexities of the case.

It is a familiar principle in acoustics that every body, whatever its form, has its own normal rate of vibration, due to its molecular structure, and varying according to its shape and the conditions of its arrangement. Even a body of air enclosed in a tube open at both ends has its normal rate of vibration determined by the relative length of the tube; and this property of the air is utilized in the arrangement of pipes in musical instruments. Discs and even diaphrams have, likewise, their normal rates of vibration, proportioned to their thickness and the degree of their tension.

It is also well known that this property is most persistent in the metals, especially iron and steel, owing to their greater density in connection with their elasticity. Again, the form or shape given to a metallic body has great influence upon the relative power and persistency of this force. This is exemplified in the case of the bell, which has been found to be of the form best adapted to intensify this quality. This property or force was a serious obstacle to the electrical transmission of articulate speech, *before it was successfully accomplished.* It was a necessity that an apparatus should be devised, which would enable the air particles, always feeble in their individual force, to actually *overpower* the molecular forces exerted, not only in resistance to any responsive movement of the armature, but, positively, to force this movement into a particular rate of vibration, a rate differing from the constantly varying rates successively sought to be forced upon it by the modulations of the voice in speaking.

It was a delicate problem, and, if ever there was one that called for the exercise of ingenuity, experiment and invention in its solution, this was a fair example.

We find that Mr. Bell at once addressed himself to the theoretical consideration of the problem, and we see evidences very quickly displayed that he thoroughly appreciated the inherent difficulties of the case. He had previously been "struck with the fact that so small and delicate an organ as the membrane of the ear should be able, from the impulses of the air, to put in motion the comparatively large and massive bones contained in the tympanum," and in studying the problem now presented, "The question then arose in my mind," he says, "whether an armature might not be set in motion by a membrane similar in shape and structure to that in the human ear, so as to produce a current which should correspond to the vibrations of the air."

He states, however, very frankly, "*I did not at this time devise any method* of combining a membrane with an armature."

statement, it will be seen that every armature previously employed by Mr. Bell in his harmonic telegraph experiments, (always in the receivers in connection with "make and break" transmitters) had been *clamped* at one extremity, leaving the other end free for vibration before the electromagnet. This clamping of the armature affixed upon it a certain definite normal rate of vibration, tuning it to one pitch, and, as he has repeatedly pointed out, it would respond only to vibrations of its normal rate and would remain silent and unresponsive to the influence of vibrations of a different rate.

This was a characteristic exactly adapted to the purposes of multiple telegraphy, and even there he found that it was necessary that both the vibrating circuit breaker and the armature in the receiver should be tuned to *exactly* the same pitch, or normal rate of vibration, in order to obtain any responsive sound from the receiving armature.

Obviously, then, this construction was wholly inadequate for the purpose of transmitting speech. It could only induce electrical impulses which would correspond in their movements to air vibrations of one particular rate, to wit, the normal rate of vibration of the armature. Its service would, therefore, be limited to the transmission of musical tones of one definite pitch, while the reproduction of articulate speech would still remain unaccomplished.

But this is only a marked exemplification of the real nature of the difficulty, out of which arose the perplexities of the case.

It is a familiar principle in acoustics that every body, whatever its form, has its own normal rate of vibration, due to its molecular structure, and varying according to its shape and the conditions of its arrangement. Even a body of air enclosed in a tube open at both ends has its normal rate of vibration determined by the relative length of the tube; and this property of the air is utilized in the arrangement of pipes in musical instruments. Discs and even diaphrams have, likewise, their normal rates of vibration, proportioned to their thickness and the degree of their tension.

It is also well known that this property is most persistent in the metals, especially iron and steel, owing to their greater density in connection with their elasticity. Again, the form or shape given to a metallic body has great influence upon the relative power and persistency of this force. This is exemplified in the case of the bell, which has been found to be of the form best adapted to intensify this quality. This property or force was a serious obstacle to the electrical transmission of articulate speech, *before it was successfully accomplished.* It was a necessity that an apparatus should be devised, which would enable the air particles, always feeble in their individual force, to actually *overpower* the molecular forces exerted, not only in resistance to any responsive movement of the armature, but, positively, to force this movement into a particular rate of vibration, a rate differing from the constantly varying rates successively sought to be forced upon it by the modulations of the voice in speaking.

It was a delicate problem, and, if ever there was one that called for the exercise of ingenuity, experiment and invention in its solution, this was a fair example.

We find that Mr. Bell at once addressed himself to the theoretical consideration of the problem, and we see evidences very quickly displayed that he thoroughly appreciated the inherent difficulties of the case. He had previously been "struck with the fact that so small and delicate an organ as the membrane of the ear should be able, from the impulses of the air, to put in motion the comparatively large and massive bones contained in the tympanum," and in studying the problem now presented, "The question then arose in my mind," he says, "whether an armature might not be set in motion by a membrane similar in shape and structure to that in the human ear, so as to produce a current which should correspond to the vibrations of the air."

He states, however, very frankly, "*I did not at this time devise any method* of combining a membrane with an armature."

The problem was evidently of too difficult a nature to be solved immediately upon its statement. Although his attention had been turned generally to the consideration of a membrane and a metallic armature as instrumentalities which might possibly be so combined as to effect the result sought, it appears that he was unable as yet to devise any method of so combining them as to even theoretically accomplish the purpose.

Upon Mr. Bell's return to Boston he still gave his attention to the problem and sought out Dr. Blake, as he says, "for the purpose of showing the experiments I had made, and of obtaining further information with regard to the structure and mechanism of the human ear to aid me in my efforts to devise a method of producing vocal sounds electrically." *

---

*Mr. Cross has testified as follows (C. Vol. 2, page 1727):

"Q. 34. From the first part of 1874, when you became acquainted with Mr. Bell, up to the beginning of June, 1874, did you see him much or little? Ans. I saw him very frequently.

"Q. 35. During the following winter, from the fall of 1874 to the spring of 1875, did you meet him? and if so, how much? Ans. I continued to see him frequently, though not so often as the preceding spring.

"Q. 36. Did he or not, during that winter, speak to you about the electrical transmission of speech? and, if so, did he state to you any conception he had as to how it could be accomplished, and did or did not his mind appear to you to be much occupied on that subject? Ans. We conversed together at that time regarding the transmission of speech. I understood that he proposed to do this by means of electrical undulations, and that these undulations were to be produced by the vibration of a reed in front of a magnet. At some time during this winter he communicated to me the idea of vibrating the reed by means of a membrane.

"The subject of the transmission of speech was one which evidently occupied his thoughts, and to accomplish which he was striving to develop an efficient method.

"Q. 37. Did you form any opinion at that time as to the theoretical adequacy and perfection of the undulatory current method which he then disclosed to you? Ans. As soon as the method itself was described, I saw that it was theoretically perfect; and therefore, in theory, adequate to the transmission of speech.

"Q. 38. Did you form any opinion at the time, and if so, what, as to the practicability of accomplishing it according to that method of employing an armature and membrane vibrated by the voice to generate the undulatory current relied upon? Ans. I supposed, at that time, that the effect produced by the vibration of an armature would be entirely too small to accomplish the desired end.

"Q. 39. Did he or did he not, during that winter, speak to you of the employment, for purposes of multiple telegraphy, of currents produced by the sonorous vibrations of a reed armature in front of an electro-magnet? Ans. He did.

"Q. 40 Did you form any opinion at that time as to the practicability of em-

A more detailed account of the nature of the information sought by Mr. Bell at this time is given in his deposition (C. Vol. I, page 123):

"Int. 50. Did you have any conversation on that occasion with Dr. Blake as to whether the human voice could vibrate the membrane with attached armature, and if so, state what, and whether any drawings were made by either of you to illustrate that topic. A. I have a recollection of asking Dr. Blake's opinion on this point, and the impression that I got from his remarks was that it could if the membrane were made concave, like that in the human ear, and if the end of the armature were attached, not to the center of the membrane, but to a point a little to one side, corresponding to the point of attachment of the malleus and tympanic membrane of the ear.

"I do not recollect whether any drawing was made of this idea at that time, but I remember our discussing the operation of the harp arrangement, marked "Fig. 4," in Exhibit 30, and comparing the apparatus to the organ of Corti in the human ear. I remember also that Dr. Blake suggested that a damping arrangement would have to be attached to the harp arrangement, and that he made a drawing of the manner in which the rods of Corti were damped in the ear."

Dr. Blake, however, in his version of the matter, goes much further in his statement in some respects, than does Mr. Bell.

He says (C. Vol. I, page 337, *et seq.*) that not only was the subject discussed generally, but a mode of combining a membrane and an armature was mentioned, to wit, taking an improved phonautograph, with the stylus hinged at the periphery of the membrane and moved by a piece of wood

---

ploying currents so produced for the purpose of harmonic multiple telegraphy, and if so, what is it? Ans. This plan seemed to me to involve far less difficulty than the transmission of speech. I did not consider very fully what difficulties might be found with it in practice.

"Q. 41. Did you know, during that winter and spring, or did you hear, during that winter and spring, of anything in his condition and surroundings which was calculated to prevent him from devoting his time and attention to experimental work concerning the electrical transmission of speech; and if so, what was it? Ans. I understood that his means were very limited, so that he was obliged to confine himself very closely to his classes, which necessarily occupied a great part of his time. I also understood that he was under obligation to certain persons to devote his attention and experimentation exclusively to multiple telegraphy."

connecting it with the center of the membrane and simply substituting a metal reed for the hinged stylus, or, in a word, using a metal stylus with its pen point cut off.

He also makes the somewhat remarkable statement that neither he nor Mr. Bell had any doubt but that the strength of the induced electrical impulses would be sufficient for the purpose, and that no difficulties were anticipated "except so far as purely mechanical difficulties were concerned in the use of animal membranes," and that thereafter his "interest in the experiments of Mr. Bell became less,'' because he had apparently attained the solution of the problem of the electrical transmission of speech.

"Int. 4. Did he describe to you any electrical apparatus in which a membrane was to be used? If so, please tell me what that apparatus was. A. Yes; an apparatus in which one metal reed was substituted for the several metal reeds, of the harp last mentioned, this one reed being actuated by a membrane to which it was to be attached, which membrane was to be set in vibration by the tone of the musical instrument or by the human voice.

"Int. 5. Did you have any discussion with him as to the character of the membrane, or mode of arrangement of the membrane and armature, and if so, state what was said on that subject at that interview by both of you. A. Yes, the idea of Prof. Bell, as communicated to me, was this: That if the simple pendulous vibration of a metal reed could be communicated to a second reed, electrically connected with the first, more complicated vibrations communicated to the metal reed from a musical instrument or the human voice, through the medium of the air, could also be electrically transmitted. To accomplish this purpose, it was, according to his idea, advisable to attach the metal reed to a membrane, which would reproduce the aerial vibrations produced by a musical instrument or the human voice, substituting a metal reed in fact for the stylus of the improved Morey phonautograph, and of the *membrana tympani* phonautograph with which he had been experimenting. I then suggested, as an experiment, since his principal object was the electrical transmission of articulate speech, that the metal reed should be brought in contact with the human *membrana tympani*, suitably prepared and mounted for the purpose.

"Cross-Int. 47. If I understand you, Mr. Bell had not tried the experiment at that time, but only proposed it as a possible solution of the question. Am I correct? Ans. So I understood him.

"Cross-Int. 49. Did he anticipate any difficulty in accomplishing the object by that proposed means, or express any fear that it might not practically answer the purpose? Ans. None, except so far as purely mechanical difficulties were concerned in the use of animal membranes.

"Cross-Int. 50. Did you express the opinion that the strength of the electric currents generated in that way would be sufficient to reproduce in the receiving reed the same vibrations as were imparted to the transmitting reed? Ans. Yes. I am not aware that the doubt occurred to either of us.

"Cross-Int. 60. Did you have any talk with him about telephones between the time of that interview and the beginning of 1877? Ans. I did.

"Cross-Int. 61. When, and how often? Ans. I can not recall dates—at long intervals, I think, because after the date of this interview in October my interest in the experiments of Mr. Bell became less, as he had apparently attained the solution of the problem concerning which he consulted me, namely, the transmission of articulate speech electrically.

"Cross-Int. 62. When did your interest begin to decrease in consequence of your belief that he had attained the result he was aiming at? Ans. At or soon after the date of this interview in October."

"Cross-Int. 79. At that interview who first suggested the employment of a membrane, you or Prof. Bell? Ans. Prof. Bell told me that, as the results of his experiments with a membrane phonautograph, he had conceived the idea of a way in which speech could be electrically transmitted. I replied, 'I think that I know how you would accomplish it, by making a membrane actuate a mental stylus.' Mr. Bell replied, 'That is precisely my idea. If a membrane like the human *membrana tympani* moves a weight such as that of the ossicles, a membrane having a metal reed attached to it should move that reed in response to the human voice.' His further idea, as communicated to me, was, that by means of this arrangement undulations should be produced in an electric current corresponding to the undulations of the air produced by the human voice.

"Did he ask your opinion as to whether the human voice could or could not vibrate a membrane with a stylus or armature attached? Ans. Yes."

"Cross-Int. 86. What answer did you give to his question? Ans. That it could, if proportioned properly to the membrane, but that I doubted if a plane membrane would reproduce with sufficient accuracy the sound waves resulting from the human voice.

"Cross-Int. 87. And then you went on to suggest bringing the metal reed in contact with the human *membrana tympani,* suitably prepared and mounted for the purpose, did you not? Ans. Yes."

"Cross-Int. 98. Had he experimented with the phonautograph at the Institute of Technology? Ans. So I understood.

"Cross-Int. 99. What was the construction of that instrument? Ans. That of the ordinary membrane phonautograph, with the stylus hinged at the periphery of the membrane and moved by a piece of wood connecting it with the center of the membrane.

"Cross-Int. 100. What was the diameter? Ans. I can not remember exactly; I should think about six inches."

"Cross-Int. 101. About how long was the stylus? Ans. I can not remember exactly; I should think between twelve and eighteen inches, including the pen at its extremity.

(Mr. Bell has described the construction of the phonautographs used by him as follows. C. Vol. I, page 114:)

"Int. 23. When, if ever, did you become familiar with the Scott phonautograph referred to in Prof. Cross' twenty-eighth answer, page 395? Ans. In the winter of 1873–74.

"Int. 24. Did you during that winter construct any phonautographs yourself? A. I did; early in 1874.

"Int. 25. In those that you constructed how was the rod which carried the style attached to the phonautograph frame, and how was it moved by the membrane? Ans. One end of the rod was hinged by means of a piece of leather or calico to the edge of the circular frame carrying the membrame. A small piece of cork was fastened to the center of the membrane and to the rod. Upon uttering a sound in the neighborhood of the membrane, it was caused to vibrate, and force the rod to vibrate also. The free end of the rod projected considerably beyond the opposite edge of the membrane, and its vibrations were recorded on smoked glass."

It does not appear that Dr. Blake was, after all, of much or any service to Mr. Bell in aiding him toward the coveted solution of the difficult problem which he knew *must* yet be solved before there could be any successful transmission of speech by electricity.

In fact, the more the problem is studied the more serious is seen to be its nature. Even the sanguine doctor, in considering the phonautographic animal membrane with its proposed attachment to a hinged metal stylus, is compelled to doubt (and very justly) whether, under such circumstances, "a *plane* membrane would reproduce with sufficient accuracy the sound waves resulting from the human voice."

The deep perplexities of the case arose from the fact that there were two difficulties encountered, both of them severely practical, but each in antagonism to the other, so that the very conditions which would remove one would intensify the other, and yet they must both together be surmounted in a single structure.

On the one hand, the armature must be so arranged that in some way it shall present a reasonable surface to receive the impact of the air particles, and at the same time be so thin, so easily vibrated and so delicately poised that, notwithstanding its inertia, and in spite of the force with which it would vibrate after a law of its own, it would yet respond freely, instantly and sympathetically to every sonorous air vibration. Moreover, what is of even more vital importance to the transmission of articulate speech, because it lies at the basis of the *quality* of sounds, it must accurately respond to that ever varying and often abruptly changing velocity of the air particles in the different parts of their vibration.

On the other hand, and in direct opposition to these conditions, the armature must also contain sufficient metal, preferably iron or steel, and be of such size and weight that its approach and recession before an electro-magnet, within the exceedingly narrow ranges of its movement, should yet be so potent as to induce upon the circuit electrical impulses of sufficient strength to set the receiving armature into corresponding audible vibrations.

These were the actual conditions of the problem as they presented themselves to Mr. Bell in 1874. He had arrived at a clear apprehension of a *principle* which fulfilled all the theoretical requirements of the case, and which might, possibly, be capable of a practical application which would be of great value to the world.

But the *invention*, the actual embodiment of that principle in a working apparatus, had yet to be accomplished.

The conditions, moreover, were so perplexing, and the difficulties so apparently insurmountable, that they actually produced even in Mr. Bell's mind a state of positive *incredulity* as to the practicability of any solution of the problem upon these lines.

Complainants' expert, Mr. Pope, has set forth very clearly one phase of the difficulty, as it must have appeared to Mr. Bell, as follows (C. Vol. 2, page 1293):

"Very little was known, at that date, as to the actual mechanical effects which were capable of being produced by the sonorous atmospheric vibrations accompanying the production of ordinary sounds, such for example, as those produced by the human voice. Perhaps the only application of this force to produce an appreciable result, which was at all well known at that date, was the phonautograph, so called, in which the vibrations of a membrane produced by sound waves were made to move a bristle over a surface of smoked glass through a very small range of vibration. The power required to effect this was inconceivable in amount.

"On the other hand, all the different kinds of apparatus then known for the transmission of signals by magneto-electricity, such, for example, as the dial telegraphs of Wheatstone, of Siemens, and of Highton; the needle telegraph of Highton, and the magneto Morse Key of Siemens and Halske, required the exercise of a considerable degree of mechanical force upon the armature of the transmitter, in order to communicate a slight movement to the delicate armature or needle of the receiver; the mechanical effect produced at the receiver in each of these instruments being probably not more than one per cent. of that exerted upon the transmitter.

"In view of the state of knowledge at the date of the patent, it could hardly have been supposed that a magneto-generator, moved by a force no greater than that which served to move the bristles of the phonautograph, would under any circumstances be able to generate an electric current which would produce upon a receiving instrument any effect whatever, which would be perceptible to the senses."

We can now appreciate, in a measure, the complex nature of the problem, and the practical difficulties involved in its solution.

We can also understand what would otherwise have been inscrutable, how it happened that Mr. Bell himself, up to June 2, 1875, regarded his plan as so "impracticable," and was so utterly incredulous of its success, that he could not bring himself to perform a single experiment, or to make the slightest test tending to determine the correctness of his theory, or the possibility of its practical application. This was the case, although he had the means at hand, membranes, armatures, electro-magnets and line wire, together with the expert assistance of Mr. Watson for a number of months, and although a test experiment could have been made by simply arranging together two of the magneto receivers, already employed for multiple telegraph purposes, and with little or no trouble, and at no cost whatever, either in time or money. (C. Vol. 2, page 1607.)

And yet, notwithstanding this practical manifestation of his actual incredulity, it appears that, upon the occasion of his visit to Washington in the succeeding February and March, Mr. Bell called upon Prof. Henry and explained to him all his inventions, and especially his plan for the electrical transmission of speech by the proposed "harp apparatus," and sought his advice, evidently in the hope that some additional light might be gained as to the necessary conditions under which a practical construction might be effected.

Although Prof. Henry's ready sympathy and encouragement were highly esteemed by Mr. Bell, his opinions as expressed, instead of clearing away the obstacles, appear rather to have intensified Mr. Bells' just appreciation of some of the difficulties which must be overcome to effect the embodiment of the principle in any practical working construction.

"While in Washington attending to this business, I called upon Prof. Henry and explained all my inventions to him. His appreciation encouraged me very much, and he pronounced my plan for the electrical production of articulate speech, the germ of a great invention.

"I recollect explaining to him the idea of an instrument with a number of armatures tuned to different pitches, which I have before described, and it was with reference to this apparatus that he made the above remark.

"We had some conversation about the mechanical power of stretched membranes. I can not recollect the details of it, but I remember that the effect of his remarks was rather discouraging as to my being able to obtain the results from a stretched membrane which I had hoped. I remember that the impression left upon my mind was, that each stretched membrane would have a rate of vibration peculiar to itself."

In a letter written at the time to his parents, Mr. Bell refers to this portion of the interview as follows (C. Vol. 1, page 126):

"I felt so much encouraged by his interest that I determined to ask his advice about the apparatus I have designed for the transmission of the human voice by telegraph. I explained the idea and said, 'What would you advise me to do, publish it and let others work it out, or attempt to solve the problem myself?' He said he thought it was the germ of a great invention, and advised me to work at it myself instead of publishing. I said that I recognized the fact that there were mechanical difficulties in the way that rendered the plan impracticable at the present time. I added that I felt that I had not the electrical knowledge necessary to overcome the difficulties. His laconic answer was, 'GET IT.'"

The entire letter is interesting and is as follows:

292 Essex St., Salem, March 18, 1875.

Dear Papa and Mamma:

I have just returned from my trip to New York thoroughly worn out. Found your letters of the 14th inst. awaiting me. I am now beginning to realize the cares and anxieties of being an inventor. In order to complete the apparatus (multiple telegraph, see Int. 60), as thoroughly as possible, I have decided to give up all professional work for some weeks. I have put off all pupils and classes until the 12th of April. Flesh and blood could not stand much longer such a strain as I have had upon me. Professional work is all in confusion, and the only way is to cut the Gordian knot, and throw up everything until the end is achieved. I long to write full accounts to you and I have delayed writing in order to give a connected narration of the whole. You seem to think that my anxieties are over, when in truth they are really only beginning.

Before entering upon explanations, let me ask you first to hunt over all my old letters that you have preserved, for everything bearing on the telegraph. Forward to me at once as evidence. I must take action at once in regard to foreign patents. Will you or uncle help me in this?

What I would like is this: I have written to my lawyers in Washington to make application for foreign patents on my own responsibility.

Should I prove unable to pay for these applications at once, will you help me? While these applications are being got out I shall write to the Herdmans, offering them a share if they will take the pecuniary burden of any interference, etc., that may arise abroad from Mr. Gray. Should they decline—which I should think unlikely—I should of course relinquish a foreign contest.

Whenever I am free to dispose of my interest in the invention I shall do so, and then you may expect to see visible speech go ahead. I can then take up the electro-motor which I think as valuable an idea as this telegraph.

Now to resume telegraphy. When I was in Washington I had a letter of introduction to Prof. Henry who is the Tyndall of America. I had found on inquiry at the Institute of Technology, that some of the points I had discovered in relation to the application of acoustics to telegraphy had been previously discovered by him. I thought I would therefore explain all the experiments and ascertain what was new and what was old. He listened with an unmoved countenance but with evident interest to all; but when I related an experiment that at first sight seems unimportant, I was startled at the sudden interest manifested.

I told him that on passing an intermittent current of electricity through an empty helix of insulated copper wire, a noise could be heard proceeding from the coil similar to that heard from the telephone. He started up, said, "Is that so? Will you allow me, Mr. Bell, to repeat your experiments and publish them to the world through the Smithsonian Institute, of course giving you the credit of the discoveries?"

I said it would give me extreme pleasure and added that I had apparatus in Washington and could show him the experiments myself at any time. He asked if I could do it then if he went with me, and I told him I had everything in readiness at Mr. Hubbard's house. He said, "I will go with you now. Have you a carriage here?" I had not, and so he put on his coat and was about to order his carriage, when I offered to save him the trouble of going out on such a raw damp day by bringing the apparatus to the Smithsonian Institute. (He was suffering from a cold and besides is very aged—I believe about eighty years old.)

We appointed noon, next day, for the experiment. I set the instrument working and he sat at a table for a long time with the empty coil of wire against his ear, listening to the sound. I felt so much encouraged by his interest that I determined to ask his advice about the apparatus I have designed for the transmission of the human voice by telegraph. I explained the idea and said, "What would you advise me to do; publish it and let others work it out, or attempt to solve the problem myself?" He said he thought it was the germ of a great invention, and advised me to work at it myself instead of publishing. I said that I recognized the fact that there were mechanical difficulties in the way that rendered the plan impracticable at the present time. I added that I felt I had not the electrical knowledge necessary to overcome the difficulties. His laconic answer was, "GET IT."

I can not tell you how much these two words have encouraged me. I live too much in an atmosphere of discouragement for scientific purposes. Good ——— is unfortunately one of the *cui bono* people, and is too much in the habit of looking at the dark side of things. Such a chimerical idea as telegraphing *vocal sounds* would indeed, to *most minds*, seem scarcely feasible enough to spend time in working over. I believe, however, that it is feasible and that I have got the cue to the solution of the problem.

Prof. Henry seemed to be much interested in what I told him, and cross-questioned me about my past life and specially wanted to know where I had studied physics.

Having left Prof. Henry and Washington, I proceeded to New York, where I saw Mr. Orton and Mr. Prescott, the electrician. Arrangements are made for me to bring my instruments to New York and experiment on real line wire.

I left Boston last Sunday and called at the office of the Western Union on Monday. Mr. Orton and Mr. Prescott both devoted a large portion of their time in discussing with me, the whole plan, from its theoretical point of view. Mr. Smith, the manager of the experimental room, was absent from town, but was telegraphed for. He replied that he could not come till next morning. Tuesday forenoon we had batteries connected and I tuned up my instruments. They went like clock work. I have come to the conclusion that, by a happy chance, they are much more perfect than I thought at first. The signals are as clear, sharp and rapid as with the ordinary Morse sounder. I connected two transmitters and two receivers on only one line, and two messages were sent simultaneously.

We had 100 cells of a battery and all went well on our artificial circuit. Mr. Prescott then said he would like to see them tried on a real line wire. He telegraphed to Philadelphia to have two wires crossed there so as to give us (practically) a continuous wire from New York to Philadelphia and back. The electro-magnets I employed were not intended for trial on a long line. They were wound with coarse wire and the "resistance" was only "3 ohms." Ordinary electro-magnets for actual service on a line have a resistance of about 200 to 600 ohms. None of us, therefore, expected the instruments to work without stronger magnets. But they *did work*. The signals, though feeble, came sharply and concisely through the 200 miles of line wire. I suggested trying stronger magnets, so Mr. Prescott ordered the instruments to be taken to the work shop, and stronger magnets placed on them. They were to be ready in the afternoon, so I went out to dinner and returned in a couple of hours.

Rest will form subject for next letter.

With fond love, your ever affectionate son,

ALECK.

Prof. A. M. BELL, Brantford, Ontario.

IX.

In the autumn of 1874, after his return from Canada, Mr. Bell entered into an arrangement with Mr. Gardiner, G. Hubbard and Mr. Sanders, whereby they became interested in his inventions and furnished the funds for the prosecution of experiments and obtaining the necessary patents.

Immediately thereafter, in connection with his professional pursuits, Mr. Bell devoted himself principally to the practical development of his system of multiple telegraphy, both in accordance with his original plans and in connection with the use of induction coils.

The particulars of this work appear in the record as follows:

"Cross-Q. 342. (C. Vol. 2, page 1600.) From the summer of 1874, till at least as late as June 2, 1875, your experimental work was confined almost, if not quite, exclusively to your multiple telegraph inventions, was it not? Ans. Yes, excepting so far as my professional experiments in teaching correct articulation to deaf mutes and persons with defective speech was concerned. During the early part of the period referred to my professional experiments occupied most of my time.

"Cross-Q. 343. Within the period I have mentioned in my last question how many patents did you take out or apply for in this country on inventions relating to multiple telegraphs; and will you state the particular subjects of said inventions, the dates when the applications were filed, and the dates when the patents were granted? Ans. 1. Application, February 25, 1875. Multiple telegraphy, circuit-breaking vibrators for transmitters and tuned reed receivers; patent not issued; in interference with Gray. 2. Application, March 6, 1875. Vibratory circuit-breaker and autograph telegraph. Patented as No. 161,709, April 6, 1875. 3. Application, March 10, 1875. Multiple telegraph circuit-breaking transmitters used with induction coils; in interference with Gray; patent not issued."

"Cross-Int. 225. (C. Vol I, page 188.) Did you practically try the arrangement which you so conceived in December, 1873, for inducing the intermittent current on the line wire? Ans. I did not at that time.

"Cross-Int. 226. At what time did you? Ans. I made numerous experiments with induction coils in the winter of 1874–75, but I can not be certain that the full arrangement of circuit shown in Fig. 4 was tried, but I believe it was. I at all events remember experimenting with a single induction coil, having an interrupter and receivers arranged as in Fig 4, and I remember changing the interrupter, substituting for it an interrupter of different rate of vibration. The point I am uncertain about, is as to whether a number of induction coils were used, as in Fig. 4. The arrangement shown in Fig. 5 was not tried. I can not fix the dates of these experiments otherwise than the winter of 1874–75. They might have been as early as the 1st of November, 1874."

"Cross-Int. 229. After the experiments were tried in the winter of 1874–75, which you have mentioned, what did you ever do with a view to the practical trial of the arrangement you had conceived for inducing the intermittent current on the line wire, or for any use of the induction coil between the interrupter and the receiver? Ans. I satisfied myself by practical experiment, that an induction coil could be practically used, but my difficulty was to get interrupters so tuned as not to interfere with one another's action. A great portion of my time from February, 1875, to June, 1875, was taken up in experiments to overcome this difficulty.

"Cross-Int. 230. With what result? Ans. The experiments led me to the discovery, made on the 2d of June, 1875, which has been described at length in my deposition."

The details of Mr. Bell's work upon his multiple telegraph system, during this period, are given with more particularity in his Preliminary Statement in Harmonic Interferences, as follows (C. Vol. IV Exhibits, page 987):

"At Mr. Hubbard's suggestion I decided not to file my caveat, but to have apparatus constructed as speedily as possible, so as to make application for a patent instead. Two transmitting instruments and receivers, like these shown in Fig. 18, were at once made, and were arranged upon circuit as in Fig. 19. The very first time they were tried they worked satisfactorily. When K^1 was depressed, R^1 alone was affected; when K^2 was depressed, R^2 alone

was affected. When K^1 and K^2 were depressed simultaneously, R^1 and R^2 both responded. The attempt to use the induced current with these instruments was unsuccessful. Not knowing fully the cause of the failure, it was decided to prepare the instruments that were successful for the purpose of securing the patent, and to leave the utilization of the induced current to be investigated at a later date.

"It is needless to detail the whole of my experiments. I shall seek only to point out the various stages of development.

"The pitch of each transmitting instrument changed the moment its key was depressed. The pitch varied with the length of the circuit. It was rendered independent of the resistance of the line by connections shown in Figs. 20, 21 and 22. The pitch was also affected by the strength of the battery.

"The spark in the transmitting instrument at the point where the circuit was broken, was lessened by the use of a condenser.

"The armature of the receiving instrument answered loudly to any pitch when it was placed in close contact with the face of its electro-magnet, but responded only to its proper pitch when it was placed about a quarter of an inch distant.

"A rubber band (d) attached to the armature, served as a damper (Figs. 20, 21 and 22) so as to stop the vibration of the receiver immediately on the cessation of the electrical impulses.

"One form of receiving instrument constructed at this time is shown at R, Fig. 23. A wrought-iron nail (n) was placed between two cylindrical pieces of iron (i) inside a helix of wire. A note of similar pitch to that produced by the transmitting instrument proceeded from R. The instrument was not, however, sensitive to one pitch alone, but reproduced very loudly the unison of whatever transmitter was employed. These experiments were made in November, 1874.

"An attempt was also made by means of bar-magnets arranged around a cylinder as in Fig. 24 to induce a current that would work the receiving instruments. The results were unsatisfactory. During the winter of 1874–75 it was attempted to use organ reeds (from the vox humana stop) as transmitting instruments. The mode of connection is shown in Fig. 25. The tongue (t) was insulated from the bed of the reed B by means of paper. The tongue (t) vibrated against a platinum plate P, making and breaking the circuit. The reeds soon got out of order, and were very liable to change in pitch, so that the electro-magnetic transmitters were preferred.

"In January, 1875, the thought occurred of rendering the pitch of the transmitting instrument independent of the strength of the battery, as well as of the resistance of the line, by causing the vibrating armature to strike alternately against two fixed points. One made contact for a local battery, the currents of which traversed the electro-magnet, and served to keep the armature in vibration. The other communicated with the main battery and the line wire, but not with the electro-magnet. The arrangement (see Fig. 26) proved so successful that I felt that the instrument was near

completion. I constructed armatures of various materials, but finally decided to use those made of clock-spring.

"Platinum connections could not be soldered on without spoiling the temper of the spring. Finally a small rivet of platinum was inserted in the spring where it came into contact with the fixed points. A sliding clamp was fastened to the armature of the receiving instruments for tuning it. The rubber damper was omitted, as the spring was allowed to strike the face of the magnet.

"It was next perceived that the armature of the receiving instrument would operate an ordinary Morse sounder, or any electro-magnetic machine, if it struck a body of slower vibration than itself, when the vibratory motion of the armature would be converted into permanent make or break of a local circuit. The first form of vibratory circuit breaker is shown in Fig. 27. A light lever of straw S was hung vertically in front of the receiver R, when the armature vibrated the platinum plate P into contact with the wires W W^1, completing a local circuit in which was placed a Morse sounder. The instrument was still further improved as in Fig. 28, in which form a patent was granted to me in February, 1875, No. 161,739. The oxidization of the mercury in the cups C C, Fig. 28, was prevented by covering it with glycerine.

"The autograph telegraph described in the specification of the same letters-patent was invented at the same time. See Fig. 29.

"During the early part of February, friends in Salem tested the instruments by sending two messages simultaneously over the same wire, by an alphabet of numbers arranged for the occasion. The words 'multiple telegraph' were sent by one instrument, and 'autograph telegraph' by another. Then the words 'Katie Silsbee,' 'Valentine,' and 'well done,' and at the same time the words 'multiple,' 'cat,' 'Lizzie' and 'lovely,' only one wire being used in both experiments.

"On another occasion four stations, A, B, C, D, were arranged on the same circuit; and among other messages the words, 'bravo, bravo, bravo,' were sent from A to D, while 'good tidings' were sent from B to C. These experiments were entirely successful.

"During this month, February, 1875, I visited Washington and retained Messrs. Pollock & Bailey as solicitors for my patents; and left my models of the transmitting instrument, receiving instrument and vibratory circuit-breaker with them. I met there Mr. Orton, the president of the Western Union Telegraph Company, who was much interested in my instruments and requested me to call upon him as I passed through New York on my way home, which I did.

"In conclusion I would say, that the invention, the subject-matter of the first interference between my application, dated February 25, 1875, and the application of P. La Cour, filed March 3, 1875, and of Elisha Gray, filed February 23, 1875, namely:

"'The method of transmitting two or more telegraphic signals or messages simultaneously along a single wire, and of receiving the same without confusion by the employment in an electric circuit of two or more transmitters, each transmitting per second impulses differing in number from the others in combination with receivers, each tuned to a pitch at which it will be put in vibration to produce its fundamental tone by one only of the transmitters,'—described by me in the first clause of my claim, and by Elisha Gray in his first, third, fifth and seventh claims, was invented by me prior to August, 1870, and reduced to practice on or about the first day of November, 1872. (See the above statement, p. 2.)

"The inventions, the subject-matter of the second interference between my application and that of Elisha Gray, namely:

"1st. The combination of a main line, an intermittent circuit-breaker adapted to throw upon the line a definite number of electrical impulses in a given time, and a key for controlling the throwing of such impulses upon the line, described in my second claim and Elisha Gray's second claim.

"2d. The combination in one electric circuit of a series of such intermittent circuit-breakers, and a series of such keys, there being a key for each intermittent circuit-breaker —were invented by me prior to August, 1870, and reduced to practice on or about the first day of November, 1872. (See the above statement, pp. 2 and 5.)

"The invention, the subject-matter of the interference between my patent, No. 161,739, and the application of Elisha Gray, filed February 23, 1875, and that of P. La Cour, filed March 3, 1875, namely, 'the combination with the portion of the receiver put into vibration by the musical impulses of a circuit-controlling lever or bar, arranged and adapted to vibrate more slowly than the former' described in my second and Elisha Gray's four claims, was invented by me in January, 1875, and reduced to practice on or about the 8th day of February, 1875. (See above statement, p. 16.)"

A. GRAHAM BELL,
Boston University, April 27, 1876.

It would appear from the foregoing statements that multiple telegraph instruments constructed and arranged upon the original plan had finally been perfected, and had passed successfully the ordeal of a practical test. But there still remained inherent in this plan the defect already pointed out by Mr. Bell (C. Vol. IV Exhibits, page 981), to wit, that under the existing conditions messages could be sent in only one direction, as free earth communication was possible at one end only of the line. If the currents, however, could be *induced* in any way upon the main circuit, free earth communication could be had at both ends of the line, and this defect would be obviated.

The application of any system of induction, however, involved serious practical difficulties, and the subject, therefore, seems to have received a degree of attention, so far as circumstances would permit, commensurate with its vital importance.

"The attempt to use the induced current with these instruments (made in the autumn of 1874) was unsuccessful. Not knowing fully the cause of the failure, it was decided to prepare the instruments that were successful for the purpose of securing the patent, and to leave the utilization of the induced current to be investigated at a later date."

The patent referred to was applied for "February 25, 1875," two days after the filing of Mr. Gray's application for the same invention, which was filed "February 23, 1875," thus affording a coincidence well calculated to intensify their rivalry.

Mr. Bell states the effect upon himself as follows: (C. Vol. 2, page 1602.)

"When these applications (Mr. Bell's) were filed in the patent office, I was soon thrown into interference with Mr. Elisha Gray, who had developed a somewhat similar system of multiple telegraphy. This circumstance threw me into a fever of excitement. I feared that I might lose the fruits of laborious researches carried on for years under great difficulties, and I therefore devoted every moment I could spare to the development of multiple telegraphy. Indeed, I devoted to this subject more time than I could spare, for it led to the subordination and partial neglect of my professional work, so that I was soon in such a position that I was not earning my support."

It appears, however, that the application of induction coils had been so far perfected by Mr. Bell that on March 10, 1875, he made application for a patent for "Multiple telegraph circuit-breaking transmitters used with induction coils;" that "after the experiments were tried in the winter of 1874 and 1875," or during that period, he satisfied himself by practical experiment that an induction coil could be practically used, but his difficulty was to get interrupters so tuned as not to interfere with one another's action; that a great portion of his time from February, 1875, to June, 1875, was taken up in experiments to overcome this difficulty, and that these experiments led him to the discovery of June 2d.

The record contains no recital or account of any practical test having been made with instruments provided with induction coils, as for example, by sending two messages simultaneously over the same wire, even in one direction, as had been done with his former instruments. It is perhaps a fair inference, however, from Mr. Bell's statements that he had at this time so far perfected the apparatus that, as far as the induction coils were concerned, it was capable of practical performance, so that by its use two messages could be transmitted simultaneously in both directions.

But however that may be, the incident which happened June 2, 1875, led him to believe that he had found an *alternative* method of inducing currents which possessed certain important advantages for the purposes of multiple telegraphy, as was subsequently set forth in his patent of March 7, 1876.

This is made clear by the context to the passage already quoted from his deposition as follows: (C. Vol. I, p. 189.)

"Cross-Int. 233. Did you at any time after that make any practical trials in reference to the use of an induction coil for inducing currents upon the line wire? Ans. I did, many.

"Cross-Int. 234. For what purpose and with what result? Ans. For the purposes of multiple telegraphy. I found that the currents induced in the secondary circuit of an induction coil by the action of an interrupter in the primary circuit occasioned a much more powerful vibration of the tuned reeds of my harmonic receivers than the magneto-electric currents I was then able to produce.

"Cross-Int. 235. Did you, in consequence of this observation, apply to practical use the induction coil with a secondary circuit? Ans. I did not. I kept it in view in experiments relating to multiple telegraphy, but I believed that the magneto-electric currents possessed many advantages for this purpose if the strength of the magneto currents could be increased, and that they could be used in addition for the transmission of articulate speech electrically; and I therefore devoted most of my time to ascertaining the conditions under which the most powerful magneto currents were produced."

X.

But all this time the subject of the possible solution of the problem of the electrical transmission of speech still remained under consideration. Mr. Bell says (C. Vol. 2, page 1603):

"During this period it must not be supposed that I had forgotten or neglected my ideas concerning the speaking telephone. Although, as stated above, I felt it my duty to devote all my spare time and thoughts to the development of multiple telegraphy, I could not help thinking and dreaming of the speaking telephone. It was constantly in my mind."

The subject had for him a peculiar fascination, and, although during this time it was kept in the background by the strenuous efforts he felt compelled to put forth to complete the multiple telegraph, it was by no means dismissed from his thought. The hope of a possible ultimate success, to be attained in some way and by some means, was evidently still cherished, and this very hope acted as a stimulus to his powers.

While the obstacles in the way of the practical development of the plan he had devised were so apparently insurmountable that, as we have seen, he did not attempt even so much as a single experiment to test any of the conditions involved, he was still thinking and dreaming over the subject and it was constantly in mind.

At length, some time in the spring of 1875, a new idea occurred to Mr. Bell, which he thought might possibly lead to the development of another plan for the electrical transmission of speech.

The circumstances are related in a letter written at the time by Mr. Bell to Mr. Hubbard, as follows (See Vol. I, page 129):

"SALEM, MASS., May 4, 1875.

"*Dear Mr. Hubbard:* * * * Letter received from Mr. Pope, with directions for preparing paper. Letter received from Prof. Henry of the Smithsonian Institute, in answer to one I wrote him some time ago, telling him of recent experiments undertaken in order to determine the cause of the sound heard from the empty helix of wire.

"The deduction I had made from the experiments was that an intermittent current of electricity creates a molecular vibration in the conductor through which it is passed. Prof. Henry writes that he believes that my experiments are new, and that my explanation of the cause of the sound is, in his opinion, correct.

"An experiment which I have long desired to make, is at last within my reach. My friend Don Manuel Fenollosa, whose music rooms are next door to this house, is to allow me to experiment with his pianos. I shall carry a wire from my study into his room to-morrow, and try the effect of passing an intermittent current through the strings of a piano. Unless I am greatly mistaken, the string, whose rate of movement coincides with the molecular vibration induced in the wires by one of my transmitters, will resound loudly.

"Another experiment has occurred to me which, if successful, will pave the way for still greater results than any yet obtained. The strings of a musical instrument in vibrating undergo great changes of *molecular tension*. In fact, the vibration represents the struggle between the tension of the string and the moving force impressed upon it. I have read somewhere that the resistance offered by a wire to the passage of an electrical current is affected by the *tension of the wire*. If this be so, a *continuous current of electricity* passed through a vibrating wire should meet with a varying resistance, and hence a pulsatory action should be induced in the current. If this turns out to be the case, the oscillations of the current should correspond in *amplitude*, as well as in the rate of movement to the vibrations of the string. One consequence would be that the *timbre* of a sound could be transmitted.

"The plan for transmitting *timbre*, that I explained to you before, viz., causing permanent magnets to *vibrate* in front of electro-magnets, is chiefly defective on account of the feebleness of the induced currents. If the other plan is successful, the strength of the current can be increased *ad libitum*, without destroying *the relative intensities of the vibrations*.

"Yours respectfully,
"A. GRAHAM BELL.

"GARDINER G. HUBBARD, Esq.,
"Cambridge, Mass."

It will be remembered that in the letter written by Mr. Bell to his parents March 18, 1875, regarding his interview with Prof. Henry, and already quoted at length, the following passage occurs:

> "I told him that on passing an intermittent current of electricity through an empty helix of insulated copper wire, a noise could be heard proceeding from the coil, similar to that heard from the telephone." (The Reis telephone; see Cross-Q. 526, C. Vol. II, page 1665.)

It appears, from this letter of May 4, 1875, that Mr. Bell afterward made some experiments, in order to determine, if possible, the cause of this sound, and that these experiments led him to the deduction that it was due to a molecular vibration set up in the coil by the passage through it of the intermittent current.

This was an able deduction and met the entire approval of Prof. Henry.

The observation of the fact that the passage of an intermittent current through a coil of wire produced from it a sound corresponding in pitch to that of the vibrating circuit breaker in the transmitter (see Bell's American Academy Paper, C. Vol. I, pages 69, 70) led Mr. Bell, then, to make the practical deduction that if the intermittent current thrown upon a circuit by the vibrating reed of a transmitter was passed through the metallic strings of a piano, that string whose pitch or normal rate of movement coincided with the rate of the molecular vibration induced in the wires by the transmitter, ought to resound loudly.

And, conversely, that if a particular string, in unison with the pitch of the reed in one of his electro-magnet receivers, was placed in circuit with it, with a continuous battery current (see Ans. 68, page 134), that upon sounding the piano string the receiving reed ought to respond audibly.

It was a beautiful scheme, and with characteristic enthusiasm Mr Bell announces that *if* the experiment proves successful, "it will pave the way for still greater results," and proceeds immediately to outline his proposed new plan for the transmission of speech, all based upon the ever recurring but intractable "*if*."

"If" the resistance offered by a wire to the passage of an electrical current is affected by the tension of the wire, as he had somewhere read, a continuous current of electricity passed through a vibrating wire should meet with a varying resistance, and hence, a pulsatory action should be induced in the current. "If" this be so, the oscillations of the current should correspond in amplitude as well as in rate of movement to the vibrations of the string, and in consequence the *timbre* of a sound could be transmitted. The chief defect inherent in his original plan was the apparent feebleness of the induced currents. "If" the other plan be successful, no such difficulty will be encountered, for the strength of the currents can be increased *ad libitum*, without destroying the relative intensities of the vibrations.

Fortunately, the fundamental principle upon which the whole fabric of this reasoning was based could be brought to a simple but conclusive test. Mr. Bell knew that sympathetic vibration was most easily effected between two bodies tuned exactly in unison, and that therefore, if his premises were correct and his conclusions were rightly drawn, the loud vibration of either of such bodies, when they were in the arranged manner described, would cause the other to audibly respond, with a sound of the same rate of vibration, and at least with some amplitude or loudness.

He made the decisive test and the result is related as follows (C. Vol. I, page 134):

"Int. 68. Did you try at Mr. Fenollosa's rooms the experiment proposed in your letter to Mr. Hubbard of May 4th, and if so with what results? Ans. I tried the experiments within a day or two of the letter to Mr. Hubbard. I first passed an intermittent current from a current interrupter through that string of a piano which seemed to be in unison with the interrupter, and observed whether the string was thrown into sympathetic vibration. It was not. I then listened very closely to the piano, for the purpose of ascertaining whether any noise proceeded from the wire. I heard the pitch of the interrupter, but whether the sound was transmitted through the air from the adjoining house, or proceeded from the string in question, I was not able to satisfy myself. A continuous current was then passed through one of the wires of the piano, and through the coils of an electro-magnet in the adjoining house. Over the pole of that electro-magnet projected the free end of a steel reed, which was tuned to the pitch of the string.

"The string of the piano was then set in vibration by depressing the proper key of the piano, and the effect upon the reed noted. The reed was not thrown sympathetically into vibration. Upon placing my ear against the steel reed, I could hear very faintly the tone of the string, but I was unable to satisfy myself whether the sound I heard was electrically produced or had been transmitted mechanically to my ear. The piano was in an adjoining house, and the sound was faintly audible in the room where I tried the experiment."

Mr. Watson, who assisted him in these experiments, also testified, as follows (*Ibid.*, page 201):

"Int. 8. Do you remember the experiment at Mr. Fenollosa's music rooms in May, 1875? If so, describe it. Ans. I do. We had a line run between Mr. Bell's laboratory in Salem and the music room in the next building. We arranged a current interrupter on the line in the laboratory and passed the intermittent current through the strings of a piano at the music room. I remained at the laboratory during the entire experiment. Mr. Bell was at the music room during the first part of the experiment but came to the laboratory afterward. He told me that he could not be sure whether he heard a musical note on the piano string or not. We then arranged a harmonic receiver on the line at the laboratory, and he directed some one at the music room to sound continuously one of the strings of the piano, while he listened at the receiving instrument. My impression is that the result of the second experiment was the same as the first. I do not think I was able to hear anything in the second experiment."

Mr. Bell also repeated his account upon cross-examination, as follows (C. Vol. 2, page 1610):

"Cross-Q. 362. Will you describe that experiment exactly as you made it? Ans. My recollection of the experiment is very vague. After reading my letter to Mr. Hubbard of May 4th, I remember distinctly that I did make an experiment on one of the pianos belon ing to the late Don Manuel Fenellosa. My recollection of the experiment, as it lies in my mind now, is substantially this: That two wires were carried from my study window into the adjoining building, where Mr. Fenellosa's pianos were. In my study was placed one of my tuned interrupters and a battery, and the two wires were attached one to each end of one of the strings of a piano; I presume that string that corresponded in pitch with the interrupter employed. I can only state my general recollection of the details of the arrangement. My expectation was, that if we could pass the intermittent current through the proper string it would be thrown into audible vibration. I have a general impression that we found all the strings metallically connected together, but that I thought the experiment was worthy of a trial, as it might be possible that the string that corresponds in pitch to the reed of the interrupter employed might be thrown sympathetically into vibration.

"Another experiment which I intended to try and may, perhaps, have tried, although I can not recall the details now, was to have connected together in the same metallic circuit one of the strings of the piano and one of my tuned receivers (a battery to be included in the circuit). I hoped that if the reed of the receiver had normally the same rate of vibration as the string of the piano, the reed might be thrown into sensible vibration when the proper key of the piano was struck. Now that I come to think of the experiment, I have a dim recollection of watching a tuned receiver of some kind in my study, so that I am more inclined to think that this experiment was also tried. At all events, whatever, the exact details were, I remember distinctly that *some* experiments in pursuance of the letter to Mr. Hubbard of May 4th, were made with Mr. Fenellosa's pianos. In regard to the results I am not so clear. My general impression is, that we either obtained no results or indifferent results, but I can not assert this positively. My impression also further is, that whatever results were obtained we thought the construction of the piano not suitable for the experiments, and I think the dfficulty was that the strings were metallically connected together. I can not pretend to be precise, and have done my best to give you my recollection of the experiment just in the vague manner it lies in my mind at present.

It thus appears that the experiments ended in an acknowledged failure. The ordeal of a practical test proved fatal to the scheme and we hear nothing more of it. Even the circumstances and the results of the experiments eventually passed into the oblivion of " very vague " and " dim " recollections and mere impressions.

But Mr. Bell still continued the study of electricity and magnetism, and found much to encourage him in the observation of the extraordinary power of the electric current to produce audible sounds, when passed either through iron wires, the plumbago of an ordinary lead pencil, or even through a thin strip of brass simply held to the ear so as to form a circuit through the body, and he therefore, by no means abandoned the hope of yet securing the electrical transmission of the human voice.

This faith is shadowed forth in a letter written to his parents May 24, 1875, as follows (C. Vol. 1, page 132):

SALEM, MASS., May 24, 1875.

" DEAR PAPA AND MAMMA:

I am so immersed in telegraphy and science that I find it impossible to write freely about anything else, but I feel that at the present time you can scarcely be inclined to listen to anything I have to say on such subjects.

" Since I gave up professional work and devoted myself exclusively to telegraphy, I have been steadily gaining health and strength, and am now in a fit state to encounter Mr. Gray or any one else.

"The patents that have been granted to me without opposition are—

" 1st. The principle of converting a vibratory motion into a permanent make or break of a local circuit.

" 2d. The special form of ' vibratory circuit breaker' put in illustration.

" 3d. The autograph telegraph.

"The autograph arrangement is rapidly approaching completion. Already I can copy handwriting *quite legibly*, though not yet neatly. The rate of transmission by means of my instrument will be exactly ten times more rapid than 'Bakewell's Autograph Telegraph,' in which the rate is 300 letters per minute. When 3,000 letters per minute can be sent, my telegraph will be the most rapid as well as the cheapest.

" Every moment of my time is devoted to study of electricity and to experiments. The subject broadens. I think that the transmission of the human voice is much more nearly at hand than I had supposed. However, this is to be kept in the background just now, as every effort is to be made to complete the autograph arrangement, so as to have it used on some line.

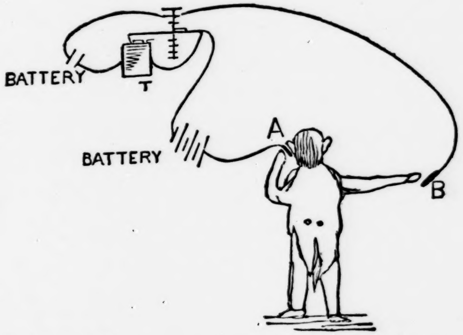
"The two patents for the transmission of musical notes are not decided yet. I can't understand why the interference should not have been declared before this.

"Here are some late discoveries: 1. The current from one of my instruments passed through an iron wire causes a musical note to issue from the wire. 2. The same effect is produced by passing the current through a piece of carbon. 3. Ditto when it is forced through the plumbago of an ordinary lead pencil ! ! ! No similar effects noted yet with copper, brass or mercury. A still more curious phenomenon is the following:

"Two thin strips of brass (A and B) are connected with the wires coming from my transmitting instrument, T, and from the battery. On holding A to my ear I hear nothing but the moment that I touched B with my finger a musical note is heard to proceed from A!!

"Truly, the more I study electricity and magnetism the more I feel the truth of Hamlet's saying, 'There are more things,' etc.

"I fear that this telegraphic business may force me to remain the greater portion of the summer here, but I can not tell yet, so many details have to be worked out. My inexperience in such matters is a great drawback. However, Morse conquered his electrical difficulties although he was only a painter, and I don't intend to give in either till all is completed. "With dear love, your affectionate son,



"ALECK."

Mr. Bell had also, during the preceding winter, observed another remarkable acoustical and electrical phenomenon, which he described in the following letter written to Dr. Blake (C. Vol. 4 Exhibits, page 967):

"SALEM, MASS., December 15, 1874.

"*My Dear Sir:* I have been unwell for some days past or I should have written to you.

"I have this afternoon made a curious discovery, if indeed further experiment confirms it, and I want your assistance in the matter.

"When we take hold of the handles of an ordinary electro-magnetic machine, the muscles of our arms are made to *vibrate* at a rate corresponding to the making and breaking of the primary circuit.

"Now, the thought struck me that if we could make the direct and inversed induced impulses succeed one another as regularly as the crests and depressions of waves, then an electrode applied to the ear so as to induce a vibration in the membrane tymp., *should create the sensation of sound without the aid of any intermediate apparatus.*

"I have had an instrument made, and the experiment seems a success.

"A number of permanent magnets were arranged upon a cylinder (see illustration) which was revolved in front of electro-magnets.

"On filling my ears with water and applying the wires (protected of course) as in the diagram, a soft musical note was heard.

"The sound stopped the moment the electrical circuit was broken.

"The wires employed were very short, so that the noise of the rotating cylinder (conducted mechanically along the wire) almost drowned the musical note. The latter thus appeared like an *overtone.*

"Two ladies who were present submitted to the experiment, and heard the note as clearly as I did. A gentleman, however, (who could not distinguish overtones in music,) heard nothing more than the *noise.*

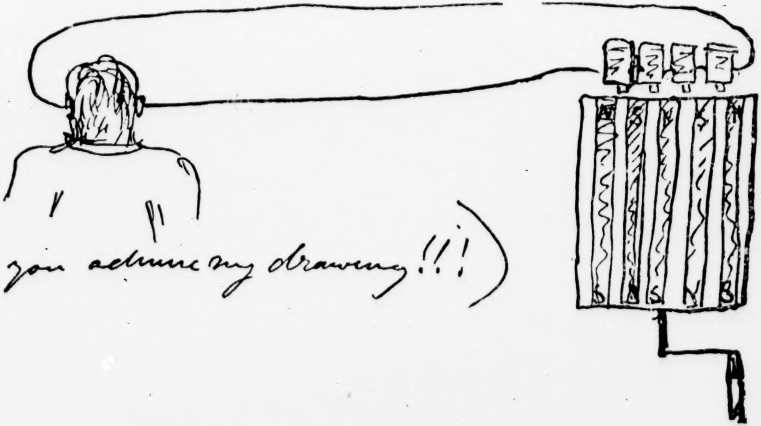
"I want your co-operation. Can we arrange for a meeting on Saturday morning at your rooms?

"I am anxious to see the results of your experiments.

"Yours sincerely,

"A. GRAHAM BELL.

"DR. C. J. BLAKE,
"Hotel Berkeley."



(I hope you admire my drawing!!!)

XI.

THIRD PERIOD.

We now come to the third period in the history of the development of Mr. Bell's invention, a period characterized by his labors toward the practical application of directly induced currents of electricity to the purposes of multiple telegraphy, and in addition, to the transmission of articulate speech.

Mr. Bell's efforts were turned in this direction by a discovery made by him June 2, 1875, as mentioned in the following letter written by him to Mr. Hubbard (C. Vol. I, page 136):

"SALEM, MASS., June 2, 1875.

"*Dear Mr. Hubbard:*

"I have accidentally made a discovery of the very greatest importance in regard to the transmitting instruments. Indeed, so important does it seem to me, that I have written to the organ factory to delay the completion of the reed arrangement until I have had the opportunity of consulting you.

"I have succeeded to-day in transmitting signals without *any battery whatever*.

"The musical note produced at the receiving end was sensibly the equivalent of that at the transmitting end in *loudness* as well as pitch.

"I shall call upon you to-morrow (Wednesday) evening, as there are several matters I wish to talk over with you. In haste. Yours, respectfully,

"A. GRAHAM BELL.

"GARDINER G. HUBBARD, Esq., Battle street, Cambridge."

The incident is related as follows (C. I, page 136):

"Int. 71. Did you on the 2d of June, 1875, perform the experiment stated in that letter? And if so, state where, and describe the experiment fully.

"Ans. I did. The experiment was made in the upper part of Mr. Williams' building, No. 109 Court street, in two small rooms that Mr. Williams had allowed me to use for experimental purposes.

"I was carrying on a series of experiments for the purpose of perfecting for practical use my system of autograph telegraphy which was a development of my harmonic telegraph. I had arranged three experimental stations upon a single line wire, which, for convenience of reference, I shall designate A, B and C. At station A were arranged a number of current interrupters whose rates of vibration were different, and a number of telegraph keys corresponding to the interrupters. By the depression of any key the intermittent current from the corresponding interrupter was directed on to the line wire to the stations B and C. At each station, B and C, were placed harmonic receivers corresponding in pitch to the interrupters at station A. Each receiver consisted of a horseshoe electro-magnet, to one pole of which was clamped one end of a steel reed, the free end of which projected over the other pole of the magnet. A coil of insulated wire surrounded that leg of the magnet which was presented to the free end of the reed. Stations A and B were in one room and station C in the adjoining room.

"I took charge of stations A and B during the experiment referred to, and Mr. Thomas A. Watson took charge of station C. We were making an experiment to ascertain whether the receiving reeds were properly tuned to their corresponding interrupters, and whether the operation of one interrupter interfered with that of the others when the keys were simultaneously depressed. I pressed down one key at station A and observed whether the proper reed at station B was thrown into forcible vibration, and Mr. Watson observed whether the proper reed of station C was similarly affected.

"Upon trying all the keys in succession, it was found that one of the receivers at station C failed to respond. As we very often found that the magnets of the receivers were so closely adjusted to the reeds that the reeds would stick to the pole when a powerful current was passed, I thought that this might be the cause of the failure in the present case. I therefore called out to Mr. Watson to pluck the reed with his finger. He did so, and I imagined the corresponding reed of station B was thrown momentarily into vibration. I was struck by this, as I had not depressed the key of the corresponding interrupter, and could not see where the current came from to operate that receiver. I therefore requested Mr. Watson to pluck the reed at station C a number of times, and found that I had not been mistaken in my observation. To test the matter still further I removed station A from the circuit altogether, and connected the receivers of B and C upon a closed circuit without any battery. Upon plucking with the finger any reed of station C, it was found that the corresponding reed of station B was thrown into sympathetical vibration and *vice versa*. I then requested Mr. Watson to pluck one of the reeds of station C a number of times, while I placed my ear against all the reeds of station B in succession. I could hear from each reed the peculiar tone of the reed plucked at station C, and recognized that the *timbre* of the plucked reed had been reproduced. We then placed a single receiver at station C in circuit with a single receiver at station B, and repeated the experiments. The results were much more marked. Upon plucking the reed at station C, its sound was reproduced by that at station B; and upon plucking the reed at station B, its sound was reproduced by that at station C. When the two reeds employed were in unison with one another, the plucking of one resulted in the visible vibration of the other, the amplitude of vibration often being considerable. No battery was used. Upon placing a battery in the circuit, the same effects were observed and the results were more marked."

The *discovery* thus made is first stated by Mr. Bell in his Preliminary Statement in Speaking Telephone Interferences in 1878, as follows: (C. Vol. IV., Exhibits, page 1007.)

"At once, my speculations in Canada, in the summer of 1874, occurred to my mind, and I saw that I had been hasty in coming to the conclusion that the magneto-electric currents, induced by the vibration of a plate or spring, would be too feeble to set corresponding armatures in vibration so as to produce audible effects; for in the experiment I had just made, the residual magnetism of the armature and core of the electro-magnet, though it must have been exceedingly slight, was able, when the spring was thrown into vibration, to induce a current sufficiently strong to set the armature of the other instrument in the circuit into visible vibration so as to produce audible effects.

"It will be noticed that the apparatus I have just described, is essentially the same as that represented in Fig. 5 of the drawings annexed to the patent granted to me March 7, 1876, and numbered 174,465, which is the subject of this interference, excepting that a battery is included in the circuit in the drawing, to give a greater amount of magnetism in the core of the electro-magnet. I did, in fact, on the second day of June, 1875, repeat these experiments with a battery included in the circuit, and then completed so much of the invention embraced in that patent as is represented in said Fig. 5.

"My mind immediately recurred to the use of a membrane as a means of operating an armature so as to correspond with the vibrations of the air caused by vocal sounds; and either on the same day, or shortly after, I gave orders for the construction of two instruments in which the armature of an electro-magnet should be moved by the vibrations of a stretched membrane, to which it was connected. Such an instrument was constructed by Mr. Watson during the month of June, 1875, but I am unable to fix the exact day."

In his deposition in the *Dowd* case in 1879, it is stated as follows: (C. Vol. I, page 139.)

"Ans. 74. The experiments made on the 2d of June, 1875, referred to above, solved the difficulty that had been in my mind since the summer of 1874, in regard to the practical operation of the various instruments I had devised for the reproduction of vocal utterance by electrical means. I had had the idea that magneto-electric currents generated by the vibration of permanent magnets, as reeds would be too feeble to produce any useful practical results. But the experiments above described, assured me that I had been mistaken in this idea, and I immediately upon this same 2d of June, 1875, gave instructions to Mr. Watson to have my membrane arrangement constructed."

And upon cross-examination at that time as follows: (Ibid. page 189.)

"Cross-Int. 231. Please, now briefly describe that discovery again. Ans. The discovery was that the magneto-electric current produced by the vibration of a steel reed or of a permanent magnet, in front of an electro-magnet, was sufficiently powerful to be utilized for the production of sounds by electric means."

And upon the cross-examination in 1883, as follows: (C. Vol. 2, page 1590.)

"Ans. 317. *The Discovery.* The discovery, therefore, that was made on the 2d of June, 1875, was that the vibrations caused in the armature of a receiving instrument by electrical undulations occasioned by the vibration of the armature of another instrument in the same circuit as the first, would be of very considerable force. As I have already explained, I had had the idea since the summer of 1874, that vibrations produced in this way would be of very slight amplitude, and that they might not prove sufficiently violent to produce audible effects, that would prove practically useful either for the purpose of the reproduction of articulate speech, or for the purposes of multiple telegraphy.

"The experiments described above convinced me that this was a mistake. The vibrations produced in tuned reeds were so great in amplitude that I felt sure that they were even sufficiently great to be mechanically utilized in my system of multiple telegraphy. Even when the reeds of the two instruments connected in circuit as shown in Fig. 5 of my patent of March 7, 1876, (but without a battery) were not in tune with one another, that is, did not have the same normal rate of vibration, the feeble forced vibrations electrically produced in the one by the mechanical plucking of the other, though barely sufficient to produce a visible motion, were quite sufficient to cause a very perceptible sound. I placed my ear against the reed of one of the instruments, while Mr. Watson plucked the reed of the other, and distinctly heard a musical tone at every pluck, the pitch of which was not that normally produced by the instrument at my ear, but was the pitch of the other which had been plucked by Mr. Watson. In this experiment also, the effects were perfectly well produced without any battery upon the circuit, and without any other source of permanent magnetism, than the feeble charge in the thin steel spring armature that would probably be caused by previous experiments with batteries, or the residual magnetism of the soft iron cores due to the same experiments.

"These results, therefore, satisfied me that I had very much underrated the power of undulatory electrical currents produced by the vibration of an armature to produce audible sonorous effects, and convinced me in a moment that the speaking telephone I had devised in the summer of 1874, would, if constructed, prove a practically operative instrument."

Thus by a happy accident, which might have escaped the notice of a less attentive observer, Mr. Bell was led to the discovery that he had all along been "hasty" and "mistaken" in coming to his previous conclusions; that he had "very much underrated the power" of these induced electrical currents; and, on the other hand, and possibly put in its mere positive aspect, "that the magneto-electric current produced by the vibration of a steel reed or of a permanent magnet, in front of an electric-magnet, was sufficiently powerful to be utilized for the production of sounds by electric means."

This undoubtedly came to Mr. Bell as with the force of a revelation, and seemingly brought within the range of actual possibility plans and methods of operating by induction which he had hitherto regarded as wholly impracticable except in theory.

And, first, as regards the application of this magneto-electric current to multiple telegraph purposes, it would enable him to operate his instruments upon a closed circuit and with free earth communication at both ends of the line, thus securing the transmission of messages singly or simultaneously in both directions. Moreover, from the peculiar nature of the current employed, he would be greatly relieved from the difficulty, encountered in the use of induction coils with circuit-breakers, of getting "interrupters so tuned as not to interfere with one anothers action;" and accordingly a much larger number of messages could be transmitted simultaneously on the same circuit.

Mr. Bell, in his intense rivalry with Mr. Gray at this period, undoubtedly appreciated these and the other advantages that would result from the application of directly induced currents to a system of multiple telegraphy. While orally, in the record, he is, as perhaps would be expected, somewhat reticent upon the subject, the documentary evidence introduced shows clearly that during the month of June at least, if not in July as well, he devoted considerable time and attention to the practical development of instruments provided with tuned reeds to be mechanically vibrated for this purpose.

Of the four letters subsequently written by Mr. Bell to Mr. Hubbard, during the months of June, July and August, 1875, and which are produced in evidence, two of them refer to this subject, while the other two refer to the transmission of vocal sounds. The two letters first above referred to are as follows: (C. Vol. 1, pages 141 and 146.)

"SALEM, MASS., June 28, 1875.

"*Dear Mr. Hubbard:*

"Mr. Hutchins (the organ builder) kindly devoted the whole of this afternoon to the construction of a steel reed for me.

"One of the latest receiving instruments was inclosed in a wooden box, and had its armature so arranged as to be set in vibration by a current of air passed through the box. The instrument was completed this evening in time for trial. Mr. Hutchins operated the reed in a little room up stairs (Williams' office), while I observed the effect upon a receiving instrument placed in the basement of the building. The sound was so perceptible that I found it unnecessary to place my ear against the instrument. The vibration of the armature could also be seen and felt.

"No battery or permanent magnet was used.

"I feel sure that a study of Ladd's or Wilde's magno-electric machine will reveal a means of increasing the intensity of the induced currents. I am told that Prof. Lovering has one of Wilde's instruments in his possession, so I shall call upon him to-morrow for information concerning it.

"Prof. Pickering has left town for the summer. I propose having the steel reed still further altered tomorrow, so shall probably be at the organ factory (Hutchins, Plaisted & Co., Cambridge street, near Charles street) most of the afternoon instead of at Williams,' shall call in the evening and report progress.

"Yours respectfully,

"A. GRAHAM BELL.

"GARDINER HUBBARD,

"Brattle Street, Cambridge:

"P. S. The experiment referred to above was repeated when a single cell of a battery had been placed in the circuit. The amplitude of vibration of the armature downstairs was quite large enough to work the vibratory circuit-breaker. We were unable to try higher battery power on account of the sticking of the generating armature. When the instrument is altered tomorrow I shall try higher battery power and test the resistance through which the current will pass.

"A. G. B.

"SALEM, MASS., Wednesday, July 7, 1875,

"*Dear Mr. Hubbard*:

"I forgot to mention this evening the gratifying results obtained with the steel reed.

(Cut.)

"When three cells of a battery were introduced into the circuit (as shown in the figure), the armature of the receiving instrument vibrated with considerable amplitude.

"When a damper was adjusted for it to strike against, the sound could be heard at a distance from the instrument.

"The helix at transmitting end had a resistance of about two ohms, and yet the vibration of the armature of the receiving instrument could be detected when a resistance of 100 ohms was introduced into the circuit. This seems to me to indicate more power than possibly be due to magno-electric currents, generated by vibration of the reed.

"May not a pulsatory action be induced in the *voltaic current itself* by the motion of the reed? I can imagine the current alternately weakened and strengthened according to the distance of the armature from the pole underneath.

"In this case the pulsations would certainly be available for our purpose, by merely increasing the battery power sufficiently to overcome the resistance of the line. Magno-electric currents are, however, evidently present, for a sound is perceptible at the receiving end when the battery is omitted altogether.*

---

* In regard to the use of a battery in connection with the induced magneto-electric current, Mr. Bell has repeatedly expressed his views.

In his London lecture (C. Vol. 4, page 903) he said:

"The new form of instrument is that shown in Fig. 27, and, as had long been anticipated, it was proved that the only use of the battery was to magnetize the iron core of the magnet, for the effects were equally audible when the battery was omitted and a rod of magnetized steel substituted for the iron core of the magnet."

In his Preliminary Statement, in Speaking Telephone Interferences (C. Vol. 4, page 1007), he said:

"It will be noticed that the apparatus I have just described is essentially the same as that represented in Fig. 5 of the drawings annexed to the patent granted to me March 7, 1876, and numbered 174,465, which is the subject of this interference, excepting that a battery is included in the circuit in the drawing, to give a greater amount of magnetism in the core of the electro-magnet."

"Ans. 147. My original idea, in the summer of 1874, was to transmit sounds by means of magneto-electro currents without a battery; and from the time of the first conception of the speaking telephone, I had the belief that the apparatus could be operated by substituting a permanent magnet for the soft iron core of the electro-magnet.

"Int. 148. Then why did you use a battery with your speaking telephone?

"I think also that the effects are in some way dependent upon the peculiar form of electro-magnet employed. I hope to get some light on the subject from Moncel. He devotes several pages to the discussion of peculiarities observed in the one-legged or 'lame' magnet (boiteux) shown in his work as follows:

(Cut.)

"He says: 'Ce genre d'electro-aimant, que j'ai beaucoup étudié et le premier employé dans les applications électriques, a beaucoup d'avantages dont nous parlerons plus tard, et une force beaucoup plus considerable qu'on ne semblerait le croire à première vue ——,

With kind regards,
Yours respectfully,
A. GRAHAM BELL.

GARDINER HUBBARD, ESQ.,
Brattle street, Cambridge."

In C. Vol. IV Exhibits, pages 973 to 976, there appears as an exhibit "Bell's Memorandum of Experiments of June 30, 1875," which also relate directly to the subject of multiple telegraphy.

Mr. Bell testifies regarding the experiment referred to in the above letter of June 28th, relating to the instrument

---

Ans. Because the effects obtained were much more powerful with a battery than without; and because I had the idea that in operating the instruments through any considerable resistance, as upon a real telegraph line, the battery would produce the most practically useful results." (C. Vol. 1, page 165.)

Complainants' expert, Mr. Charles R. Cross, testified as follows (C. Vol. 1, page 33, Ans. 12):

"The magnets *b* and *f* in Fig. 7 are electro-magnets having soft iron cores, which cores are magnetic only when a current of electricity is passing through the coils surrounding them. The object of the battery shown in Fig. 7 is simply to produce this current, which shall cause the cores to be kept magnetized."

And again (Ans. 20 Ibid, page 40):

"They do not, since the function of the battery represented in Fig. 7 of Mr. Bell's specification is merely to keep the cores of the electro-magnets magnetic. When permanent magnets are employed the permanent magnetism of such magnets is substituted for the magnetization produced by the battery current."

Mr. Bell's idea appeared to be that the magneto-electric currents were present on the line and did the work, for the sound was perceptible when the battery was omitted altogether. He would merely increase the battery power sufficiently to overcome the resistance of the line and leave the magneto-impulses flowing alternately in opposite directions free course upon the wire, to accomplish their work.

which "had its armature so arranged as to be set in vibration by a current of air passed through the box," and upon the subject in general, as follows (C. Vol. I, page 142):

"Int. 80. Did you, before writing that letter, perform the experiments therein described with the results therein stated? Ans. I did.

"Int. 81. The letter speaks of the production of sound when no battery and no permanent magnet was used; what generated the electric current or impulse in that case? Ans. The vibration of the armature acting upon the residual magnetism of the electro-magnet and armature. The instrument had been previously used in connection with a battery, and the core of the electro-magnet and the armature retained a slight magnetic condition.

"Int. 82. During the month of June, 1875, and before the construction and use of the second membrane telephone, did you try any experiments in which electric currents were generated or effected by the vibration of a reed in front of an electro magnet: and if so, to what extent and for what purpose? Ans. I was constantly occupied during the month of June, 1875, in experimenting to ascertain the best arrangement of coil, magnet and armature for generating electric currents in the manner indicated."

The outcome or result of these experiments, especially in the development of the novel theory of the simultaneous transmission of a large number of telegraphic signals without their interference, because of the undulatory character of the current thus employed, and of its consequent peculiar capacity in this respect, is a subject upon which little or no additional light can be obtained in the record.

This whole matter, however, was so clearly set forth by Mr. Bell in the specification of the patent subsequently applied for, and with such fullness of detail and elaborate explanation, that any further discussion of the subject possibly seemed wholly unnecessary.

XII.

But although Mr. Bell thus developed to the fullest extent the discovery of June 2, 1875, in its bearing upon his system of multiple telegraphy, it had for him a far deeper and more important significance. It revealed to him the starting fact that he had all along been laboring under a gross error in regarding the supposed feebleness of the induced electric currents as the one *insuperable* obstacle to their practical application to the transmission of speech.

At once his original theory, beautiful in its conception and perfect in the logical sequence of its reasoning, and over which he had been "thinking and dreaming" all the year, was vivified and quickened into vitality, as by a flash, by being thus suddenly brought within the range of possibility and of actual realization.

The other difficulties, though great, could not be regarded as insuperable, and we can readily imagine his enthusiasm, when, animated by his new faith, he realized that the time had now come when the "thought" and the "dream" must give place to *action*, and when, accordingly, for the first time in his life, he addressed himself to actual experimental work, in the effort to accomplish the practical development of his theory.

There was work to be done, and work calling for the exercise of the utmost ingenuity and calling into play the very highest powers of practical invention.

The fact he had observed was simply this: that when two or more of his electro-magnet receivers were placed in a closed circuit, with or without a battery, and the armature reed of one of the receivers was thrown *mechanically* into vibration, the induced currents were sufficiently powerful to throw that reed of a receiver which was tuned in unison, into visible vibration, while by placing the ear close to each of the receiving reeds a tone could be heard corresponding to the tone of the "plucked" reed.

This was just the instrumentality he required for the purposes of multiple telegraphy, while obviously it fell far short of meeting the requirements of a speaking telephone.

The clamped reed of the transmitter, tuned to a definite pitch, could only transmit a musical note of the same pitch, and it could only do this when it was set into vibration by the direct application of an appreciable mechanical force. But on the other hand, a speaking telephone must be able to transmit the whole range of musical tones and consonant sounds as well, together with the inflections and modulations of the voice, in a word, all the qualities of articulate speech. This must be done, too, without the direct application of any considerable mechanical force, and simply by the power of the human voice transmitted through the air.

Mr. Bell was, therefore, still confronted by the identical practical problem, with the perplexities of which, as we have seen, he had all along been contending theoretically. How was he to combine and arrange appropriate instrumentalities so that, on the one hand, the armature should be provided with a considerable surface, so as to receive the utmost possible motive force from the impact of the air particles, and at the same time make the arrangement so light and delicate that the slight force of the air would readily overpower the latent force tending to compel a vibration only at a definite normal rate, and so accurately sensitive that it would instantly respond, not only to the simple vibrations of the air particles, but to the almost infinite variations occurring in every part of each vibration. All this was requisite, as otherwise, and without this arrangement, the *quality* of speech could not be transmitted.

While, on the other hand, and in very antithesis to the foregoing essential conditions, the arrangement must necessarily be provided with, and carry through every variation of its movement, a body of inductive metal of sufficient size and weight to induce, by its motion in front of an electro-magnet, electrical impulses of such power as to force the receiving armature into vibrations audible to the ear, in an appreciable reproduction of the original speech. Otherwise, even if the first mentioned conditions were fulfilled, the apparatus would possess only a scientific interest in illustration of a beautiful theory, while it would be practically worthless as a telephone.

The knowledge that Mr. Bell had newly acquired was very valuable. He had learned the fact that a steel reed, by the direct application of an appreciable mechanical force, could be vibrated with sufficient inductive power to produce magneto-electric currents strong enough, operating through an electro-magnet in the receiver, to set its armature into audible vibration.

This was, however, by no means, a knowledge that there was sufficient power and motive force in the human voice, transmitted through the air, to reproduce speech in like manner. Nor, much less, was it a knowledge of the requisite arrangement of instrumentalities which would enable the voice to do this work.

But, on the other hand, the knowledge Mr. Bell had gained undoubtedly revealed to him, then and there, that it was not an *impossibility* that there might be such power in the human voice, and further, that means might possibly be so combined and arranged as to effectually utilize this power in the actual transmission of speech electrically. Mr. Bell unquestionally felt that at last he held within his grasp possibilities capable of extraordinary development; and *faith*, coming to his aid, supplied the place of knowledge, and inspired within him the conviction that this magneto-electric current, generated by the vibration of the armature of an electro-magnet in front of one of its poles, was indeed the very key to the ultimate solution of the great problem of the electrical transmission of speech.

And in this faith he applied himself earnestly to the difficult task of constructing an apparatus which, by its actual fulfillment of all the onerous conditions of the problem, should form a practical embodiment of his great principle in a working speaking telephone.

He, of course, soon found that the inherent difficulties of the task were greatly enhanced by the fact that he was entering upon the domain of what was practically an entirely new "art," without any accepted standards and without any technical lore, and where, indeed, there could be absolutely none "skilled in the art" to whom he could apply for aid. He was pushing out into a *terra incognita*, where he must himself develop every necessary expedient, and arrange instrumentalities in combinations so novel that he must for himself discover and apply all those underlying laws and principles through the application of which only could the combinations be made effective for his purpose.

So far as knowledge was concerned, Mr. Bell was admirably equipped for the work.

While he modestly did not profess to be a skilled electrician, Mr. Bell, while yet in England in 1867, "took up seriously the study of electricity," and for eight years thereafter, he had continued its special study and investigation, both by way of research and by practical experiment. His long and patient labors toward the development of his system of multiple telegraphy which operated upon the essential principle of the electrical production of sounds of a specific character in a magneto receiver, together with his special research into the phenomenon of the production of sound by the passage of a current of electricity through iron, steel, mercury and other substances, placed at his command a special knowledge rarely equalled. His labors in the study and the application of methods of electrical *induction* to the purposes of multiple telegraphy, by the use of induction coils, revolving bar magnet cylinders &c., and, in particular, the knowledge gained by the experiments of June second, in the production of sound by means of directly induced magneto-electric currents, undoubtedly carried Mr. Bell even beyond the boundaries of what was previously known in the science, at least so far as it related to the application of induced currents of electricity to the transmission of sound.

In the science of acoustics, the study of a lifetime in the line of his professional labors, and, especially, the close attention he had paid to the great work of Helmholtz, together with his subsequent researches with the phonautograph, had made him confessedly master of the subject.

As regards his knowledge of the nature of the difficulties to be encountered, and of the conditions which must be fulfilled to insure success, his reported conversations with Prof. Henry and with Dr. Blake, and his long continued theoretical study of the subject indicate unmistakably that he was not deficient in this respect.

As regards a knowledge of the available motive force contained in articulate sounds transmitted through the air, and of the mechanical effects that might be produced by the application of this force to a diaphragm, and of practicable methods of effecting this application, very little could be known by anyone at that time. As Mr. Pope has well said in the passage already quoted from his deposition:

"Very little was known at that date as to the actual mechanical effects which were capable of being produced by the sonorous atmospheric vibrations accompanying the production of ordinary sounds, such for example, as those produced by the human voice. Perhaps the only application of this force to produce an appreciable result, which was at all well known at that date, was the phonautograph, so-called, in which the vibrations of a membrane, produced by sound waves, were made to move a bristle over a surface of smoked glass through a very small range of vibration. The power required to effect this was inconsiderable in amount." (C. Vol. 2, 1293.)

But the little that was to be known upon this subject Mr. Bell had long before acquired, and had then made it peculiarly his own possession by actual practice and repeated experiments.

This is set forth at length in his deposition, as follows (C. Vol. 1, page 114):

"Int. 23. When, if ever, did you become familiar with the Scott phonautograph, referred to in Prof. Cross' twenty-eighth answer, page 395?

"Ans. In the winter of 1873-4.

"Int. 24. Did you, during that winter, construct any phonautographs yourself?

"Ans. I did; early in 1874.

"Int. 25. In those that you constructed, how was the rod which carried the style attached to the phonautograph frame, and how was it moved by the membrane?

"Ans. One end of the rod was hinged by means of a piece of leather to the edge of the circular frame carrying the membrane. A small piece of cork was fastened to the center of the membrane and to the rod. Upon uttering a sound in the neighborhood of the membrane it was caused to vibrate, and force the rod to vibrate also. The free end of the rod projected considerably beyond the opposite edge of the membrane, and its vibrations were recorded on smoked glass.

"Int. 26. Did you use in your phonautographs a paraboloidal mirror to concentrate the sound waves between the speaker and the membrane; if not, what form did you give to that part of the apparatus which conducted the sound waves from the mouth of the speaker to the membrane?

Ans. I did not use the paraboloidal mirror excepting in experiments with Prof. Cross, at the Institute of Technology, with the instrument he has described in his deposition. In all the phonautographs constructed by myself in the early part of 1874, I used a rubber tube, with a mouthpiece similar to those employed in speaking tubes.

"Int. 27. Whether or not during that winter you devised any apparatus for reproducing, by means of phonautograph sound tracings, sounds similar to those which had made the tracings; and if so, describe what it was and how it was to operate? Ans. I did. A phonautograph tracing was to be drawn on a hollow metallic cylinder, so arranged as to be capable of rotating on a vertical axis. The tracing was then to be cut so as to form a sinuous slit, and air was to be blown through the tracing from a pipe whose nozzle was contracted to a vertical slit. A pencil of air would thus be expelled at the points of intersection, and the rotation of the cylinder would cause this pencil of air to vibrate in the same manner as the air had been moved by the voice of the speaker when the original tracing had been made. I presumed, therefore, that the rotation of the cylinder would cause a sound to be heard similar in quality to that which had produced the tracing.

"Int. 28. Did you construct such an apparatus at any time? Ans. I did not.

"Int. 29. Did you, during the year 1874, use any phonautograph of an entirely different character from those which you have described, and if so, what was it? A. I used during the year 1874 a phonautograph which was made from a human ear. The middle ear was exposed by dissection, and a style of hay was attached to the end of the *incus* in place of the *stapes*. Upon uttering sounds into the external ear, I found that the hay attached to the *incus* vibrated sufficiently to enable me to obtain tracings of vocal sounds upon smoked glass."

"Int. 40. What experience had you had in vibrating, by means of the human voice, membranes which were so loaded or arranged that some work had to be done by the sound waves besides moving the membrane itself? A. I had made many experiments with phonautographs in which membranes operated by the human voice had not only moved levers of considerable length, at a mechanical disadvantage, but had caused such levers to perform considerable mechanical work in scraping lampblack from glass slides so as to form enlarged tracings of the aerial vibration.

"I was also familiar with Koenig's Manometric Flame Apparatus, the membrane of which was caused by the voice to vibrate against the pressure of gas admitted into the capsule from the ordinary gas pipes, so as to create a sensible vibration in the flame at the orifice of a capillary tube. At the very time also when this conception occurred to me ("that a single reed could be moved by the voice of the speaker in this manner by attaching it to a stretched membrane, and speaking against the membrane." Ans. 39), I was obtaining tracings of the vibrations of the bones of the human ear, and I reasoned that the disproportion in mass between the tympanic membrane and the bones that were moved by it was much greater than that existing between a membrane like that used in the phonautograph and the reed which I propose to operate by it."

As regards the ability to compass the details of mechanical construction, Mr. Bell had a practical experience, extending through the preceding two years, in experimental work, both upon multiple telegraph instruments, and especially in the construction and operation of phonautographs, in which art, apparently, judging from his testimony, he regarded himself as an "expert." Moreover, he had at this time the able assistance of a skilled electrical workman, Mr. Thomas A. Watson, whose qualifications are stated in his deposition (C. Vol. I, page 200) as follows:

"Int. 1. Please state your name, age, residence and occupation. A. Thomas A. Watson; twenty-five; Boston, Mass.; general inspector of the National Bell Telephone Company.

"Int. 2. When and how did you first become acquainted with Mr. A. G. Bell? A. By making instruments for experimental purposes for him, in the winter of 1874–5, at Charles Williams, Jr's, manufactory, 109 Court street, Boston.

"Int. 3. What knowledge or experience had you then relating to electricity and electrical apparatus? A. What I had gained by nearly two years' practical experience in Mr. Williams' manufactory, making electrical instruments, and also by study of various works on electricity and magnetism."

But notwithstanding Mr. Bell's admirable equipment for the task, we must not be surprised, now that we have some real appreciation of the difficulties which had to be met and overcome, should the fact subsequently be developed that in 1875 and prior to the date of his patent, March 7, 1876, he had utterly failed to solve the practical problem, to the solution of which he had addressed himself with such hopefulness on that memorable June second. Nor need it occasion much wonder should it become manifest that, instead of attaining to a practical embodiment of his principle in a working speaking telephone, he found at the end of his experiments and after all his efforts had been exhausted, that he had been unable to construct an apparatus by the use of which either he himself, or any one else, had been able to transmit even a single word of articulate speech.

And yet the fact will possibly be found to be established not only by a preponderance of evidence, but unquestionably, and even beyond a reasonable doubt.

XIII.

The earliest narrative of the efforts made by Mr. Bell toward the accomplishment of his undertaking during the month of *June*, 1875, contained in the record, is given in his Preliminary Statement in Speaking Telephone Interferences as follows (C. Vol. IV Exhibits, page 1008):

"My mind immediately recurred to the use of a membrane as a means of operating an armature so as to correspond with the vibrations of the air caused by vocal sounds; and either on the same day, or shortly after, I gave orders for the construction of two instruments in which the armature of an electro-magnet should be moved by the vibrations of a stretched membrane, to which it was connected.

"Such an instrument was constructed by Mr. Watson, during the month of June, 1875, but I am unable to fix the exact day.

"Upon putting it into circuit with a battery, the strength of the magnet and the weight of the armature were such as to tear the latter from the membrane, which was composed of goldbeater's skin. Portions of this membrane are still in existence, and I annex a drawing, marked "A," which corresponds in size to the parts now in my possession, and which correctly represents, as I believe, the instrument as originally constructed. So far as I can recollect, it was not until the first of July, 1875, that we were able to get the instrument in condition for trial. I fix this date, and the nature of the experiment, by a letter which I wrote on that day, a copy of which is as follows:

"SALEM, MASS., July 1, 1875.

"*Dear Mr. Hubbard:* The experiment to which I alluded when I saw you last, promises to be a grand success. In singing this afternoon in front of a stretched membrane, attached to the armature of an electro-magnet, the varying pitch of the voice was plainly perceptible at the other end of the line, no battery or permanent magnet being employed. When the vibrations are received upon another stretched membrane in place of a steel spring, it is possible —nay, it is probable—that the "timbre" of the sound may be perceived. I hope to try the experiment to-morrow afternoon. This morning, in dipping into a French work upon telegraphy, I came across a full description of the "Typo—Télégraphe de M. Bonelli." I find it to be *identical* with our autograph arrangement, save that five telegraph wires are required instead of one for transmission. Bonnelli gets over the difficulty of *prepared* ink by setting up his message in type. The brush of wires is passed over the raised surfaces of the letters, securing perfect contact at the proper places. I have an engagement to meet Prof. Lovering to-morrow morning at ten o'clock, and shall call upon you before returning to town.

"With kind regards,

"A. GRAHAM BELL.

"GARDINER G. HUBBARD, Esq.,
"Brattle Street, Cambridge."

"I have not seen this letter since I wrote it, until within three days and I had forgotten that I had made any such record of this experiment. It is obvious from this letter that the effects produced must have been due to the residual magnetism remaining in the armature after having been previously magnetized by the passage of a battery current.

"Another instrument with stretched membrane was immediately constructed, and the experiment, spoken of in said letter was tried, of transmitting speech."

Some additional details are given in his deposition in the *Dowd* case as follows: (C. Vol. 1, page 139.)

"Ans. 74. But the experiments above described, assured me that I had been mistaken in this idea, and I immediately upon this same 2d of June, 1875, gave instructions to Mr. Watson to have my membrane arrangement constructed. One of the reeds employed in our experiments upon that day was to have been hinged to the pole of its electro-magnet, instead of being clamped, and the free end of the reed was to have been attached to the centre of a stretched membrane; a duplicate was to have been constructed as a receiver. One of the instruments was constructed within the next few days; but instead of hinging the steel reed, as I had intended, Mr. Watson used a thick armature which was pivoted to the pole of its electro-magnet. Portions of this instrument are still in existence, and I now produce them. I produce a duplicate of the original instrument. This duplicate has recently been constructed. The armature now upon the duplicate instrument is thinner than the original armature, and I now produce a duplicate of the original armature. The parts of the original instrument which I have, are as follows: The wooden ring and wooden tube upon which the membrane was stretched, the original armature and electro-magnet and the cross-bar to which the magnet was attached, the uncovered leg of the magnet, to which the armature was attached, was removed a day or two after the original instrument was constructed and another substituted for it. The pole of the uncovered leg was filed to an edge, and a steel reed was hinged to it by means of a strip of leather. This substitute is the one now attached to the original magnet produced."

"Int. 77. How soon after the 2d of June, was the instrument described in your seventy-fourth answer made, when and where was it tried, and with what results? Ans. I was anxious to try the instrument at once, and could not wait to have the duplicate receiver made; so, immediately upon its construction, I attempted to use it with one of my harmonic receivers. Upon passing a battery current through the coils of the instruments, however, the attraction of the magnet was so great as to tear the heavy armature away from the membrane. Mr. Watson and I made a number of experiments with other membranes in place of the original, and I remember that we were enabled to use the instruments for a practical experiment at least upon one occasion. The stretched membrane arrangement was placed in one of the rooms in the top part of Mr. Williams' building, and an ordinary harmonic reed receiver in the lower workshop. I do not now remember whether any battery was used, but it is my impression that in consequence of the accidents to our membranes we made the experiment without a battery. I distinctly remember shouting into the stretched membrane instrument, while Mr. Watson was down stairs listening, with his ear pressed against the reed of the harmonic receiver. I do not remember definitely what the results were, excepting that I was encouraged by them to reconstruct the instrument with a lighter armature. I can not fix the exact date of the experiment, and only know that it was during the month of June 1875.

"Int. 78. What difficulty did you find from the heavy armature which led you to try a lighter one? Ans. The armature was so strongly attracted by the electro-magnet as to be frequently torn from the membrane, and I presumed that a lighter armature would not only be less attracted, but would also be more easily moved by the membrane and would not be so liable to become detached.

"Int. 84. Did you at or about the date of that letter (of July 1, 1875, to Mr. Hubbard, already quoted) cause to be constructed a second membrane telephone; and, if so, when, and have you any of the parts of it? Ans. The same day I wrote this letter, namely, July 1, 1875, I gave instructions to Mr. Watson to have constructed a second membrane telephone. The instrument was completed a day or two afterward, and some parts of it are still in existence and I produce them.

Int. 85. Have you a duplicate constructed in accordance with said original second membrane telephone? If so, please produce it. Ans. I have, and I now produce it.

"Int. 86. Please look at the wooden ring and membrane now shown you, and state wherein it resembles or differs from the wooden ring and membrane now on said duplicate second instrument. Ans. It differs from it in the membrane being made of sheepskin instead of goldbeater's skin.

"Int. 87. Did your second instrument have the armature hinged to the uncovered leg of the magnet like said duplicate, or did it have it attached with a leather hinge, as described in your seventy-fourth answer? Ans. I am not sure but my impression is that it was hinged with a leather hinge.

"Int. 88. What were the membranes made of in your original telephones of June and July, 1875? Ans. Of goldbeater's skin used in single and sometimes double thicknesses."

Further details of Mr. Bell's experimental work during this period were given upon his cross-examination in 1883, as follows (C. Vol. II, page 1582, *et seq*):

"Ans. 298. The following figures show the construction of the first membrane telephone constructed, with some of the improvements that had been made on the instrument prior, I think, to the construction of the second instrument." (Here follow figures and description of the same.) "In this instrument, as originally constructed, the armature A consisted of a thick piece of soft iron. If my recollection is correct, the end of the armature was at first glued or cemented to a cork which was fastened in a similar way to the center of the membrane M.

"The powerful attraction of the electro-magnet C would cause the armature to be detached from the membrane, and it was this fact that led to improvements in the methods of attachment. One of these improvements consisted in attaching the cork to the membrane by a screw which passed up through the membrane, causing the latter to be clamped tightly between the cork and a metal washer. This is shown in the figure I am describing. Another improvement consisted in the substitution of a little metal pillar for the cork. This is shown in the drawing that I shall describe further on. These improvements, however, did not meet the difficulties of the case. When the instrument had been so arranged that the armature could not be detached from the membrane, then the attraction of the electro-magnet caused the rupture of the membrane. This led to the employment of thicker membranes and thinner armatures. In the above drawings the armature A consisted of a piece of steel spring, pivoted at one end to the pole E, and attached at the other to the membrane M.

"I have already stated that the armature was first attached to the electro-magnet by means of a pivot. Subsequently, the uncovered leg E of the electro-magnet was filed to a sort of knife edge, and the end of the armature A was attached to it by means of a leather hinge, as shown in the drawing of the second instrument which will be described further on. The operator spoke into the tube T and listened at it when receiving. I can not say that we spoke and listened exclusively at the end of the tube T. My recollection is, that we spoke to the instrument and listened to it, holding it in various positions in relation to the mouth and ear."

"Cross-Q. 304. You have stated that after the membrane had been torn by the action of the electro-magnet, a thicker membrane was adopted; please state the materials of the different membranes to which you refer, and give us as definite an idea as you can of their actual and relative thickness? Ans. The first membrane was made of gold-beaters' skin as usually found in the market. This proved insufficient for the strain put upon it by the magnet, and we adopted the plan of using more than one layer of gold-beaters' skin. I believe we also employed membranes of other materials, but I can only give my general recollection, and can not say positively at the present moment that this was the case. I had made numerous experiments with phonautographs, constructed by myself, in which the membrane employed consisted of bladder, and it is my impression that some of our membranes were constructed of this material. I can not give any definite idea of the actual thickness of the membranes. We simply tried to make them sufficiently stout and tense to stand the pull of the electro-magnet.

"Cross-Q. 305. By "we," I suppose you mean yourself and Mr. Watson; do you not. Ans. Yes.

"Cross-Q. 309. If I understand you correctly, the cork connection from the armature to the diaphragm was not used after you employed the metal pillars which are shown attached to these armatures; am I not right? Ans. I do not know, my impression is that it was frequently used.

"Cross-Q. 314. In your letter to Mr. Hubbard of July 1, 1875 (page 143 of complainant's printed record), you refer to an experiment made that afternoon; the transmitting instrument used in that experiment was one of the two machines about which you have been testifying; was it not? Ans. Yes, it was the first one.

"Cross-Q. 315. Do you remember the condition of that machine at the time of that experiment—whether it was before the improvements had been made, or whether any, and if so, which of the improvements had been applied to it, and was used on it at that time? Ans. I do not remember. My recollection of the experiment is derived simply from the letter.

"Cross-Q. 316. I see no indication in the letter that in that experiment of July 1st there was any trouble from the rupture of the membrane or detachment of the armature therefrom, and hence I judge that you had already before that date gotten over those two difficulties; what is your recollection or opinion about that? Ans. My impression agrees with that, although no mention of a battery as having been used is made, so that the membrane would not have been likely to be ruptured. My impression that the improvements to obviate this had already been made, is based upon the fact that I gave orders for the construction of the instrument on the second of June, whereas this experiment did not take place until the first of July. I was so anxious to try the experiment, that it must certainly have been made at the earliest possible moment the instrument could have been used. It is possible, however, nay, probable, from the first line of the letter of July first, that the experiment had been previously tried with indifferent or doubtful results. My opinion is that experiments had been tried and modifications made before the date of this letter, but I can not be absolutely certain about it."

Mr. Bell's untiring efforts and the experiments and the resulting improvements made during the month of June, 1875, culminated in the encouraging experiment of July first, as related in the letter of that date to Mr. Hubbard, substantially to the following effect:

The experiment promised to be a grand success. With a stretched membrane attached to the armature of an electro-magnet, as a transmitter, and placed in circuit with an ordinary harmonic reed receiver, the varying pitch of the voice was plainly perceptible, but not the quality. With another membrane instrument provided for a receiver it was possible, nay, probable, that the *timbre* or quality of the sound could be perceived, and he hoped to try the experiment the very next day.

XIV.

The second instrument provided with a membrane and an attached armature was completed a day or two afterward, and the duplicate instruments were arranged together upon the circuit.

We have now to ascertain, to the best of our ability and from the complainant's record, the facts regarding the results actually obtained by Mr. Bell in the various trials and experiments made with these instruments.

The first statement made by Mr. Bell upon this subject, contained in the record, is found in his celebrated "London Lecture," delivered before the Society of Telegraph Engineers at London, England, October 31, 1877, as follows (C. Vol. IV, Exhibits, page, 899):

"I immediately proceeded to put my new idea to the test of practical experiment, and for this purpose I attached the reed A (Fig. 23) loosely by one extremity to the uncovered pole *h*, of the magnet and fastened the other extremity to the center of a stretched membrane of gold beaters' skin *n*.

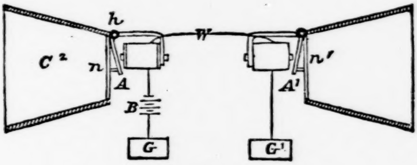


FIG. 23.

"I presumed that upon speaking in the neighborhood of the membrane *n*, it would be thrown into vibration and cause the steel reed A to move in a similar manner, occasioning undulations in the electrical current that would correspond to the changes in the density of the air during the production of the souud; and I further thought that the change of the intensity of the current at the receiving end, would cause the magnet there to attract the reed A¹ in such a manner, that it should copy the motion of the reed A, in which case its movements would occasion a sound from the membrane n^1, similar in *timbre* to that which had occasioned the original vibration.

"The results, however, were unsatisfactory, and discouraging. My friend, Mr. Thomas A. Watson, who assisted me in this first experiment, declared that he heard a faint sound proceed from the telephone at his end of the circuit, but I was unable to verify his assertion.

"After many experiments attended by the same only partially successful, results I determined to reduce the size and weight of the spring as much as possible. For this purpose I glued a piece of clock spring, about the size and shape of my thumb nail, firmly to the center of the diaphragm, and had a similar instrument at the other end (fig. 24); we were then enabled to obtain distinctly audible effects."

Mr. Bell has fixed the time when this last construction was made, as follows (C. Vol. 1, page 173):

"Int. 180. When did you first construct a membrane telephone with a piece of clock spring, about the size and shape of your thumbnail, glued to the center of the diaphragm? Ans. Shortly after the granting of my patent of March 7, 1876; I think within the month of March."

The latest statement in the record made by Mr. Bell relating to this matter, was given by him upon the occasion of his renewed cross-examination in 1883, as follows (C. Vol. 2, page 1574):

"Cross-Q. 281. When did you first succeed in getting your electric-speaking telephone to transmit vocal speech so that it was heard and understood from the receiver? Ans. Somewhere about June or July, 1875. The articulation of the instrument was not entirely intelligible at this time, but I feel perfectly sure that many words were understood, although I can not recall the details of any particular experiment made at this time when the words were fully understood.

"Cross-Q. 282. Can you state the circumstances under which any experiment was made in June or July, 1875, at which any word was heard and understood through the instruments? Ans. My recollection of these experiments is very vague, but I remember distinctly that on one occasion I was speaking to a membrane telephone (of the form marked in this case as 'telephone of 1875') in the top part of Mr. Williams' factory, 109 Court street, Boston, while Mr. Thomas Watson was listening to an instrument in the workshop below. I was interrupted by the sudden appearance of Mr. Watson, who had rushed up stairs in a state of great excitement, and who declared that he had heard vocal sounds proceed from the instrument to which he had been listening, and that he could almost understand what was said. We then changed places, but I was unable to hear anything on that occasion. This inability I attributed, at the time, to the noise of the machinery in the workshop, and to the fact that Mr. Watson was unable to throw out his voice with sufficient force to set the membrane of his telephone into good vibration. I have a general recollection that numerous similar experiments were made during June and July, and that I, myself, obtained audible results. It is my impression that a few common words or sentences were occasionally understood, but I can not give the details of any particular experiment in which this was the case. I only remember that the results were such as to lead me to the firm conviction that the speaking telephone was a *fait accompli*. In consequence of this, I took out a patent for the speaking telephone without waiting to obtain better results.

"Cross-Q. 283. Am I to understand you that when your patent of March 7, 1876, issued, you had attained no better results than the results which you attained in June and July, 1875? And if that is not your meaning, please explain more fully what you mean by the last part of your last answer. Ans. That is my meaning.

"Cross-Q. 284. Did Mr. Watson assist you in all your telephone experiments in June and July, 1875? Ans. He did.

"Cross-Q. 285. In the experiment to which you referred in answer to cross-question 282, when Mr. Watson interrupted you by rushing up and announcing that he had heard vocal sounds, he also informed you that he could not make out through the instrument what you said, did he not? Ans. He did: he said 'he could almost understand what I said.'

"Cross-Q. 286. He did not state any word that he thought he had heard, did he?" Ans. I don't remember; I can not recall the experiment in any detail; I simply have the general remembrance of the excitement which he manifested, and of my disappointment at not being able to hear what he had.

"Cross-Q. 287. From his excitment I should judge that that experiment had produced better results than any prior experiment; is that your understanding? Ans. It may be so.

"Cross-Q 288. When you exchanged places with him during that experiment you were not able to understand any words through the telephone, were you? Ans. No.

"Cross-Q 289. And if I understand you correctly, you were also disappointed in not being able to personally verify Mr. Watson's statement as to the result obtained. Am I not correct? Ans. Yes; in regard to that experiment.

"Cross-Q 290. Do you remember any other experiment which you made between that time and the issue of your patent of March 7, 1876, in operating, or attempting to operate, speaking telephones? Ans. I remember that I made a number of experiments during June and July, the details of which I have forgotten."

Here is a manifest conflict of testimony. Upon close examination, however, it will be found that, while the assertions made in his deposition produce, most decidedly, an impression wholly inconsistent with the tenor of the passage cited from his London lecture, yet all these expressions are so qualified and so shaded off as to their imputed reliability that not a single statement of fact, in conflict with the explicit statements made by Mr. Bell in his London lecture is made positively and without the mention of circumstances which tend to detract from its reliability.

The statement that he first succeeded in getting his apparatus to transmit vocal speech so that it was heard and understood "somewhere about June or July, 1875," taken by itself would be absolutely irreconcilable with the tenor of his narrative at London. But the reliability of this statement is immediately weakened by Mr. Bell, in the very next sentences, by showing that it was based upon his feeling of confidence, rather than upon his actual knowledge and definite recollection. "The articulation of the instrument was not entirely intelligible at this time,'' nevertheless, "although I can not recall the details of any particular experiment made at this time when the words were fully understood," yet, "I feel perfectly sure that many words were understood."

"My recollection of these experiments is very vague," yet "I remember distinctly that on one occasion," Mr. Watson declared "that he had heard vocal sounds proceed from the instruments to which he had been listening, and that he could almost understand what was said."

"He did not state any word that he thought he had heard, did he? I don't remember; I can not recall the experiment in any detail; I simply have the general remembrance of the excitement which he manifested, and of my disappointment at not being able to hear what he had." And "he also informed you that he could not make out through the instrument what you said, did he not?" "He did; he said 'he could almost understand what I said.'" "I have a general recollection that numerous similar experiments were made during June and July, and that I, myself obtained audible results." "I remember that I made a number of experiments during June and July, the details of which I have forgotten." "It is my impression that a few common words or sentences were occasionally understood, but I can not give the details of any particular experiment in which this was the case." "I *can only remember* that the results were such as to lead me to the firm conviction that the speaking telephone was a *fait accompli*."

Under ordinary circumstances, were it absolutely necessary, one would find it not impossible in weighing together two such contradictory statements, to form for himself a reasonably certain conclusion as to the actual fact. This could be done by giving due and proper weight, on the one hand, to a class of assertions made eight years after the event and confessedly based upon vague recollections, general remembrances and mere impressions, and upon the other hand, to positive unqualified statements, made in public, in an address delivered before a body of eminent scientific men, and at a time when the events were fresh in mind, and when, owing to the intense public interest in the subject, every detail in the history of the development of the invention was eagerly welcomed.

But, fortunately, we are relieved from the necessity of even considering the question in this phase of its presentation, for we find upon examination that Mr. Bell has from time to time placed himself upon record in a manner so unequivocal and has made such positive statements of the facts involved, that there would seem to be no room left for discussion.

The year following the delivery of his London lecture Mr. Bell wrote his "Preliminary Statement in Speaking Telephone Interferences," sworn to November 20, 1878, in which he again recited the history of the development of his invention. The facts, were then stated by him as follows (C. Vol. IV Exhibits, page 1009):

"Another instrument with stretched membrane was immediately constructed and the experiment spoken of in said letter (of July 1st to Mr. Hubbard already quoted) was tried, of transmitting speech. One instrument was placed in my experimental room at the top of the building and the other in the workshop below. I spoke from my room to Mr. Watson and he spoke to me from below. I heard nothing, but Mr. Watson soon rushed upstairs and said he could hear my voice but could not make out what I said. We then changed places, but with the same result; he heard my voice but I could not hear his. I am unable to say whether we used the instruments with a battery or without, as on the previous occasion referred to in the letter to Mr. Hubbard. I am free to say that the results were not as good as I expected, but I believed that the failure to obtain better results was due to the imperfect construction of the instruments, or to their parts not being properly proportioned. I fully believed that the elements combined in that apparatus were capable of giving better results than I attained in these experiments, and that the instruments embodied an important and valuable invention. I saw clearly that a current was induced different from that which attended the use of any other apparatus with which I am acquainted, and which was characterized, not by makes or breaks of regular or irregular intervals or even by waves or impulses of equal strength or duration, but by impulses which corresponded to the vibration of the air which moved the membrane. I had combined elements which had never before been combined, and had produced entirely new results.

"A few weeks after this I was obliged to go to Canada, and I was therefore compelled temporarily to suspend my labors upon these inventions."

The next year, in 1879, Mr. Bell gave his deposition in the *Dowd* case, and at the close of his cross-examination his attention was directed to the foregoing passage, but without eliciting, either then or upon the re-direct examination, any assertion in qualification of the definite statements of fact made in the passage cited. (C. Vol. I, page 197.)

"Cross-Int. 258. Does your preliminary statement in the Speaking Telephone Interference, sworn to Nov. 20, 1878, contain the following: 'Another instrument with stretched membrane was immediately constructed, and the experiment spoken of in said letter was tried, of transmitting speech. One instrument was placed in my experimental room at the top of the building, and the other in the workshop below. I spoke from my room to Mr. Watson, and he spoke to me from below. I heard nothing, but Mr. Watson soon rushed upstairs, and said he could hear my voice but could not make out what I said. We then changed places, but with the same results. He heard my voice, but I could not hear his?' Ans. It does."

"Cross-Int. 259. The apparatus used in the experiment described in this quotation was the apparatus described in your patent of 1876, on which this suit is brought, and delineated in Fig. 7 of the drawings, was it not? Ans. It was substantially similar.

"Cross-Int. 260. Do you remember any difference between that apparatus used in that experiment and the apparatus described and shown in the patent? Ans. I do. The transmitting and receiving cones shown in the patent were not employed. The armatures used in the experiment referred to were hinged to the uncovered leg of the magnet by a strip of leather. The coils used in the experiment were not specially adapted for use upon a line. I am not sure also whether any battery was used in the experiment.

"Cross-Int. 261. Do you remember anything more in regard to the construction of that experimental instrument, either as to what it did contain and the patent does not, or to what it did not contain and the patent does? Ans. The experimental instrument had an arrangement for straining the membrane and a frame-work for holding the magnet, which are not shown in the patent."

On the direct examination at that time Mr. Bell's attention was also particularly directed to the passage already cited from his London lecture, when he further testified as follows (*Ibid.* page 172):

Int. 174. I call your attention to your London lecture, delivered before the society of telegraph engineers, extracts from which have been put in evidence for the defendant; please state the circumstances under which you delivered that lecture? Ans. I was invited to deliver a lecture before the society of telegraph engineers for the purpose of showing the various steps that had resulted in a speaking telephone. I accepted the invitation and a special general meeting of the society was called. I delivered the lecture on the 31st of October, 1877, without notes, giving the various stages as well as I could from memory, as I had no memoranda with me to which to refer.

"Int. 175. I call your attention to the extract on page 407 of that lecture, which the defendant has put in on page 183 of the record. State what experiment it was that you had in mind and which you there referred to in the following sentence: 'My friend, Mr. Thomas A. Watson, who assisted me in this experiment, declared that he heard a faint sound proceed from the telephone at his end of the circuit, but I was unable to verify his assertion.' Ans. I gave my recollection of the result of the first experiment made with the membrane telephone referred to in my seventy-fourth answer. (previously cited, *ante* page —.)

"Int. 176. At the time you gave you London lecture, what was your recollection as to the receiver used at that time, and as to whether your two first membrane telephones were made at the same time or at different times? Ans. It was my recollection that immediately upon performing the experiment illustrated by Fig. 22 and described in my seventy-first answer, (*ante* page .) I gave my instructions to Mr. Watson to have two membrane telephones constructed: that they were constructed within a few days, and tried, with the results noted in the passage quoted in the preceding question. My impression at the time of my lecture was that my first two membrane telephones were constructed at the same time, and that one of them was used as a receiver in my first experiment.

"Int. 177. State whether you did or did not, before the issue of your patent of March 7, 1876, construct or use any membrane speaking telephones other than the two of which

Exhibits 19, 22 [original Nos. 31, 34] (see your seventy-sixth and eighty-seventh answers) are duplicates? Ans. I did not.

"Int. 178. What did you mean by the following passage from page 407 of your London lecture. 'The results, however, were unsatisfactory and discouraging?' Ans. I expected so much that I was naturally disappointed to be unable myself to hear the results I had anticipated.

"Int. 179. Were you or were you not discouraged by these discouraging results? Ans. I was not. I wavered in a full and firm belief that I had solved the problem of the transmission of articulate speech electrically, and that the apparatus we had constructed could be used for that purpose.

"Int. 180. When did you first construct a membrane telephone with a piece of clock spring about the size and shape of your thumb nail, glued to the centre of the diaphram? Ans. Shortly after the granting of my patent of March 7, 1876; I think within the month of March."

While Mr. Bell would apparently have the sentence: "My friend, Mr. Thomas A. Watson, who assisted me in this first experiment, declared that he heard a faint sound proceed from the telephone at his end of the circuit, but I was unable to verify his assertion," now understood as having been uttered with reference to the first experiment made with a single membrane instrument combined with a harmonic receiver, it is noticable that he makes no qualification whatever, either as regards the statement of fact contained in that sentence, or of the succeeding expression: "After many experiments attended by the same only partially successful results, etc." While in his last quoted answer Mr. Bell fixes beyond question the date of the construction of the instruments referred to in the immediate context, and concerning which Mr. Bell had stated, "We were then enabled to obtain distinctly audible effects," as being subsequent to the granting of his patent of March 7, 1876.

This was re-affirmed by Mr. Bell, and without qualification, when his attention was again directed to the subject in 1883. (C. Vol. 2, page 1650. *Cross-Q.* 472.)

But upon his examination in the *Dowd* case in 1879, Mr.

Bell was asked to make independently another statement of the facts, when he testified very briefly as follows (*Ibid.* page 145):

"Int. 90. Did you try these two telephones in July, 1875, one as transmitter and one as receiver; and if so, where and with what results? A. I did. One of the instruments was placed in the room at the top of Mr. Williams' building, and the other in the workshop below. I spoke to one of the instruments while Mr. Watson listened at the other, and *vice versa.* I do not remember with any great distinctness the details of the experiment, but I have a distinct recollection that during the course of the experiments Mr. Watson rushed up to the room at the top of the building where I was and informed me that he could distinctly hear me speaking, although he could not quite make out what I said. He had satisfied himself that the sounds he had heard, had been produced by the membrance telephone to which he had been listening.

"Int. 91. Was Mr. Williams' work-shop a quiet place or a noisy place at the time that you tried these experiments? Ans. A very noisy place."

Upon comparing together these additional statements, which all tell one and the same story, we are compelled to believe that story, that it was the whole story, and that if Mr. Bell could have truthfully made it stronger, when the events were comparatively fresh in mind and when there was every inducement to do so, he would have done it. Under the circumstances of each case, the demand was made upon him to detail explicitly the actual results attained with these instruments and without reservation or qualification except that in the last case cited the demand was limited to the results obtained in July, 1875. Even this limitation was immaterial, since he has expressly stated in answer to Cross-Q. 283 (already quoted) that when his patent of March 7, 1876, issued, he had attained no better results than the results he had attained in June and July, 1875.

We are therefore forced to the conclusion by the weight of Mr. Bell's own testimony, that with these instruments Mr. Bell, in fact, "heard nothing," and that Mr. Watson

" heard a faint sound " from Mr. Bell's " voice," but " could not make out what was said; " in a word, that Mr. Bell was unable to hear a sound from these instruments, while Mr. Watson, hearing a sound, was unable to distinguish a word; and that it was only from a construction made subsequently to the granting of the patent, that they were " enabled to obtain distinctly audible effects."

XV.

But we are not compelled to rest our conviction of the truth upon Mr. Bell's statements alone. It is confirmed by the statements of every witness in the record, whose testimony bears upon the subject.

Mr. Watson, who was Mr. Bell's assistant during all these experiments, testified in his direct examination in the *Dowd* case as follows (C. Vol. I, page 203):

"Int. 11. Please look at the permanent magnet now shown you, and which is the one produced by Mr. Bell in answer to Int. 73. State whether it is or is not the permanent magnet referred to in your last answer, and whether it is or is not in the same condition it was in when you so used it? Ans. It is the identical magnet then used, but has since been mounted on a standard and painted.

"Int. 12. When did Mr. Bell direct you to make the first membrane telephone you ever saw, and when did you make it? Ans. June 2, 1875; the same day that the experiment noted in my ninth anwer took place, and immediately after it. I think I completed the instrument the next day, but certainly within three days.

"Int. 13. Describe the first experiment you tried with it. Ans. We had a line running from the attic of Mr. Williams' factory to the third story. In the attic we connected to this line the membrane telephone. In the third story we connected a harmonic receiver. I shouted into the membrane telephone. Mr. Bell listened at the receiver. I think he heard nothing. We changed places. He shouted at the telephone and I listened at the receiver. I could hear a faint sound. We were not able to use the instrument but a very short time, as the membrane got torn. I do not remember whether there was a battery in circuit or not but I think we tried it both with and without.

"Int. 14. Did you afterwards make a second membrane instrument, and if so, when? Ans. I did; some time during the following month or six weeks.

"Int. 15. Do you remember trying two membrane telephones, using one instrument as a transmitter, and the other as a receiver? If so state where such experiment was made and the results obtained in it. Ans. I do; the experiment was made on the line described in my thirteenth answer. I think the results were a slight improvement on what we had previously obtained. My recollection of this experiment is confused with that which preceded it, extending through the month of June, 1875."

Mr. Watson was re-called August 28, 1882, when he further testified as follows (*Ibid.*, page 309):

"Int. 120. If you have any memorandum of articulate speech transmitted by you and Mr. Bell with a liquid transmitter in March, 1876, will you please read it? Ans. I have such memorandum from a note book I was using at that time. It reads as follows:

March 10, 1876.

"'Mr. Watson come here; I want you. How do you do? God save the Queen!' and several other articulate sounds.

"Int. 121. When you heard that at the receiver, who was speaking into the transmitter? Ans. Mr. Bell.

"Int. 122. Where was the experiment? Ans. Between two rooms at Mr. Bell's laboratory, No. 5 Exeter Place.

"Int. 123. What liquid, if you remember, was used? Ans. Water, with a little sulphuric acid in it.

"Int. 124. Of what material, if you remember, was the wire which was attached to the membrane and dipped into the liquid? Ans. Platinum."

Upon his cross-examination he then gave the following testimony (*Ibid.*, page 311):

"Cross-Int. 134. In that experiment of March 10, 1876, did you make the memorandum in your memorandum book at the time of your experiment? Ans. I did; either the same evening or the next morning.

"Cross-Int. 135. Did you make memorandum of all the words that were spoken into the transmitter, or only of such as were heard at the receiver? Ans. Only such as I heard.

"Cross-Int. 136. I suppose a great deal was spoken into the transmitter which you could not hear at the receiver, was there not? Ans. I have no positive recollection as to how much I heard, or as to how much was said. I know, however, that the result of the experiment created great enthusiasm in my mind."

"Cross-Int. 142. In your answer to Cross-Int. 136, you say that the result of that experiment created great enthusiasm in your mind; why was your mind so greatly excited over that? Ans. Because the results were so much of an improvement on what I had previously heard in the telephone line.

"Cross-Int. 143. Was that the first time that you had heard speech successfully transmitted over a telephone line? A. I had heard the previous summer the sound of Mr. Bell's voice through the telephone, but not nearly so well as on the March 10, 1876, experiment.

"Cross-Int. 144. Prior to March 10, 1876, had you ever heard and understood any spoken words through a telephone—I mean through any electric telephone? A. I have no recollection of having heard more than the sound of Mr. Bell's voice prior to that experiment, but I can not positively assert that such was the case.

"Cross-Int. 145. In brief you have no recollection of ever having heard a word through any electric telephone prior to March 10, 1876; is not that the fact? A. The only recollection of experiments on speaking telephones prior to March 10, 1876, that I have, is that conveyed in my answers to Ints. 13 and 15, p. 203 in this case.

"Cross-Int. 146. By referring to said thirteenth and fifteenth answers, I find that they do not definitely answer the question which I have just asked. I therefore repeat the question, and call for a definite answer to it. Ans. *I have no recollection of having understood anything that was said through the telephone prior to March 10, 1876.*"

"Cross-Int. 224. When was the first time that you ever heard and understood words transmitted over a telephone line by means of a magneto-transmitter? Ans. My recollection now is that I heard and understood words from a magneto-transmitter shortly after March 10, 1876.

"Cross-Int. 225. Is that magneto-transmitter illustrated here in any of the cuts in evidence in this case? Ans. I do not remember precisely what it was, but it was similar to Exhibits 26 or 27.

"Cross-Int. 226. To the best of your recollection, how long after March 10, 1876, was it that you first heard spoken works successfully transmitted over that magneto instrument? Ans. To the best of my recollection during March or April, 1876.

"Cross-Int. 227. That instrument had a membrane diaphragm, I suppose, had it not? Ans. I think it had.

"Cross-Int. 228. Describe the armature, its size, shape, material and manner of attachment to the diaphragm in that instrument. Ans. All that I can remember about it is that it consisted of a piece of clock spring shellacked to the membrane. I do not remember the dimensions at all.

"Cross-Int. 229. Was that the first magneto instrument which had a metal armature attached to and supported only by the diaphragm? Ans. It was the first I remember.

"Cross-Int. 230. Who made that instrument, and when? Ans. I think I did just before it was tested.

"Cross-Int. 231. It was made after March 10, 1876, was it not? Ans. According to my recollection."

These reluctant admissions, fairly forced from the witness, impress one with a profound sense of their truth, and serve but to deepen the conviction at which we have already arrived.

The only other witness who has testified upon the subject is Mr. Gardiner G. Hubbard. His testimony was given in the Dowd case in 1879, as follows (Drawbaugh IV Exhibits, page 957):

"Int. 10. All the letters dated at Salem, refer to certain apparatus which the writer says he was using or experimenting with at Salem or Boston. Did you see any of the apparatus referred to in each of those letters respectively, and if so, when and where, for the first time. Ans. I made an arrangement with Mr. Charles Williams, Jr., manufacturer of electrical instruments, by which he furnished machinery, and one of his workmen, Mr. Watson, to make such instruments as Mr. Bell requested. I was in the habit of going very frequently to Mr. Williams' shop to see what was going on, and believe that I there saw the various instruments, as well as many others described in these letters. I was more particular to see the things described in the letters, as they were supposed to be of the most importance, and should have noticed if there was any omission of the things described in the letters. Most of them I have a distinct recollection of. On further reflection, I think Mr. Bell may have made the first arrangement with Mr. Williams.

"Int. 11. Do you remember any apparatus or experiment made at the time of those letters, in which a sound was made on the receiving instrument, by plucking with he finger, or by any other mechanical means, a reed on he transmitting instrument? If so, state whether you saw h an exhibition more than once. Ans. I recollect distinctly what Mr. Bell calls the steel reed described in his letter of July 7, 1875, plucking it by the finger and listening to the corresponding instrument vibrating, and think he had a bellows there which he operated, but am not so confident as to the bellows.

"Int. 12. State whether or not you remember, during the period of these letters, seeing Mr. Bell have an apparatus in which the reed was attached to a membrane, and if so, how was the membrane to be moved or vibrated? Ans. I remember distinctly two instruments, to each of which a membrane was attached, and I think a reed was fastened to the membranes, but I am not certain, and that he undertook to speak to one membrane while Mr. Watson or myself was to hear at the other instrument. The instruments were so arranged that the membranes could be stretched till they were quite tight, like a small drum head. I could hear a sound, but could never distinguish any spoken words."

Discussion is unnecessary. The testimony of these witnesses has established the fact beyond controversy. But even the possibility of a reasonable doubt is effectually removed by the production in the record, of a memorandum in Mr. Bell's own handwriting, made by him December 28, 1875, containing an exact statement of the results obtained with these instruments.

Mr. Bell has testified concerning this memorandum as follows (C. Vol. 1, page 158):

"Int. 125. Please look at the paper now shown you; state who made it. Ans. I did.

"Int. 126. When and where and for what purpose? Ans. I made it at the Queen's Hotel, Toronto, on the twenty-eighth day of December, 1875, for the information of the Hon. George Brown.

"Int. 127. What occasion had you to give him information on the matters shown in that paper? Ans. I expected to conclude arrangements for having him take out our patents in England for me, and made this drawing to illustrate certain of my inventions.

"Int. 128. Is that the same Mr. George Brown spoken of in your letter to Mr. Hubbard of September 28, 1875, which was read as part of your one hundredth answer? Ans. It is.

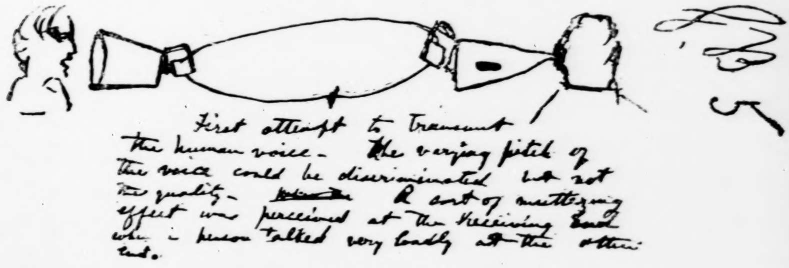
"Int. 129. State generally what inventions or what apparatus that paper shows. Ans. The invention and apparatus described in my United States patent, dated March 7, 1876.

"Int. 130. There appears to be a memorandum on the back of it not in your handwriting. Who wrote that? Ans. The Mr. George Brown referred to.

"Int. 131. In whose possession did you leave it after you made it, and when did you next see it? Ans. I left it in the possession of the Hon. George Brown in Toronto, on the twenty-ninth day of December, 1875, and I next saw it in Toronto on the 12th of November, 1878, and requested Mr. Brown to intrust it to Mr. Thomas A. Watson, who brought it on to Boston

Complainants put in evidence the paper referred to, and it is marked "Complainants Exhibit 25, Bell's Toronto Drawing, W. P. Preble, Jr., Examiner." [*Original number 37.*]

The following is a fac-simile of one of the sketches in said drawing.



First attempt to transmit the human voice. The varying pitch of the voice could be discriminated but not the quality. A sort of muttering effect was perceived at the receiving end when a person talked very loudly at the other end.

Upon his cross-examination Mr. Bell further testified regarding these sketches as follows (C., Vol. II, page 1657):

"Cross-Q. 492. Complainants' Exhibit No. 25, Bell's Toronto Drawing, printed opposite page 32 of the complainants' exhibits in this case, contains certain sketches, three in number. Under one of them are the words, 'Present form of multiple telegraph. One main battery closed circuit. Communication in both directions without induction coils. Patents not yet applied for. A. G. B.'

"Under another of them are the words, 'Discovery that led to the above form of multiple telegraph,' and under another are the words, 'First attempt to transmit the human voice. The varying pitch of the voice could be discriminated, but not the quality. A sort of muttering effect was perceived at the receiving end when a person talked very loudly at the other end.'

"In the original paper here referred to, in whose handwriting are the words that I have quoted from it? Ans. In my handwriting.

"Cross-Q. 493. If I understand your testimony correctly, that paper was made by you at Toronto, Canada, December 28, 1875, to show to Hon. George Brown, whom you were endeavoring at that time to induce to become interested with you in procuring an English patent on your invention and to furnish capital therefor; is my understanding correct? Ans. Yes; I expected him to take out other foreign patents as well as English.

"Cross-Q. 494. On that paper the sketch immediately over the words 'first attempt,' etc., bears a striking resemblance to Fig. 7, of your patent of March 7, 1876; was the sketch made as a copy of that figure, or was the figure in the patent a copy of the sketch? Or were the figure and the sketch made independently of each other to represent the same idea in your mind? Ans. Both this sketch and Fig. 7 of the patent were intended to illustrate the form of speaking telephone at which I had then arrived."

The explanatory passage accompanying the sketch which Mr. Bell declares was "intended to illustrate the form of speaking telephone at which I had then arrived" and written by him at Toronto, December 28, 1875, to be shown to Mr. Brown in explanation of the very matter in which he was then endeavoring to induce him to become personally interested, must be regarded as a *bona fide* statement by Mr. Bell, in the strongest permissible language of the actual results that had then been achieved in this first attempt to transmit the human voice.

These results were summed up in the explicit statement that, "*The varying pitch of the voice could be discriminated, but not the quality. A sort of muttering effect was perceived at the receiving end when a person talked very loudly at the other end.*"

The evidence upon this point is so absolutely overwhelming that even complainants' able counsel, appreciating its force, was compelled to admit in his recent argument in the telephone case, at New Orleans, before the United States Circuit Court, for the Eastern District of Louisiana, that the results got from these instruments did not, in fact, amount to the intelligible transmission of articulate words. Although, in justice to the counsel, it should be stated that this admission was very shrewdly coupled with an assertion, by way of avoidance, that certain conclusions were drawn by Mr. Bell at the time, "nevertheless," and notwithstanding, the existence of the facts as admitted. The entire passage from the printed argument is as follows:

> "Mr. Bell's letters of 1875 show, that he was striving to devise some variation in his instruments which should enable them more effectively to carry out his plans, when, in the course of an experiment on another subject, he accidentally discovered that what he had supposed to be a serious objection had no real basis. He instantly caused to be made a membrane telephone, and subsequently tried that and another together and got results, but which, it is claimed, and probably truthfully, did not amount to the intelligible transmission of articulate words. Nevertheless, he was satisfied that it was a mere question of good mechanical construction of instruments, and that he had made the invention." ("*Argument of J. J. Storrow, for Complainants,*" page 36.)

Every circumstance in the case is consistent with the conclusions to which we have been driven.

Thus, for example, Mr. Gardiner G. Hubbard had previously made an arrangement with Mr. Bell under which he was to write to him from time to time regarding the progress made in the development of his inventions, that the letters might be preserved as evidence, if required, in case of litigation. The arrangement was narrated by Mr. Hubbard in his deposition as follows (C. Vol. IV Exhibits, page 956):

> "Ans. 7. Mr. Bell, at my request, was in the habit from time to time of writing letters to me recording the progress that he made, that I might have the knowledge of what he was doing, and evidence to be used if it should be required, as I believed his inventions would be of very great pecuniary value, and therefore probably litigated, and by reference to these letters I have refreshed my recollection of these subjects."

No letter has been produced giving the slightest detail regarding the results attained with the two membrane instruments, although Mr. Bell stated in his letter of July 1st, that he hoped to try them together the very next day. While, on the other hand, the expressions contained in his letter of August 14th, which will be hereafter quoted, breathe a hope that, "the future will discover means of utilizing currents obtained in this way," and the belief that, "*when* we can create a pulsatory action of the current which is the *exact equivalent* of the aerial impulses, we shall certainly obtain exactly similar results," while the shrewd suggestion is made regarding the magneto-electric current that," In its present undeveloped state, it might be unwise to let Gray know anything about it, unless, indeed, we could secure the *principle* of it in a patent."

The most creditable explanation of this remarkable silence is that "the results were unsatisfactory and discouraging," and that any letters detailing them were better left unwritten.

Again, Mr. Bell produced (C. Vol. 1, pp. 152–4) rough drafts of some of the claims he originally drew in October, 1875, in preparing the specification for his patent of March 7, 1876. Among them were the following:

"3. The phono-telegraph, whereby two or more vocal or other sounds, differing in pitch, loudness and *timbre*, can be transmitted singly or simultaneously along a single wire, by causing electrical undulations upon the wire, similar in *form* to the aerial vibrations accompanying said vocal or other sounds."

"6. The method of and apparatus for transmitting simultaneously sounds differing in '*timbre*' as well as in pitch and loudness."

"3. The phono-telegraph, whereby the exact pitch, loudness and *timbre* of vocal or other sounds can be transmitted telegraphically, by causing the body by whose motion undulations are induced upon the line wire to copy exactly the aerial vibrations accompanying said vocal or other sounds, and hence to induce upon the line wire electrical undulations similar in *form* to those occurring in the air."

These were expressions directly in accordance with his *theory* of the operation of the magneto-electric current; but in the final draft of his specification, all reference to the transmission of the *timbre* of a sound was omitted. Had he actually succeeded in transmitting the *timbre* or quality of a sound (which is the essential characteristic of articulate speech) it is inconceivable that he should have omitted all reference to this crowning excellence in both specification and claim.

Other circumstances might be mentioned, such as the cessation for months of all experimental labor, the discharge of Mr. Watson, etc., which indicated a "discouraging" rather than inspiriting state of affairs, but we must be content with the citation of an additional bit of testimony given by Mr. Watson in the *Dowd* case (C. Vol. 1, page 205):

"Int. 24. Have you tried to transmit articulate speech with the instruments, Exhibits 19, 20, 21, 22, and 23? If so, state when, where and how, and with what results. A. I have. On Saturday July 5, 1879, I tried the membrane telephones Exhibits 19 and 22 on a line between two parts of the building, 40 State street, with the circuit arranged as in Mr. Cross' third answer, using the sheep skin diaphragms Exhibits 20 and 23, and the heavy armatures Exhibit 21 and another one like it, which I now produce. I carried on conversation with Prof. Bell successfully, using three cells bichromate battery, the same that Mr. Cross described.

"On Monday, July 7th, I placed the instruments in circuit between the attic and third story of Mr. Williams' manufactory, under almost precisely the same conditions as the experiment of June 2, 1875. I could hear occasionally very faint sounds. The battery used was two large bichromate cells. We then carried the instruments to 40 State street, and tested them again on the same circuit as on the 5th with as good results as obtained that day."

"Int. 25. Please state how the results which you obtained in the trials just mentioned compare with the results obtained in the trials of June and July, 1875. If there is any difference, state what, in your opinion, is the cause of it? Ans. In the experiment of July 7, 1879, at Mr. Williams' workshop, I do not think the results were any better, if as good, as those obtained in June or July, 1875, but the results obtained at 40 State street, on July 5, 7 and 9, 1879, were decidedly better. The reason why the results were better at 40 State street is, in my opinion, due to the fact that we were in a very quiet place, and that we were more practiced in listening for faint sounds than in 1875."

It thus appears that in 1879, at the trial of certain instruments in a particular location, Mr. Watson "could hear occasionally very faint sounds," and this performance is made by him a standard of comparison, by which he is enabled, incidentally, to inform us as to the effects actually observed by him in June and July, 1879.

He says with charming ingenuousness, "I do not think the results were any better, if as good, as those obtained in June or July, 1875."

But these results were simply hearing, not words, but *occasionally very faint sounds.*

The mind is inevitably led, under the circumstances, to the natural conclusion that in making this comparison no *marked* difference in the results was perceptible to Mr. Watson, and that the effects perceived were, in fact, substantially similar in the two cases.

XVI.

We are now called upon to meet the very problem that was then presented to Mr. Bell.

He had ceased all further experimental work, as shown by his testimony. (C. Vol. 2, page 1581.)

Cross-Q. 297. You state in your last answer that 'few, if any, experiments of any kind were made between the end of July and the date of the patent.' I judge from that statement that you can not remember of any experiments having been made between the end of July and the date of the patent; am I correct? *Ans.* Yes."

The great excitement he had undergone, the intense thought and the severe application given to his work, together with the alternations of hope and disappointment had made him sick, and Mr. Watson as well:

"Then came the experiments of June 2, 1875. This was followed by a period of great excitement over the speaking telephone—a period of constant experiment and sleepless nights. During this period my mind was also much worried by domestic matters and by pecuniary distress; and all these things combined led to a complete breakdown of my health about the end of July or the commencement of August." (C. Vol. 2, page 1663. Ans. 521.)

"About the end of July, the experiments were suspended on account of the illness of Mr. Watson, and when he had recovered I was in no condition to resume work. By about the commencement of August my health had completely broken down, and during that month I hardly left Salem, excepting for an occasional visit to Mr. Hubbard's house in Cambridge. I made no experiments during this month, but occupied my time in thinking and pondering over the experiments that had been made in the preceding months. About the end of August or the first of September I left Salem for my father's house in Canada."

In thus thinking and pondering over the subject, the question naturally arose: What could he do under the circumstances to profit by the occasion?

To justly apprehend the situation, let us glance over the past, in the briefest possible *resume*, of the history down to this point.

Mr. Bell's attention had been directed at an early date to the great problem of the electrical transmission of speech.

In November, 1873, by the study of an article upon "The Acoustic Telegraph" he had acquired a knowledge of what had been accomplished by his predecessors in this direction and of the underlying and fundamental principle through the application of which the solution was to be sought. This was, that sound was to be reproduced at a distance in a receiver by electrically reproducing in that receiver the identical vibrations imposed by the original sound upon the transmitter. In 1874 he was led to the clear apprehension that the making and breaking of the circuit, effected by the transmitters previously employed, was only the first step toward the practical development of that great principle, inasmuch as its power was limited to the production of vibrations in the receiver which corresponded only in rate of succession to the vibrations in the transmitter, thus reproducing a sound in the single quality of pitch alone.

He then formed the brilliant conception that by effecting an arrangement of the armature in the transmitter, so that it should vibrate in front of its electro-magnet in exact correspondence with the air vibrations produced by a sound, these vibrations would, by their movement, induce upon the circuit the flowing of a vibratory current, which would correspond in its oscillations exactly to the vibrations of the armature, and consequently to the aerial impulses produced by the sound.

The rate of the oscillations in this current would correspond to the rate of the vibration of the armature, and consequently to the pitch of the sound; the intensity of each electrical impulse would vary directly with the amplitude of the vibration of the armature,* so that it must likewise correspond to the loudness of the sound; while the polarity or direction of the electrical impulse would correspond exactly to the direction of the motion of the armature in its vibration, and hence to the alternate condensations and rarefactions constituting the aerial sound-wave movement.

---

* For the rate of this vibration fixes the definite time within which each single vibration is performed, and the greater the amplitude passed through during this time, the greater is the motion of the armature and the more intense the electrical impulse produced.

The "make and break" current previously employed passed, in its operation, through, only one phase of variation, to wit: variation in the rate of succession of the electrical impulses, these impulses varying neither in their intensity, nor in their polarity or direction of movement.

But on the other hand, and in severe contrast, here was a current which, by a fundamental law of electricity, *must* always correspond exactly in every phase of its charge with the variations taking place in the movement of the vibrating armature which is inducing it. Every irregularity and every intricacy of that movement, whatever be its cause or origin, *must* produce a strictly corresponding variation in the current which that very movement is at the instant in the act of generating or causing.

The clear apprehension of this fact, or law of electricity convinced Mr. Bell, *per force* that this current, thus produced, was precisely the instrumentality which would do the work, could it but be made available for the purpose.

The great PRINCIPLE which he then conceived was, the transmission of speech by the generation of this current by the vibrations of an armature corresponding exactly to the air vibrations accompanying the sound.

Could this principle be actually embodied in an apparatus which should strictly fulfill these conditions, its "mode of operation" would be such that, theoretically, *speech must be transmitted.*

There were, obviously, two practical conditions, both necessarily involved in the very conception of the possible embodiment of that principle in a working apparatus.

First. The construction and arrangement of the armature must be such that its vibrations would, in deed and in truth, be actually similar in form to the vibrations of the air accompanying the sound, as otherwise the *quality* of the sound would be lost, speech would not be reproduced, and there would be no actual embodiment of the principle in a material form.

Second. The metallic armature must be of such size, form and density that these very vibrations would induce or cause electrical impulses of sufficient power to produce audible vibrations in the receiving armature, as otherwise the apparatus would be useless for any practical purpose.

The happy accident of June 2, revealing to Mr. Bell the fact that mechanically vibrated armatures could induce electrical impulses strong enough to set a receiving armature into audible vibration, convinced him that the accomplishment of the second of the above mentioned conditions was within the range of possibility and the legitimate hope of attainment.

In regard to the fulfillment of the first condition, he says (C. Vol. IV, Exhibits page 1008):

> "My mind immediately recurred to the use of a membrane as a means of operating an armature *so as to correspond to the vibrations of the air* caused by vocal sounds, and either on the same day, or shortly after, I gave orders for the construction of two instruments in which the armature of an electro-magnet should be moved by the vibrations of a stretched membrane, to which it was connected."

The instruments were constructed, but to his disappointment they proved, as we have seen, to be an utter failure in the transmission of speech. The armature neither vibrated "so as to correspond to the vibrations of the air caused by "vocal sounds," nor produced electrical undulations "similar in form to the vibrations of the air accompanying the "said vocal or other sounds."

The *principle* had not been given an embodiment in a practical or working apparatus. The great problem of the actual transmission of speech electrically had not been solved. The world was not yet possessed of a telephone capable of transmitting, however feebly, even a single word of articulate speech.

At the very best test that he could afterwards report, the most noticable results he could mention were that he, Mr. Bell himself, heard nothing, while Mr. Watson heard a faint sound. Or, to give Mr. Bell the benefit of the most favorable statement he made to Mr. George Brown the day he procured his signature to the contract. "The varying pitch of the voice could be discriminated, but not the quality. A sort of muttering effect was perceived at the receiving end when a person talked very loudly at the other end."

This was the most that Mr. Bell and Mr. Watson had been able to accomplish after two months of the severest application, during "a period of constant experiment and sleepless nights."

His efforts exhausted, he abandoned all further attempt for the present, if that is the meaning of his discharge of Mr. Watson and his cessation from all experiments during the succeeding months, and until after his return from Washington in March, 1876, and, looking over the whole ground, he sought diligently for something that could be saved from the failure.

Thinking and pondering over the matter he finally concluded that, inasmuch as Mr. Watson had been able to hear a faint sound, of which the pitch could be discriminated, but unfortunately not the quality, the essential characteristic of speech, there were yet further possibilities in store in the future, and that the production of this magneto-electric current was simply the key to still greater things.

He was convinced that his *theory* was correct and that his *principle* was a right one; that, while he had utterly failed to embody that principle in a working apparatus which would transmit speech, although through no fault of his own, but because of the inherent difficulties involved in the practical problem, the *future* might discover means of utilizing this current in actual service through any distance and from place to place. He felt absolutely sure that, when means should be discovered, which in their operation would actually produce a pulsatory action of the current in exact equivalency of the aerial impulses, there would certainly be obtained exactly similar results.

In this full confidence, he then and there determined to forestall the future, and to patent the *principle*, so that hereafter, should any rival succeed where he had failed, he could appropriate to himself the fruits of that success, *by* *virtue of a superior right.* This was the purpose upon which he finally resolved, and which he has plainly and unmistakably *avowed* in his own testimony. (C. Vol. II, page 1674.)

"Q. 561. You say that you occupied your time in thinking and pondering over your experiments; if you had any paper written during that month of August, 1875, which expresses your state of mind and your conclusions from all that you had thought and done up to that time, upon the subject of your invention, set forth in your patent of March 7, 1876, will you please read it? Ans. On the 14th of August, 1875, I wrote to Mr. Hubbard the following letter, which is already in evidence and printed as part of my answer 94, page 147.

"SALEM, MASS., August 14, 1875.

"*Dear Mr. Hubbard:*

"On glancing back over the line of electrical experiments, I recognize that the discovery of the magneto-electric current generated by the vibration of the armature of an electro-magnet in front of one of the poles, is the most important point yet reached. I believe that it is the key to still greater things. The effects produced, though slight in themselves, appear to me so great in proportion to their cause that I feel sure that the future will discover means of utilizing currents obtained in this way on actual telegraph lines.

"So important does it seem to me to protect the idea, that I think some steps should be taken immediately toward obtaining a caveat or patent for the use of a magneto-electric current, whether obtained in the way stated above, (by the vibration of permanent magnets in front of electro-magnets,) or in any other way. I should wish to protect it specially as a means of transmitting, simultaneously, musical notes differing in *intensity* as well as in pitch.

"I can see clearly that the magneto-electric current will not only permit of the actual copying of *spoken utterance*, but of the simultaneous transmission of *any* number of musical notes (hence messages) without confusion.

"The more I think of it the more I see that the method of making and breaking contact so many times per second, is only the *first stage* in the development of the idea.

"When we create a pulsatory action of the current, which is the *exact equivalent* of the aerial impulses, we shall certainly obtain *exactly similar* results. *Any number of sounds* can travel through the same air without confusion and any number should pass along the same wire.

"It should even be possible for a number of spoken messages to traverse the same circuit simultaneously, for an attentive ear can distinguish one voice from another, although a number are speaking together.

"Don't you think it would be well to take out a *caveat* for the use of the magneto-electric current?

"In its present undeveloped state, it might be unwise to let Gray know anything about it, unless, indeed, we could secure the *principle* of it in a patent.

"Yours respectfully,
"A. GRAHAM BELL.

"GARDINER G. HUBBARD, Esq., Cambridge."

We are now met, as before stated, by the very problem which was then presented to Mr. Bell. Shall we approve his decision? Did he act wisely in thus ceasing all further effort toward the actual embodiment of his great principle in a material form, leaving the future to discover the means which might effect its utilization, and devoting his great intellectual abilities to the task of effectually patenting that principal, that he might thereby secure to himself the exclusive right to its practical working?

Or, on the other hand, should he have refrained from entering the patent office, except possibly by a caveat, until the succeeding year, when the requisite means had at last been discovered and applied, as set forth in his second patent?

Patents are authorized only for inventions, not for scientific theories, or for unembodied principles. They are granted for the actual, not the ideal; for the substance of things hoped for, not the promise. They are provided as a reward for difficulties actually overcome, not put over into the lap of the future; as a stimulus to untiring effort, not as an encouragement to ease; to promote the progress of the useful arts, not to hinder their development.

The law is stern and inflexible, guarding jealously the rights of the public against all undue encroachment.

A *monopoly*, whatever its character, is, in a sense, repugnant to the instincts of a free people, and it can only be lawfully gained by giving to the public, as a *quid pro quo*, a *useful* art, machine, manufacture or composition of matter, or a new and *useful* improvement thereof. Was Mr. Bell, as matter of fact, then in a condition to pay to the public this price for the monopoly he sought?

Had he within his possession the art of the transmission of speech by electricity?

Had he even the information how to transmit speech by electricity?

Could he tell others how to do it, when the difficulties encountered had been so great that he himself, and Mr. Watson also, had both utterly failed, notwithstanding their admirable equipment for the task?

Could he describe this new and useful art "in such full, clear, concise and exact terms" as to enable any person skilled in any art or science, or in any number of arts or sciences, to construct an apparatus which would transmit speech electrically, without the necessity of making further experiment, research of invention?

The remarkable fact is developed in his testimony that, confessedly, he did not even attempt to make any actual portrayal of his apparatus in his patent, but avoided, as far as possible, giving expression to any mechanical details of construction, a course, indeed, that was naturally to be expected, for he could not give what he did not possess, and what he did possess he had found to be defective and inadequate.

He stated in answer to Cross-Q. 392 (C. Vol. 2, p. 1620,) that:

"Figs. 5 and 6 do not pretend to show the full construction of the apparatus, but are simply electrical diagrams."

"Cross-Q. 395. Is Fig. 7 of that patent, like Figs. 5 and 6, only an electrical diagram? Ans. Certainly."

"Cross-Q. 608. (*Ibid*. p. 1696.) Please explain exactly what you mean by the expression 'electrical diagrams' which you have used several times in your testimony? Ans. A diagram that would illustrate the general electrical arrangements described in the specification, and that did not profess to be exact drawings of the apparatus, or even to show many of the mechanical details of construction."

Mr. Watson also testified as follows (C. Vol. I, page 325):

"Cross-Int. 239. The apparatus represented in Fig. 7 of Bell's first patent was not made till some time after the original instruments of which Exhibits 19 and 22 purport to be duplicates, was it? Ans. Fig. 7 I consider merely as a diagram of the original instrument made in June and July, 1875.

"Cross-Int. 240. Do you mean that prior to March 7, 1876, there was no apparatus made of which Fig. 7 would be an exact representation? Ans. I know of none.

"Cross-Int. 241. If such an apparatus was made, then I suppose you do not know why all means of adjusting the armatures relatively to the poles of the magnet were omitted from it, do you? Ans. I know of no reason why it should have been."

Turning now to the specification of the patent we find that barely four lines of that lengthy specification, and no more, are devoted to the "full, clear, concise and exact" description he then gave to the world, of the *construction* of an apparatus which would transmit speech by electricity. The passage is certainly unique in its brevity in the history of patents, and if descriptive passages ever rise to the distinction of being word pictures, this one might fairly be pronounced an "electrical diagram" in silhouette. The passage is as follows:

"The armature *c*, Figure 7, is fastened loosely by one extremity to the uncovered leg, *d*, of the electro-magnet *b*, and its other extremity is attached to the center of a stretched membrane *a*. A cone A, is used to converge sound vibrations upon the membrane."

This is all the information afforded in the patent as to the construction of the apparatus; but is this the *full*, the *clear*, the *exact* description demanded by the law?

Indeed, in the last analysis, this "electrical diagram" and the four lines explaining it, amount to nothing more nor less than a *theoretical description* of an apparatus, illustrative of the working of the *principle* set forth in the patent.

In the light of the testimony given by Mr. Bell and Mr. Watson it clearly appears that there was not even a pretense made of the representation, definitely, of the actual construction which would transmit speech.

But might not these four lines of description and the electrical diagram accompanying them enable the skilled artisan to make an apparatus which would transmit speech "from the information contained in the specification," and by the exercise of ordinary mechanical skill and without further directions or experiment?

Mr. Bell knew better.

He simply places the reader of that patent exactly where he had placed Mr. Watson on June 2, 1875, when he gave him like instructions as to how to make the instrument. Could he legitimately expect the reader to succeed any better than did Mr. Watson in like case, or than did he and Mr. Watson together, when they had passed through two months of laborious days and sleepless nights, without accomplishing the task?

Had he the confidence to believe that the practical difficulty they had *perforce* left unsolved could be solved by the reader, without experiment, and without research or invention?

Mr. Bell had turned away from a practical difficulty only to encounter a legal one even more formidable.

To secure the monopoly he desired, it was under the law essential, indeed *indispensable*, that he should describe in his specification the construction of an apparatus which would transmit speech. The difficulty was to describe such an apparatus, when he, himself, knew not how to make it, nor had yet discovered the essentials of construction which would characterize the successful as distinguished from the unsuccessful apparatus.

The two difficulties, the practical and the legal, were indissolubly united. The "new art" could only be created by overcoming the practical difficulty, while the means of overcoming that difficulty could only be "exactly" described by one who had the requisite knowledge.

The rule found no exception in this case.

It is true that the patent contains what Mr. Bell and Mr. Watson have both pronounced to be an electrical diagram, thus ascribing to it an unlimited flexibility, and also general terms descriptive of construction.

It is equally true that Mr. Bell and Mr. Watson constructed an apparatus in strict conformity with the terms of that description, and that, from time to time, they made various experimental changes in the details of the construction of that apparatus, all, however, included within those general descriptive terms, and that, nevertheless, they utterly failed to make that apparatus available for the transmission of even a single word of speech. A multitude of such forms of apparatus might be made, all in conformity with the terms of that description and with every word applicable, and yet not one of them be available for the transmission of speech, though all were made in good faith and with intent to accomplish the work.

What is the defect in the description, and wherein is it so inexact?

The answer is found in the plain fact that the patent does *not* point out the distinguishing characteristics of the construction of a successfully working apparatus, in contra-distinction from the vast array of constructions conforming literally to the terms of the general description, but wholly unavailable for the electrical transmission of speech.

This was precisely the information that Mr. Bell and Mr. Watson had so long and diligently sought and in vain, and it was this that Mr. Bell had been compelled to leave to the future to discover.

The fact that Mr. Bell, Mr. Watson and others were able to talk through alleged reproductions of the original 1875 instruments constructed "from memory and judgment," * at a later period in the history, in 1879, after these discoveries had been made, when the telephone through subsequent inventions had become a useful art, and the laws of its successful construction thoroughly understood, by no means proves that speech was transmitted through the original instruments in 1875; for the contrary is established beyond controversy. Nor does it prove that those instruments actually possessed the essential and distinguishing characteristics of a successfully working apparatus; for that would be to ascribe both to Mr. Bell and Mr. Watson a monumental stupidity if, in fact, they had instruments with which it was only necessary to speak into the transmitter that words might be heard from the receiver, and yet they passed wearisome days and sleepless nights, and made themselves both sick in the vain effort to do this very thing. Nor does it write into the patent the information there omitted, because it had not yet been discovered.

---

* C. Vol. I, page 328; Watson *Cross-Int.* 259.

The inconclusive character of all such testimony is due directly to the fact that the human mind is so constituted that memory and judgment are unconsciously and inevitably informed both by present knowledge and recent experience, and, to use an expressive bit of slang, because "hindsight is better than foresight."

Incidently, it may be remarked that Mr. Bell, in his anxiety to "secure the principle" in his patent, even withheld from the public the information he must have gained from the experience of nearly two months of daily experiment with the various parts of his apparatus, information as to the preferable size and weight of the armature, the thickness of the membrane and the proportions which would prevent the armature from being torn from the membrane, etc., leaving all these matters to be rediscovered, by renewed experiment, should any one attempt the construction of the apparatus.

In a word, Mr. Bell had certainly conceived of a great *principle* or theoretical mode of operation for the transmission of speech by electricity.

He had, as certainly, failed to embody that principle in a practical working apparatus. Certain practical difficulties had been encountered which had effectually prevented the transmission of even a single word of speech.

The principal difficulty thus encountered, was of the most serious character. It was fundamental, and its resolution was indeed integral with the solution of the problem of the practical transmission of speech.

Mr. Bell had found it impossible, as yet, to construct an armature and so combine it in an apparatus that its vibrations should actually correspond to the air vibrations accompanying a sound, or, in the language of his patent, so that it should cause "electrical undulations similar in form to the vibrations of the air accompanying the said vocal or other sounds."

But notwithstanding this acknowledged failure, Mr. Bell, nevertheless, determined to patent the *principle*, leaving to the future to discover the means for utilizing it.

But as Mr. Bell had been unable to devise means which would overcome these difficulties, so now he was unable to describe such means in his patent, and, indeed, as we have seen, he did not even make the attempt.

The issue is plainly drawn:

Could Mr. Bell, under the circumstances then existing, lawfully claim, and thereby under the law secure to himself, as his absolute right, "The method of and apparatus for transmitting vocal or other sounds telegraphically," "by causing electrical undulations similar in form to the vibrations of the air accompanying the said vocal or other sounds," whatever be the apparatus employed, provided only that it actually embodies this principle or mode of operation?

The issue is one of law to be decided under the bearing of precedents and authorities, which it is not the province of this paper to discuss.* It is an issue of surpassing import-

---

* A few citations from the authorities are given, without comment, where the statements of the law seem peculiarly apposite to the facts in this case.

At the Circuit, his Honor, Judge Shipman, in *Morton* v. *New York Eye Infirmary*, 5 Blatch. 121, stated the distinctions made by the law in clear terms, as follows:

"In its naked, ordinary sense, a discovery is not patentable A discovery of a new principle, force or law, operating, or which can be made to operate, on matter, will not entitle the discoverer to a patent. It is only where the explorer has gone beyond the mere domain of discovery and has laid hold of the new principle, force or law, and connected it with some particular medium or mechanical contrivance, by which, or through which, it acts on the material world, that he can secure the exclusive control of it under the Patent Act. He ance, and it is interesting alike to the advocate, to the court, and, in its decision, to the historian and to succeeding generations. Whatever be the decision, the peculiar significance of the facts involved, the definite issue, and the im-

---

then controls his discovery through the means by which he has brought it into practical action, or their equivalent, and only through them. It is then an invention, although it embraces a discovery. Sever the force or principle discovered from the means or mechanism through which he has brought it into the domain of invention, and it immediately falls out of that domain and eludes his grasp. It is then a naked discovery, and not an invention."

* * * * * * * * *

"Every invention may, in a certain sense, embrace more or less of discovery, for it must always include something that is new; but it by no means follows that every discovery is an invention. It may be the *soul* of an invention, but it can not be the subject of the exclusive control of the patentee, or of the patent law, until it inhabits a *body*, any more than a disembodied spirit can be subjected to the control of human laws." * * * *

"A discovery may be brilliant and useful, and not patentable. No matter through what long, solitary vigils, or by what importunate efforts the secret may have been wrung from the bosom of nature, or to what useful purposes it may be applied. Something more is necessary. The new force or principle brought to light must be embodied and set to work, and can be patented only in connection or combination with the means by which, or the medium through which it operates."

In *Burrall* v. *Jewett*, 2 Paige, 143, Chancellor Walworth enunciated the law applicable to such cases concisely, as follows: "The patent is void if the machine will not answer the purpose for which it was intended without some addition, adjustment or alteration which the mechanic who is to construct it must introduce of his own invention, and which had not been invented or discovered by the patentee at the time his patent was issued."

The rule of law has been established by this court as follows:

"The settled rule of law is, that whoever first perfects a machine is entitled to the patent, and is the real inventor, although others may have previously had the idea and made some experiments toward putting it in practice. He is the inventor and is entitled to the patent who first brought the machine to perfection, and made it capable of useful operation."

Agawam Company v. *Jordan*, 7 Wall. 602, and *Whitely* v. *Swayne*, *Id.* 687.

"Original and first inventors are entitled to the benefit of their inventions if they reduce the same to practice, and seasonably comply with the requirements of the Patent Law in procuring letters patent for the protection of their exclusive rights. Crude and imperfect experiments are not sufficient to confer a right to a patent; but, in order to constitute an invention, the party must have proceeded so far as to have reduced his idea to practice, and embodied it in some distinct form." * * * "He is the first inventor in the sense of the Patent Law, and entitled to a patent for his invention, who first perfected and adapted the same to use; and *it is well settled that until the invention is so perfected and adapted to use it is not patentable under the patent laws.*"

Seymour v. *Osborne*, 11 Wall. 552.

portance of the case will make it a landmark in the patent law for all time to come, and future inventors, under similar circumstances, will ever be guided in their course by the law which shall be established in this case.

XVII.

A second and wholly distinct issue is also involved in this case.

Granting their validity, what construction shall be given to Letters Patent No. 147,469, granted to Mr. Bell, March 7, 1876, and in particular to the fifth claim?

While this is a purely legal question, to be determined by an analysis of the terms of the patent, it yet falls within the trend of the historical development of Mr. Bell's work.

In the previous portion of this paper we have endeavored to utilize the materials afforded in complainant's record, in tracing the actual history of the development of Mr. Bell's conception of a method of, and an apparatus for, the electrical transmission of speech.

This conception found its ultimate expression in the specification of the patent.

A study, therefore, of the previous history of that conception, from its first inception to its final development into a perfect theory and a definite principle, should contribute aid toward the intelligent comprehension of that patent.

Mr. Bell has stated (C. 2, page 1674, Ans. 560):

"I made no experiments during this month (August, 1875), but occupied my time in thinking and pondering over the experiments that had been made in the preceding months. About the end of August or the first of September, I left Salem for my father's house in Canada.

Q. 561. You say you occupied your time in thinking and pondering over your experiments; if you have any paper written during that month of August, 1875, which expresses your state of mind and your conclusions from all that you had thought and done up to that time, upon the subject of the invention set forth in your patent of March 7, 1876, will you please read it? Ans. On the 14th of August, 1875, I wrote the following letter, which is already in evidence, and printed as part of my answer 94, page 147." (Here follows the letter, which has already been quoted *ante*, page)

This letter of August 14, 1875, written under the circumstances described, is a pivotal fact in the record.

After much thought and reflection, Mr. Bell, "glancing back over the line of electrical experiments," comes to a definite conclusion as to their results. He recognizes that "the discovery of the magneto-electric current generated by the vibration of an electro-magnet in front of one of the poles, is the most important point yet reached." So important did it seem to him "to protect the idea," that he declared in favor of immediately "obtaining a caveat or patent for the use of a magneto-electric current, whether obtained in the way stated above (by the vibration of permanent magnets in front of electro-magnets) or in any other way." "When we can create a pulsatory action of the current which is the *exact equivalent* of the ærial impulses, we shall certainly obtain exactly similar results." "Don't you think it would be well to take out a *caveat* for the use of the magneto-electric current? In its present undeveloped state, it might be unwise to let Gray know anything about it, unless, indeed, we could secure the *principle* of it in a patent." (The italics are Mr. Bell's.)

This letter is important, because it is introduced, avowedly as an expression by Mr. Bell of his "state of mind" at that time, and of the "conclusions" drawn by him from all that he had thought and done up to that time upon the subject set forth in the patent of March 7, 1876.

It is of even greater value as an explicit statement, made by Mr. Bell, of the purpose with which he entered upon the preparation of the specification for that patent. He would take steps immediately toward obtaining a patent "for the use of a magneto-electric current." He would secure the *principle* of it in a patent. This letter is, therefore, in the broad sense of the word, a "key" to that specification, and by its application all will be found to be opened clearly to our understanding.

Tracing the development of the specification historically, we find (C. Vol. 2, page 1676) that Mr. Bell commenced work upon it in September, 1875, during his visit to Canada.

Upon his return, about the first of October, and during that month, he occupied himself in "writing and rewriting" this specification.

It also appears that during that visit to Canada, Mr. Bell entered into negotiation with Mr. George Brown and his brother, of Toronto, with reference to their taking out foreign patents upon his inventions, in return for an interest in the same, and that a contract to this effect was concluded December 29, 1875,

In pursuance of this contract, Mr. Brown left for England about the last week in January, taking with him a copy of the specification as then prepared, which copy has since been produced in evidence. The record reads as follows (C. 2, page 1682):

"Q. 567. About when did Mr. George Brown go to England? Ans. About the last week in January, 1876.

"Q. 568. Did he take with him a specification furnished by you, corresponding to the specification of your patent of March 7, 1876? Ans. He did.

"Q. 569. Please look at the paper now shown you, and state whether it is the specification which you furnished to Mr. George Brown? Ans. It is.

"[Complainants' counsel puts a copy of the paper in evidence to be marked Complainants' Exhibit, George Brown Specification.]

"Q. 570. How long before Mr. George Brown sailed for England did you deliver this paper to him? Ans. I only know that it was handed to him between the date cf the agreement, December 29, 1875, and the time he sailed—the latter part of January, 1876.

"Q. 571. When was this paper written? Ans. In October, 1875.

"Q. 572. I observe that it is headed "United States Patent Office," from which I infer that this particular paper was originally prepared for your American specification, and not for the purpose of being handed to Mr. George Brown; what is the fact about that? Ans. Certainly; that is the fact.

"Q. 573. Did you at or about the time when you handed this paper to Mr. George Brown, also give to him descriptions of your other electrical inventions, patented and unpatented? Ans. Yes.

"Q. 574. Are these six papers, which I now show you, the ones referred to in the last question and answer? (Objected to as immaterial and irrelevant.) Ans. Yes.

"Q. 575. Will you please offer them to the defendants' counsel for his inspection, if he desires to look at them? Ans. I do so now.

"Q. 576. In the Exhibit George Brown Specification there are some alterations made by drawing the pen through words or phrases, and interlining others in place of them. What is your recollection as to when those changes were made? Ans. I have not any clear recollection of the time when these changes were made, excepting that they were made before the specification was given to Mr. Brown."

"Q. 585. You have told me this morning that you wanted to make some addition to your answer to interrogatory 571; please do so? Ans. Yes; I desire to state that though from the language used in this paper I know that it is a copy of the specification as I wrote it in October, 1875, I can not be perfectly certain that the copy was itself made in October, 1875, although it is my belief that it was. It was made as a fair copy not in my handwriting. The interlineations and corrections are in my own handwriting."

Inasmuch as the "George Brown Specification" (C. Vol. 4 Exhibits, page 936) is a copy of the original specification as it existed at one stage of its history, before it was filed in the patent office, it merits a most careful consideration, as it may aid materially toward obtaining a correct understanding of the specification as it finally appears in the patent.

It will be found, upon examination, not only to be in entire accord with the tenor of the whole previous history of the invention, but that the "key" to its understanding, given by Mr. Bell in his letter of August 14, fits the lock perfectly in every detail.

Subjecting this specification to the simplest analysis, we first find it entitled as follows:

"To all whom it may concern, be it known, that I, Alexander Graham Bell, of Salem, Massachusetts, have invented certain new and useful improvements in telegraphy, of which the following is a specification:"

This apparent limitation of the subject to "telegraphy" may however be justly and fairly ignored, in view of the much broader statement of the invention given in the body of the specification.

The substance or the essential nature of the invention is there stated as follows:

"My present invention consists in the employment of a vibratory or undulatory current of electricity in place of a merely intermittent one; and of a method of, and apparatus for, producing electrical undulations upon the line wire."

It is true, however, that "the employment of a vibratory or undulatory current of electricity" and of "a method of, and apparatus for, producing electrical undulations" is described in the specification principally in its application to purposes of multiple telegraphy, and only incidentally in its application to the purpose of the transmission of vocal and other sounds.

This incidental application, however, can not be ignored, inasmuch as the fifth claim appears by its terms to be especially based upon that application.

By way of introduction and with especial reference to the intended application of his invention to purposes of multiple telegraphy, Mr. Bell makes reference to a preceding patent as follows:

In letters patent granted to me I have described a method of, and apparatus for, transmitting two or more telegraphic signals simultaneously along a single wire by the employment of transmitting instruments, each of which occasions a succession of electrical impulses differing in rate from the others; and of receiving instruments, each tuned to a pitch at which it will be put in vibration to produce its fundamental tone by one only of the transmitting instruments; and of vibrating circuit breakers operating to convert the vibratory movement of the receiving instrument into a permanent make or break (as the case may be) of a local circuit in which is placed a Morse sounder register, or other telegraphic apparatus. I have also therein described a form of autograph telegraph based upon the action of the above mentioned instruments.

"In illustration of my method of multiple telegraphy I have shown, in the patent aforesaid, as one form of transmitting instrument, an electro-magnet, having a steel spring armature, which is kept in vibration by the action of a local battery. This armature in vibrating makes and breaks the main circuit, producing an intermittent current upon the line wire. I have found, however, that upon this plan the limit to the number of signals that can be sent simultaneously making and breaking the same circuit, the effect upon the main line is practically equivalent to one continuous current."

He then states the advantages to be derived from the use of this current for purposes of multiple telegraphy, as follows:

"The advantages I claim to derive from the use of an undulatory current in place of a merely intermittent one are:

"1. That a very much larger number of signals can be transmitted simultaneously over the same circuit.

"2. That a closed circuit and single main battery may be employed.

"3. That communication in both directions is established without the necessity of using special induction coils.

"4. And that—as the circuit is never broken—a spark arrester becomes unnecessary."

It will be hereafter observed that the terms "undulatory current" and "electrical undulations," which are the characteristic phrases employed by Mr. Bell in the concise statement of the invention given in the body of the specification appear, one or the other of them, in each of the claims.

Mr. Bell undoubtedly recognized the very great imporance, especially in opening up such a new art, of using only such terms as would be clearly understood, and of so defining them as to prevent even the possibility of mistake.

Mr. Bell has, indeed, stated his purpose in this respect in the strongest possible language:

"I wrote and rewrote the specification a number of times, and finally adopted that mode ef expression that seemed to me best to explain my invention, and the relation that one part of it bore to another. (C. Vol. 2, page 1620, Ans. 394).

"It will be understood then that in October, 1875, I was placed in a very serious dilemma. I expected, from day to day to hear from Mr. Geo. Brown, and while waiting I occupied myself in writing and rewriting my specification. I felt that I had made a great invention. That I had invented what is now know as 'The Speaking Telephone.' I tried to embody this in my specification, and to express it in language that should be scientifically accurate and complete, and to the best of my ability I did so.

(C. Vol. 2, page 1678, Ans. 563.)

The terms "undulatory current" and "electrical undulations" were new in the nomenclature of electricty, although the current itself, as the record shows, had been utilized by Wheatstone and others before.

Mr. Bell, therefore, at once proceeds, with intellegent purpose to describe the "undulatory current" and its "undulations" as follows:

"It has long been known that when a permanent magnet is caused to approach the pole of an electro-magnet, a current of electricity is induced in the coils of the latter, and that when it is made to recede, a current of opposite polarity to the first appears upon the wire. When, therefore, a permanent magnet is caused to *vibrate* in front of the pole of an electro-magnet, an undulatory current of electricity is induced in the coils of the electro-magnet, the undulations of which correspond in rate of succession to the vibrations of the magnet, in polarity to the direction of its motion and in intensity to the amplitude of its vibration.

This is an explicit statement, exactly to the effect that the vibrations of a permanent magnet, in front of the pole of an electro-magnet, induces an "undulatory current of electricity," the "undulations" of which have certain characteristics. These "undulations" "correspond in rate of succession to the vibrations of the magnet, in polarity to the direction of its motion, and in intensity to the amplitude of its vibration."

Why, the "undulatory" current thus described is, by its very terms, nothing more nor less than our old acquaintance the "magneto-electric" current; the *principle* and the *use* of which Mr. Bell deemed it so important to patent, when he wrote his letter of August 14th. We find him now, indeed, engaged in the intelligent execution of the very purpose he then indicated.

But Mr. Bell would avoid even the possibility of a mistake. He proceeds, therefore, to further define the undulatory current, by pointing out in unmistakable terms its essential difference from an intermittent current, and he would have this difference clearly understood.

"That the difference between an undulatory and an intermittent current may be more clearly understood. I shall describe the condition of the electric current, when the attempt is made to transmit two musical notes simultaneously; first upon the one plan and then upon the other. Let the interval between the two sounds be a major third. Then their rates of vibration are in the ratio of 4, 5.

"Now, when the intermittent current is used, the circuit is made and broken four times by one transmitting instrument in the same time that five makes and breaks are caused by the other.

"A and B (Fig. I, II, III) represent the intermittent currents produced; four impulses of A being made in the same time as five impulses of B; c, c, c, etc., show where and for how long time the circuit is made, and d, d, d, etc., indicate the duration of the breaks of the circuit.

"The line A and B, shows the total effect upon the current, when the transmitting instruments for A and B are caused simultaneously to make and break the same circuit. The resultant effect depends very much upon the duration of the make relatively to the break. In Fig. I the rate is as 1: 4; in Fig. II, as 1: 2; and in Fig. III, the makes and breaks are of equal duration.

"The combined effect, A and B (Fig. III) is very nearly equivalent to a continuous current.

"When many transmitting instruments of different rates of vibration are simultaneously making and breaking the same circuit, the current upon the main line becomes for all practical purposes continuous.

"Next consider the effect when an undulatory current is employed.

"Electrical undulations induced by the vibration of a body, capable of inductive action can be represented graphically without error by the same sinusoidal curve which expresses the vibration of the inducing body itself, and the effect of its vibration upon the air. For as above stated the rate of oscillation in the electrical current corresponds to the rate of vibration of the inducing body; that is, the pitch of the sound produced. The intensity of the current varies

with the amplitude of the vibration; that is, with the loudness of the sound, and the polarity of the current corresponds to the directionof the motion of the vibrating body; that is to the condensations and rarefactions of air produced by the vibration. Hence the sinusoidal curve A or B (Fig. IV) represents graphically the electrical undulations induced in a circuit by the vibration of a body capable of inductive action.

"The horizontal line (a, d, b, f) represents the zero of current; the elevations (c, c, c) indicate impulses of positive electricity; the depressions (e, e, e) show impulses of negative electricity; the vertical distance (cd or ef) of any portion of the curve from the zero line expresses the intensity of the positive or negative impulse at the part observed, and the horizontal distance (a, a) indicates the duration of the electrical oscillation.

"The vibrations represented by the sinusoidal curves A and B (Fig. IV) are in the ratio aforesaid, of 4:5—that is, four oscillations of A are made in the same time as five oscillations of B.

"The combined effect of A and B, when induced simultaneously on the same circuit, is expressed by the curve A + B (Fig. IV) which is the algebraical sum of the sinusoidal curves A and B. This curve (A + B) also indicates the actual motion of the air when the two musical notes considered are sounded simultaneously.

"Thus, when electrical undulations of different rates are simultaneously induced in the same circuit, an effect is produced exactly analogous to that occasioned in the air by the vibration of the inducing bodies.

"Hence the co-existence upon a telegraphic circuit of electrical vibrations, of different pitch is manifested—not by the obliteration of the vibratory character of the current, but by peculiarities in the shapes of the electrical undulations; or, in other words, by peculiarities in the shapes of the curves which represent those undulations."

Mr. Bell says:

"Next consider the effect when the undulatory current is employed."

In this discussion every characteristic of this "effect" is attributed directly to the qualities this current possesses by virtue of its origin; in other words, to the qualities of the magneto-electric current.

The reasoning is clear, close and logical. Arranging it in logical sequence it is substantially as follows:

The vibrations of an inducing body produce upon a circuit electrical undulations, or an oscillating current. They also produce sonorous vibrations in the air.

Comparing now the effects upon the circuit with the effects in the air, certain remarkable correspondences are observed.

The rate of oscillation in the electrical current corresponds to the rate of vibration of the inducing body. This rate of oscillation, therefore, corresponds to the rate of the aerial sound vibrations; that is, to the pitch of the sound. The intensity varies with the amplitude of the vibration, and it, therefore, corresponds to the amplitude of the aerial vibrations; that is, to its effect as expressed in the loudness of the sound. The polarity, or direction of the current, corresponds to the direction of the motion of the vibratory body, and it, therefore, corresponds to the direction of the motion in the aerial vibration; that is, to the condensations and rarefactions of air produced by the vibration.

Consequently, the same curve that would represent mathematically the three variations taking place in the current upon the circuit, would also accurately represent the three corresponding variations taking place in the aerial movement.

This curve would also, of course, represent equally the three phases of variation occurring in the motion of the inducing body itself.

The same curve would, therefore, express graphically, and without error, the three phases of variation occurring simultaneously, and in exact correspondence in three different realms, to wit: in the motion of the inducing body itself, in the aerial vibrations set up in the air, and in the electrical undulations caused upon the circuit.

To prevent even the possibility of a mistake he illustrates and describes this curve in examples A and B (Fig. IV).

"The horizontal line (a, d, b, f) represents the zero of currents; the elevations (c, c, c) indicate impulses of positive electricity; the depressions (e, e, e) show impulses of negative electricity; the vertical distance (cd or ef) of any portion of the curve from the zero line expresses the intensity of the positive or negative impulse at the part observed, and the horizontal distance (a, a) indicates the duration of the electrical oscillation."

A definite mathematical meaning is thus impressed upon the curve in its expression of each of the three phases of change occurring, for example, in the current.

The horizontal line represents the zero of current. The polarity of the impulse or electrical undulation at any instant of time is expressed by the position of a point in that curve, at the instant, either above or below the horizontal line, the elevations expressing positive, and the depressions negative impulses. The vertical distance of that point from the horizontal line expresses accurately the relative intensity of the electrical impulse at that instant; while the duration of each electrical impulse is expressed by the horizontal distance along the line occupied in the tracing of the curve of that impulse.

He states thus carefully the mathematical properties of this curve, because the observance of their *mathematical* values is made the very basis of the deductions which follow.

He states that the vibrations represented by the sinusoidal curves A and B, in the examples given, are in the ratio of four to five, as regards the respective rates of oscillation they severally represent.

He then states that "The combined effects of A and B, when induced simultaneously on the same circuit is expressed by the curve A + B (Fig. IV), which is the *algebraic sum* of the sinusoidal curves A and B."

The veriest tyro in mathematics will understand from this statement that the two curves are to be added together, forming a single resultant curve, and that in performing this addition distances from the horizontal line existing in the two curves at any instant of time are to be "algebraically" added; that is, if both distances in the two curves are positive, or above the line, the resultant distance, at the instant, will be above the line and equal to their sum; if both are negative or below the line, the resultant distance will still be equal to their sum, but it will remain negative, and be measured below the line. If at any instant, the distance from the horizontal line is positive in one curve and negative in the other, the less will be subtracted from the greater, and the difference will be the resultant distance to be measured above or below the line, accordingly as the greater distance in the two curves is positive or negative. This resultant curve, therefore, will represent graphically, and with mathematical accuracy, the resultant oscillations or undulations of the current, actually flowing on the circuit, when two sets of undulations are being induced by the simultaneous vibrations of two inductive bodies. Again, "this curve (A + B) also indicates the actual motion of the air when the two musical notes considered, are sounded simultaneously."

Therefore, the effect produced in the current "when electrical undulations of different rates are simultaneously induced in the same circuit" is "exactly analogous to that occasioned in the air by the vibration of the inducing bodies."

But in the air, "the two musical notes considered" are transmitted simultaneously, without interference and without obliteration, through the "resultant" aerial impulses which are represented graphically by the same resultant curve which represents also the effects produced simultaneously in the current.

Hence the co-existence upon a telegraphic circuit of electrical vibrations of different pitch, is manifested not by the obliteration of the vibratory character of the current, but by the peculiarities in the shapes of the electrical undulations; or in other words, by peculiarities in the shapes of the curves which represent those undulations.

A careful study of the previous history of the development of Mr. Bell's conception of the working of the induced magneto-electric current has made this chain of reasoning already familiar and easily comprehended.

The distinctions characteristic of what Mr. Bell here terms the "undulatory current," both as regard its origin and the *modus operandi* of its movement upon the line, Mr. Bell has now made "clearly understood."

The magneto-electric current is the only current which possesses the characteristics embodied in the definitions here given of the "undulatory current," and the magneto-electric impulses alone correspond in their constitution to the essential qualities here attributed to "electrical undulations."

The whole fabric of Mr. Bell's reasoning, by which he has arrived at certain advantageous conclusions, is based directly upon the possession, by the "undulatory" current, of the very qualities which alone characterize the magneto-electric current.

The conclusion is inevitable, from the definitions here given by Mr. Bell, that the "undulatory" current is the magneto-electro-current, induced by the vibration of inductive bodies. But the last lingering doubt, if any exist, is removed by the tenor of the very next sentence in the specification.

"There are many ways of producing undulatory currents of electricity, but all of them depend for effect upon the vibration or motion of bodies capable of inductive action."

Further discussion as to the meaning and intent of the language employed would be puerile.

Mr. Bell's statement that this "present invention consists in the employment of a vibratory or undulatory current of electricity in place of a merely intermittent one; and of a method of and an apparatus for, producing electrical undulations upon the line wire," is thus clearly seen to be a statement made directly in the execution of the purpose he had formed to patent "the use of the magneto-electric-current."

Continuing in the orderly development of the specification, Mr. Bell proceeds to point out generally a few of the methods that may be employed to produce the undulatory current.

"A few of the methods that may be employed I shall here specify.

"When a wire through which a continuous current of electricity is passing is caused to vibrate in the neighborhood of another wire, an undulatory current of electricity is induced in the latter.

"When a cylinder upon which are arranged bar-magnets is made to rotate in front of the pole of an electro-magnet, an undulatory current is induced in the coils of the electro magnet.

"Undulations may also be caused in a continuous voltaic current by the vibration or motion of bodies capable of inductive action, or by the vibration of the conducting wire itself in the neighborhood of such bodies."

Mr. Bell then proceeds to show and describe one particular form of apparatus, in illustration of the method of creating electrical undulations. He explains its mode of operation, and also its application to the purposes of multiple telegraphy, as follows:

"In illustration of the method of creating electrical undulations, I shall show and describe one form of apparatus for producing the effect.

"I prefer to employ for this purpose an electro-magnet (A, Fig. V), having a coil upon only one of its legs. (6.) A steel spring armature (c) is firmly clamped by one extremity to the uncovered leg (d) of the magnet, and its free end is allowed to project above the pole of the covered leg. The armature (c) can be set in vibration in a variety of ways (one of which is by wind), and in vibrating it yields a musical note of a certain definite pitch.

"When the instrument (A) is placed in a voltaic circuit (g, b, e, f, g,) the armature (c) becomes magnetic, and the polarity of its free end is opposed to that of the magnet underneath. So long as the armature (c) remains at rest, no effect is produced upon the voltaic current, but the moment it is set in vibration to produce its musical note a powerful inductive action takes place, and electrical undulations traverse the circuit (g, b, e, f, g.) The vibratory current passing through the coils of the distant electro-magnet (f) causes vibrations in its armature (h) when the armatures (c, h) of the two instruments (A, I) are nominally in unison with one another; but the armature (h) is unaffected by the passage of the undulatory current when the pitches of the two instruments (A, I) are different.

"A number of instruments may be placed upon a telegraphic circuit (as in Fig. VI). When the armature of any

Fig V SB 15

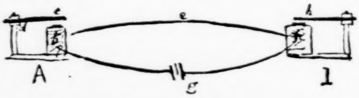

Fig VI

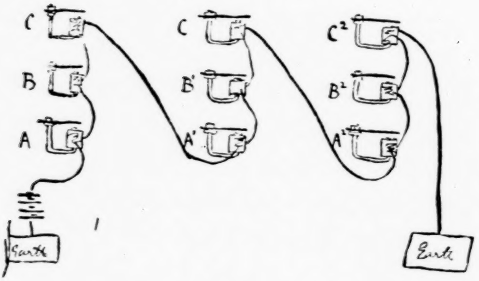

Fig VII

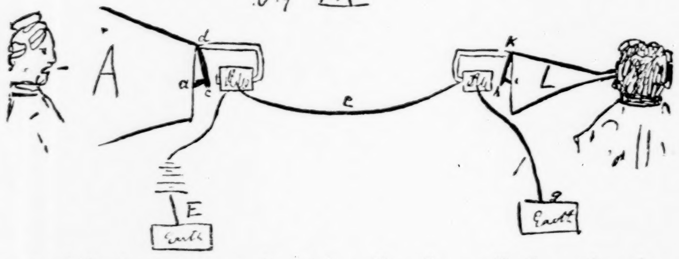


one of the instruments is set in vibration, all the other instruments on the circuit, which are in unison with it, respond, but those which have normally a different rate of vibration remain silent. Thus, if A. (Fig. VI.) is set in vibration, the armatures of A ^{1} and A ^{2} will vibrate also, but all the others on the circuit remain still. So, also, if B^1 is caused to emit its musical note, the instruments B, B^2 respond. They continue sounding so long as the mechanical vibration of B^1 is continued, but become silent the moment its motion stops. The duration of the sound may be made to signify the dot or dash of the Morse alphabet, and thus a telegraphic dispatch can be transmitted by alternately interrupting and renewing the sound.

"Where two or more instruments of different pitch are simultaneously caused to vibrate, all the instruments of corresponding pitches upon the circuit are set in vibration, each responding to that one only of the transmitting instruments with which it is in unison. Thus the signals of A are repeated by A^1 and A^2, but by no other instruments upon the circuit; the signals of B^2 by B and B,^{1} and the signals of C^1 by C and C,^{2} whether A, B^2 and C^2 are successively or simultaneously set in vibration.

"Hence by these instruments, two or more telegraphic signals or messages may be sent simultaneously over the same circuit without interfering with one another.

"I desire here to remark that there are many other uses to which these instruments may be put, such as the simultaneous transmission of musical notes differing in *loudness* as well as in pitch, and the telegraphic transmission of noises or sounds of any kind.

"When the armature (c) (Fig. V) is mechanically set in vibration the armature (h) responds, not only in pitch, but in loudness. Thus when c vibrates with little amplitude, a very soft musical note proceeds from h, and when c vibrates forcibly the amplitude of vibration of h is considerably increased, and the sound becomes louder. So if A and B (Fig. VI) are sounded simultaneously, (A loudly and B softly,) the instruments A,^{1} A^2 repeat loudly the signals of A, and the instruments B,^{1} B^2 repeat gently those of B."

We now come to a most interesting part of the application. In the apparatus previously described, the armature had been mechanically set in vibration, and one of the ways had been stated to be by wind. Mr. Bell now proceeds to show another mode "whereby motion can be imparted to the armature by means of the human voice, or by the tones of a musical instrument."

"One of the ways in which the armature (c) (VI) may be set in vibration has been stated above to be by wind."

"Another mode is shown (in Fig. VII) *whereby* motion can be imparted to the armature by means of the human voice, or by the tones of a musical instrument.

"The armature (Fig. VII) is fastenod loosely by one extremity to the uncovered pole (d) of the electro-magnet (b), and its other extremity is attached to the center of a stretched membrane (a). A cone, A, is used to converge sound vibrations upon the membrane. When a loud sound is uttered in the cone the membrane (a) is set in vibration; the armature c is forced to partake of the motion, and thus electrical undulations are caused upon the circuit (E b, e, f, g). These undulations are similar in *form* to the air vibrations caused by the sound, that is, they can be represented graphically by similar curves. The undulatory current passing through the electro-magnet (f) influences its armature, (h) to copy the motion of the armature (c). A similar sound to that uttered into A is then heard to proceed from L."

The theory of the operation of the illustrative device here unfolded is one with which the previous history has made us perfectly familiar.

The utterance by the human voice of a loud sound into the cone sets the membrane in vibration, theoretically, a vibration corresponding accurately to the vibration of the air particles transmitting the sound. The armature attached at its lower end to the membrane is forced to vibrate with it, and these vibrations of the armature produce electrical undulations upon the circuit. These undulations conform exactly in every phase of their variation to the air vibrations.

"These undulations are similar in *form* to the air vibrations caused by the sound, that is, they can be represented graphically by similar curves."

Mr. Bell, as we have seen, had already indicated in the specification in unmistakable terms the definite meaning of this last expression. In the previous discussion of the *modus operandi* of the undulatory current, he had shown that the curves representing the three phases of variation occurring under these circumstances, respectively, in the motion of the armature, in the air vibrations, and in the electrical undulations of the current, were alike in every respect.

This he attributed directly to the exact correspondence existing between the vibratory movement in the current, in the air, and in the motion of the armature, and in each case, in the three vital characteristics of rate, direction and intensity. This was the essential similarity in form in the three cases, represented graphically by a similarity in curve.

Mr. Bell further states that the undulatory current passing through an electro-magnet in the receiver, influences its armature to copy the motion of the transmitting armature, and as a result, a "similar sound" to that uttered into the cone in the transmitter is heard to proceed from the cone in the receiver.

Here again we find in this specification simply the elaboration of the idea concisely expressed by Mr. Bell in his letter of August 14, regarding the magneto-electric current:

> "When we can create a pulsatory action of the current, which is the *exact equivalent* of the aerial impulses, we shall certainly obtain exactly similar results."

As if in the avowed purpose to use every precaution to prevent even the possibility of any misunderstanding, Mr. Bell then proceeds to further define the terms employed in the specification as follows:

> "In this specification the three words, 'oscillation,' 'vibration' and 'undulation' are used synonymously. By the term 'body capable of inductive action' I mean a body which, when in motion, produces dynamical electricity. I include in the category of bodies capable of inductive action, brass, copper and other metals, as well as iron and steel."

The term "undulation" which appears in the general statement of the invention, and in the claims, is thus further defined as being used in a sense synonymous with the the words "oscillation" and "vibration." Webster defines these terms as follows:

> "*Oscillation.* The act of oscillating; a moving backward and forward or swinging like a pendulum; vibration."
>
> "*Vibration.* 1. The act of vibrating, or the state of being vibrated, or in vibratory motion; quick motion to and fro: oscillation, as of a pendulum, or musical cord.
>
> "2. (*Physics.*) A limited reciprocating motion of the particles of an elastic body or medium in alternately opposite directions from their positions of equilibrium, when that equilibrium has been disturbed; as of a stretched cord or other body in producing musical notes, or of particles of air in transmitting sounds to the ear."

This "backward and forward" motion, "to and fro," "in alternately opposite directions," is thus definitely included within the essential meaning of the term "undulatory," as used in the specification. This is exactly in accordance with Mr. Bell's theory as there unfolded, and it expresses perfectly the characteristic movement of the magneto-electric current.

We have now quoted the entire specification except the claims, which are as follows:

" Having thus described my invention, what I claim and desire to secure by letters patent is as follows:

1. A system of telegraphy in which the receiver is set in vibration by the employment of undulatory currents of electricity.

2. The combination of a permanent magnet, or other body capable of inductive action with a closed circuit, so that the vibration of the one shall produce electrical undulations in the other or in itself.

Thus (a) The permanent magnet, or other body capable of inductive action, may be set in vibration in the neighborhood of the conducting wire forming the circuit.

(b) The conducting wire may be set in vibration in the neighborhood of the permanent magnet.

(c) The conducting wire and the permanent magnet may both simultaneously be set in vibration in each other's neighborhood; and in any or all of these cases electrical undulations will be produced upon the circuit.

3. "The method of producing undulations in a continuous voltaic current by the vibration or motion of bodies capable of inductive action, or by the vibration or motion of the conducting wire itself in the neighborhood of such bodies.

4. " The method of and apparatus for transmitting vocal or other sound telegraphically, as herein described, by causing electrical undulations similar in form to the vibrations of the air accompanying the said vocal or other sounds."

Mr. Bell has so clearly explained, in the body of the specification, the precise meaning of the terms employed in these claims, that he has made their intent and meaning exceedingly plain.

The first claim for " a system of telegraphy in which the receiver is set in vibration by the employment of undulatory currents of electricity," obviously covers the use of undulatory currents of electricity in the operation of telegraph instruments, especially in multiple telegraphy, as illustrated in Figs. 5 and 6.

The second claim for "the combination of a permanent magnet, or other body capable of inductive action, with a closed circuit, so that the vibration of the one shall produce electrical undulations in the other or in itself," covers broadly the combination of an electro-magnet and an armature upon a closed circuit, and embraces within its terms all the apparatus illustrated in the drawing and described in the specification.

It has, however, been withheld from controversy in this case, for the obvious reason that the combination in its simplest form was as old as the knowledge of the magneto-electric current.

The third claim for "the method of producing undulations in a continuous voltaic current by the vibration or motion of bodies capable of inductive action, or by the vibration or motion of the conducting wire itself in the neighborhood of such bodies," is broadly for the method of producing undulations in a continuous voltaic current by vibration as expressed, and covers broadly all the apparatus illustrated in the drawing. It is, however, withheld from issue in this case, apparently for the same reason as claim two.

The fourth and final claim for "the method of and apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations similar in form to the air vibrations accompanying the said vocal or other sounds," by its terms covers broadly both the methods therein designated, and the apparatus operating as there specified. *

It is observable that a broad distinction is made between

---

* NOTE.—(C. 2. page 1695, Bell, Q. 605.) Will you look at the paragraph of your first patent, March 7, 1876, which begins: "The advantages I claim to derive from the use of an undulatory current in place of an intermittent one are," and then enumerates five advantages—and state whether, according to your opinion and belief at the time, those advantages ensued from the employment of a current which was undulatory instead of intermittent, regardless of the form of the undulations, or whether the attainment of those ad

the "undulatory currents," the "electrical undulations," and the "undulations," included, respectively, within the first, second, and the third claims, and the "electrical undulations" specified in the fourth claim.

In the first three claims these terms are expressed without limitation, and include *all* undulatory currents and electrical undulations.

In the fourth claim, however, not all electrical undulations are included, but only those of a specific kind, to wit, those "similar in form to the vibrations of the air accompanying the said vocal or other sounds."

The reason why Mr. Bell made this important distinction is clearly manifest. In the body of the specification he had described a number of ways of producing undulatory currents. While these were all capable of possible application, for example, to the purposes of multiple telegraphy, and so were embraced within the terms of the first claim, they were not all capable of use in the electrical transmission of speech.

Thus, one method was described as follows:

"Where a cylinder upon which are arranged bar-magnets, is made to rotate in front of the pole of an electro-magnet an undulatory current is induced in the coils of the electro-magnet."

Mr. Bell had actually made some attempt to utilize undulatory currents obtained in this way for purposes of multiple telegraphy. (C. Vol. 4, pages 986 and 988, and Figs. 17 and 24, *ante*, page 71) Obviously, however, they were wholly unsuitable for use in the transmission of speech.

In this fourth claim, therefore, Mr. Bell sought to designate with "scientific accuracy" exactly those electrical undulations which he was convinced would be effective in the transmission of speech.

He did this "to the best of his ability" and, in the light

---

vantages required the production of some special form of electrical undulations as distinguished from other forms of electrical undulations?

Ans. I believed at the time that the advantages enumerated ensued from he employment of a current which was undulatory instead of intemittent; quite regardless of the form of the undulations.

of the definitions expressed in the body of the specifications, thereby limited himself, plainly and unmistakably, first, to the use of the electrical undulations of the *magneto-electric* current, and second, to the use of those electrical undulations only which are "similar in form to the vibrations of the air accompanying the said vocal or other sounds."

Every part of the specification was thus consistent with every other part and with the whole, and altogether it afforded a complete fulfillment of the purpose outlined by Mr. Bell in his letter of August 14th and a perfect exemplification of his *principle* and of his admirable *theory* regarding the electrical transmission of speech.

XVIII.

Having concluded our analysis of the "George Brown specification" we proceed next in the order of historical development to a consideration of the specification included in Mr. Bell's application for the patent filed in the patent office, February 14, 1876, as it appears in the photo-lithographic copy produced by complainants and printed in the record. (Add. proofs, page 729.)

We find that this specification is substantially the same as the "George Brown specification," except that it contains new matter of a somewhat remarkable character, and an additional claim based upon this new matter as follows:

> "Electrical undulations may also be caused by alternately increasing and diminishing, the resistance of the circuit, or by alternately increasing and diminishing the power of the battery."
>
> "The internal resistance of a battery is diminished by bringing the voltaic elements nearer together, and increased by placing them further apart. The reciprocal vibration of the elements of a battery therefore occasions an undulatory action in the voltaic current. The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit, then the more deeply the conducting wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current. Hence the vibration of the conducting wire in mercury or other liquid included in the circuit occasions undulations in the current. The vertical vibrations of the elements of a battery in the liquid in which they are immersed produce an undulatory action in the current by alternately increasing and diminishing the power of the battery."
>
> "4. The method of producing undulations in a continuous voltaic circuit by gradually increasing and diminishing the power of the battery as set forth."

The old fourth claim in the "George Brown specification" is retained and numbered 5, in the new specification. Moreover, as the new matter is inconsistent with the statement in the "George Brown specification," that "There are many ways of producing undulatory currents of electricity, but all of them depend for effect on the vibration or motion of bodies capable of inductive action," this is amended so as to read as follows:—

"There are many ways of producing undulatory currents of electricity, dependent for effect upon the vibrations or motions of bodies capable of inductive action."

The pertinent question at once arises, what effect or bearing does the interjection of this new matter have upon the old claims retained in this specification, and what construction is now properly to be placed upon them?

It is clearly manifest that in the new nomenclature adopted, the "undulatory" current is no longer exclusively the magneto-electric current. The term is now applied also to a continuous battery current, in which the intensity is varied either by varying the resistance in the circuit, or by varying the power of the battery.

The logical consequence is that when this newly described undulatory current is employed in a system of telegraphy to set the receiver in vibration, its use for this purpose is covered by the very terms of the first claim.

"A system of telegraphy in which the receiver is set in vibration by the employment of undulatory currents of electricity, substantially as set forth."

(The question is here considered, waiving for the present any adverse view founded upon the very significant absence of any attempted description of an apparatus for the utilization of this form of current.)

It is an equally logical consequence that, should this newly described current be applied to the transmission of speech, its use for this purpose would be covered by the fifth claim, provided the electrical vibrations caused were actually "similar in form to the vibrations of the air accompanying the said vocal or other sounds," as that expression is defined in the body of the specification; but otherwise, such use would clearly be outside of the terms of that claim.

It is noticeable that, either owing to carelessness or haste on the part of Mr. Bell, when this passage was interjected into the specification, or, on the other hand, owing to a belief on his part that, while this newly described current might be applicable to the purposes of multiple telegraphy, it was unsuitable for the transmission of speech, Mr. Bell did not even make the attempt to change the explicit definitions given in the body of the specification of the phrase "similar in form to the vibrations of the air, etc."

This phrase therefore, which specifies the essential characteristic of those electrical undulations, which alone are included within the terms of that claim, retains exactly the meaning it had in the George Brown specification.

It is unnecessary to repeat here our discussion of that meaning as fixed by the terms of the specification. It is sufficient to state that the "similarity in form" between the air vibrations and the electrical undulations was based unequivocally upon the common possession in each case of three analogous phases of variation, which continued throughout in exact correspondence in both cases. Where curves are drawn therefore which would express mathematically, with their recognized graphical values, each of these three phases in the two cases, those curves would be exactly similar to each other.

The three essential phases of variation considered by Mr. Bell in his discussion in the specification were variations in rate, direction of movement and amplitude or intensity of the impulse in each case. All three are inherent characteristics of a magneto-electric current caused by the vibration of an armature under the impulses of the air vibrations communicating a sound.

But only two of these are inherent in the newly described current of varying resistance. The current flows continuously in one direction only, and in this essential respect, that exact correspondence to the vibrations of the air utterly fails, and with it that "similarity of form," based by Mr. Bell directly upon that exact correspondence.

Consequently, the newly described current of varying resistance has not been claimed by Mr. Bell, in this patent, for use in the transmission of speech, but for multiple telegraph purposes alone.

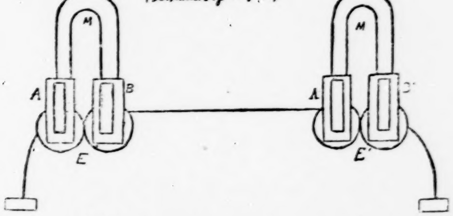
Moreover, the *modus operandi* of the newly described current of varying resistance, when employed in the transmission of speech, is wholly different from that of the magneto-electric current under similar circumstances.

Where the magneto-electric current is induced by the vibration of an armature, set in motion by the corresponding air vibrations communicating a sound, the variations taking place in the current correspond exactly to the variations simultaneously occurring in the motion of the vibrating armature and of the air particles. There is not only an exact correspondence in the *direction* of the movement in the three cases, but there also exists an exact and instantaneous correspondence in the relative *intensity* in the three cases.

Mr. Bell has clearly explained the *rationale* of this correspondence in intensity as follows:

"I understood from the well known laws of magneto-electricity that a current of electricity would be induced in the coils of the electro-magnet E. Fig. 7 (15)

FIG 15
(Summer of 1874)



when any one of the transmitting reeds A moved downward or upward, and that the *strength* of the current would be proportional to the *velocity of the motion* of the reed. I therefore inferred that as the velocity of the motion of the reed was increased when the amplitude of its vibration was increased, that the strength of the current produced by the vibration was also increased.

"(C. Vol. 2, page 117, Ans. 35.)"

Complainant's able counsel in the argument in the court below further explained this matter in a singularly clear and lucid manner, as follows:

"If I move this armature or piece of metal up to the core of the magnet, I shall also excite in the electricity a tendency to flow. If I move the piece of metal up to it, the tendency of the current, generated by the expenditure of the force of any of my fingers, is to flow in one direction. If I move the piece of metal away, the tendency is to flow in another direction. Now, it is not the *position* of the armature which makes the current. There is no more current when the armature is close to the magnet than there is when it is in the next room. It is the *motion* of the armature which makes the current. In other words, it is the expenditure of the force of my fingers which generates or is the cause of the electrical disturbance and flow. And, in as much as it is not the *position* of the armature but only the *motion* which generates the current, it necessarily follows that as long as you move this piece of metal within the magnetic reach, the current is flowing in that coil and the connected circuit. When I stop moving it, no matter where I stop, the current stops too.

"That is not all. That current, in its flow, is due to the motion of the armature. If I move the armature gently, the current is gentle; if I move it violently, the current becomes violent. Your Honor sees very well, therefore, that the currents which are produced in this contrivance have to correspond to the motion of this piece. So long as this moves the current flows; if this moves violently, the current flows violently; if it moves gently, the current flows gently. You can therefore fairly say that all the currents represent, or are copies of, the motion of this. If now, instead of moving this by my finger, I use as armature a thin disk of sheet iron and speak to it, the vibrations produced in the air by my voice move that thin disk just as they would move the drum of the listener's ear and in quite the same way. This thin, elastic material can and will move in the same way if supported properly at the edges. Suppose now, that instead of using this thing which I hold in my hand and wave in front of the magnet, I place here this thin diaphragm, supporting its edges on a frame in front, and speak to it. Then it will move, and every motion of this disk which constitutes the armature (so prompt and so accurate is the performance of the apparatus), every motion of it to and fro, as it vibrates, generates a current in these coils which will correspond to the motion just as it did when I moved the heavy armature with my hand. The motions of the electricity in the coil, or, so to speak, the currents of electricity, will correspond to and will be the copies of the vibratory motions of this plate.

"One more thing: If I speak to that, the motions of this plate are copies of the vibrations of the air particle. My voice moves one particle, and that moves the next one, and that moves the next one, and thus the same motion is communicated through them to the disk; it not merely makes it vibrate, but makes it vibrate in the same way, manner and fashion, causing this to perform the same *form* of vibration. What is the consequence? Why, that the currents which the motion of this produces in obedience to itself, in this coil, are themselves the copies of the motions of that armature disk, which are the copies of the motion of that air particle; so that the currents may very properly be said to be copies of the very motions of the air particle agitated by my voice. If the agitation of the air particle is at any instant violent, the current becomes more violent; if the agitation of the air particle is less violent, the current at once weakens. Now it is true, not merely when I move the particles of air, not merely when I move the armature to and fro, that the currents arise, but if, while moving the armature from one extreme of its vibratory path to the other, I move it fast during the first part of the path, then the current at that instant is stong, and if I move it slow during the next portion of the same movement, the current is weak. Let it return part of its way on its path, and the current returns on its path. The changes of current, therefore, are copies of the motions of the armature, not merely in respect to the time during which the total motion takes place, not merely in respect to the mean violence of the movement of the armature during its total motion, but in respect to every change which can take place in the motion of the armatures while the motion from one extreme to the other is being performed. The currents, therefore, will not correspond merely in number to the vibrations of the armature (and the air particles which move it) but they still correspond in their *character* to what I have described as the *form* of the vibration which the armature and its actuating air particle perform."

(Argument of J. J. Storrow in U. S. C. C., Southern District of New York, page 12. The *italics* are Mr. Storrows.)

On the other hand, and in severe contrast, the continuous current of varying resistance, when used under the same circumstances, in the transmission of speech, operates in a totally different manner. It is not the *motion* of the armature which makes the current. It is the *position* of the armature which makes the current. And, inasmuch as it is not the *motion* of the armature, but only the *position* which regulates the current, it necessarily follows that the moment of greatest intensity in the current on the line is when the position of the diaphragm is such as to impose the greatest pressure on the carbon, for example, and thus diminish to the least degree the resistance to the flow of the current. This occurs when the diaphragm is in position at one extreme limit of its vibration. On the other hand, the moment of least intensity in the current occurs when the diaphragm is at a position at the opposite limit of its vibration.

Note now the radical difference in the *modus operandi* of the two currents when operated simultaneously by diaphragms acted upon by the voice.

With the magneto-electric current, when the diaphragm is for the instant without motion, at the extreme limit and turning point of its vibration, the current is at zero, or without existence. As the motion of the diaphragm commences and increases to a maximum at the center of its vibration, the intensity of the current, induced by this motion, correspondingly increases also to a maximum at the same point. And in the movement of the diaphragm from the center to the other limit of its vibration, its motion and the intensity of the current are correspondingly decreased to zero at the limit. There is thus afforded in the entire movement that perfect correspondence in *form* so clearly set forth by complainants' counsel in the passage above quoted

While the diaphragm has thus passed through one vibration in one direction, its motion and also the intensity of the induced electrical impulse have together each passed through two phases of change, to-wit; first, an *increase* from zero at the outset to a maximum at the center, and then a *decrease* to zero again at the farther limit.

On the contrary, with the current of varying resistance, when the diaphragm has thus passed through one vibration in one direction, the intensity (or more properly the quantity) of the current has passed through only one phase of change, to wit, *a continual increase* of intensity during the whole passage of the diaphragm from one limit to the other of its movement.

Instead of an *exact correspondence* there is no correspondence in *form* whatever between the two currents. As one of them, to wit, the magneto-electric current thus induced, is "similar in form" to the air vibrations, the current of varying resistance *is not* and *can not* be thus "similar in form." Two things which are not similar to each other can not both be similar to a third thing.

XIX.

Next in order comes a brief consideration of the amendment to the original specification filed in the Patent Office as follows (C. Vol. 4, page 16):

"In the matter of the application of A. Graham Bell, for patent for improvements in telegraphy filed February 14, 76."

"In this matter amend the specification as follows:

"Page 2, erase line 19 to line 24 inclusive, and substitute therefor the following:

In appending application for letters patent, filed in the U.S. Patent Office, February 25, 1875, I have described two ways of producing the intermittent current, the one by actual make and break of contact, the other by alternately increasing and diminishing the intensity of the current, without actually breaking the current; the current produced by the latter method I shall term for distinction's sake, a pulsatory current.

"My present invention consists in the employment of a vibratory or undulatory current of electricity, in contradistinction to a merely intermittent or pulsatory current, and of a method of, and apparatus for, producing electrical undulations upon the line wire.

"The distinction between an undulatory current and a pulsatory current will be understood, by considering that electrical pulsations are caused by sudden or instantaneous changes of intensity, and that electrical undulations result from *gradual* changes of intensity exactly analogous to the changes in the density of air, occasioned by simple pendulous vibrations. The electrical movement, like the aerial motion, can be represented by a sinusoidal curve, or by the resultant of several sinusoidal curves.

"Intermittent or pulsatory and undulatory currents may be of two kinds, accordingly as the successive impulses have all the same polarity, or are alternately positive and negative.

"Page 13, line 15, after 'synonymously' (insert and in contradistinction to the terms 'intermittent' and 'pulsatory."

"In the 4th claim, erase the word 'alternately' whenever it occurs, and substitute therefor the word ('gradually.')

"Pollok & Bailey,
"Attys. for A. Graham Bell."

On careful examination there is here developed the remarkable fact that each of the three items of this amendment is inserted solely for the purpose of further explaining and elucidating the new passage, which had been interjected into the specification, and which, as we have seen, was not contained in the "George Brown specification."

The last item, "In the 4th claim, erase the word 'alternately' whenever it occurs, and substitute therefor the word ('gradually,')," is made explicitly in amendment of the new fourth claim.

As regards the second item of the amendment; the statement contained in the original specification, "In this specification the three words 'oscillation,' 'vibration' and 'undulation' are used synonymously," had, as we have already seen, limited the significance of the word "undulation" as used in the claims, to a meaning including an essential backward and forward, to and fro movement. This meaning was exactly adapted to express the characteristic movements of the magneto-electric current, which alone was originally claimed.

But it did not fit the newly described current of varying resistance, and, indeed, it expressly excluded it.

A careful consideration could not fail to reveal such a discrepancy; but for some reason the statement was not struck out by an official amendment, but instead, its meaning was deftly shaded off by the addition of the words "in contradistinction to the terms 'intermittent and pulsatory.'"

Again the distinction between the "undulatory" current, as limited to the magneto-electric current, and the "intermittent" current had been intelligently discussed at great length in the body of the specification. The newly described current was a continuous battery current varying in its intensity. But a continuous battery current which was varied "by alternately increasing and diminishing the intensity of the current, without actually breaking the circuit" had been already described in another pending application filed by Mr. Bell, Feb. 25, 1875.

The most casual consideration must have revealed to Mr. Bell and his attorneys, the propriety, and even the necessity of distinguishing between two such similar currents. Accordingly, the first item of the amendment was inserted so as to point out the essential distinctions. This was done by the introduction of still another new term, "pulsatory," which admirably served the purpose.

Mr. Bell, in his sworn Preliminary Statement in the Speaking Telephone Interferences, made the following statement: (C. Vol. 4, page 1010.)

"I completed the specification for my American patent early in January, and sent it to Mr. Hubbard in Washington, to be examined by Mr. Pollok. I am not able to fix the date when I sent it, but on the 18th of January I received a letter from Mr. Hubbard expressing his satisfaction with it, and it must have been returned to me then, or immediately after, as I made oath to it in Boston, on the 20th of January, 1876, and sent it back to Mr. Hubbard. The reason why it was not filed immediately was that it was deemed important that I should meet Mr. Pollok and go over it with care. We met in New York shortly after and spent a day in considering the specification. No change whatever was made in it, and Mr. Pollok took it back with him and filed it in the patent office on his return."

Mr. Bell had already spent many weeks in the careful study and preparation of this specification; we quote again his statements of the especial care he used in this matter:

"I wrote and rewrote the specification a number of times and finally adopted that mode of expression that seemed to me best to explain my invention and the relation that one part of it bore to another." (C. Vol. 2, page 1620, Ans. 394).

"It will be understood, then, that in October, 1875, I was placed in a very serious dilemma. I expected from day to day to hear from Mr. George Brown, and, while waiting, I occupied myself in writing and rewriting my specification. I felt that I had made a great invention; that I had invented what is now known as 'the speaking telephone.' I tried to embody this in my specification and to express it in language that should be scientifically accurate and complete, and to the best of my ability I did so." (C. Vol. 2, page 1678, Ans. 563.)

We are now confronted by an extraordinary fact. Mr. Bell had labored for weeks, to the best of his ability, to perfect his specification and to make it "scientifically accurate and complete" in expression. Subsequently to the final completion and verification of that specification, Mr. Bell and Mr. Pollok, his attorney, had passed a day together in New York in its careful examination, a day devoted especially to that work.

Yet, notwithstanding all this extraordinary care and diligent study, the specification appears in the Patent Office containing such obvious inaccuracies of expression, such inconsistencies and such a lack of complete definitions, that the amendment formally made was rendered absolutely necessary to properly complete the specification. There was certainly no lack of ability or discernment in Mr. Bell or Mr. Pollok, for they were the ones who saw the obvious necessity for the amendment, and made it and filed it in the Patent Office.

We are startled by this extraordinary phenomenon. But the more we study the matter, the more the mystery grows. The "George Brown specification" was, indeed, complete and "scientifically accurate" in all its expressions. It was consistent with itself in every part, and was indeed a model specification.

Again, all the difficulties cluster about this new passage interjected into the specification. It does not *fit* into the place. It is foreign to its environment. It is not in accord with the great theory elaborated with such careful detail in the body of the specification. Other expressions have to be modified to soften their antagonism.

Further, it is not only isolate and alien to the rest of the patent, but it is inconsistent with the purpose outlined by Mr. Bell in his letter of August 14th, to patent "the use of the magneto-electric current." The key no longer fits the tumblers of the lock.

Still further, it is absolutely disconnected from the brilliant conception which had its first inception in the summer of 1874, and which Mr. Bell, during the succeeding months had elaborated with such care, which led to the intense labors of June and July, 1875, and which finally found its consummation and perfect expression in the "George Brown specification."

What is the explanation?

How came about such an anomaly as is here presented?

One is naturally and inevitably led to make the inquiry, What were the circumstances which occasioned such a diversion? How came a man of Mr. Bell's exceptional and proved abilities to insert the passage in the specification in such a bungling manner?

We turn to the record and ask Mr. Bell what were these circumstances?

Our only answer is, *Silence.*

Mr. Bell has given us at length all the details, even to the chain of reasoning he employed, in the development of his idea of the use of the magneto-electric current, but now, not a thought or a circumstance is mentioned by Mr. Bell in explanation of the origin of this passage, or even of the extraordinary statement that "the more deeply the conducting wire is immersed in the *mercury*," "the less resistance does the liquid offer to the passage of the current." All is left shrouded in the silence of mystery.

The mind can not rest content under such circumstances, but must probe the matter to the very depths, if possible.

We turn to other sources of information contained in the record, seeking for any and every circumstance that may possibly throw any light upon the subject. We find at once an account of the occurrence of an incident of such a remarkable character as to immediately arrest our attention; we perceive the possibility of its having a bearing directly upon the subject of our investigation.

It appears by reference to the certified copy of the file wrapper and contents of Mr. Bell's patent (C. Vol. 4, page 14), that on the same February 14th that Mr. Bell's original application was filed in the patent office, Mr. Elisha Gray, of Chicago, filed in that office the following caveat:

"UNITED STATES PATENT OFFICE.

ELISHA GRAY, OF CHICAGO, ILLINOIS, TRANSMITTING VOCAL SOUNDS TELEGRAPHICALLY.

GRAY'S CAVEAT.

Filed February 14, 1876.

TO ALL WHOM IT MAY CONCERN:

"Be it known that I, *Elisha Gray*, of Chicago, in the county of Cook, and State of Illinois, have invented a new *Art of transmitting vocal sounds telegraphically*, of which the following is a specification:

"It is the object of my invention to transmit the tones of the human voice through a telegraphic circuit, and reproduce them at the receiving end of the line, so that actual conversations can be carried on by persons at long distances apart.

"I have invented and patented methods of transmitting musical impressions or sounds telegraphically, and my present invention is based upon a modification of the principle of said invention, which is set forth and described in *Letters-Patent* of the United States, granted to me July 27, 1875, respectively numbered 166,095 and 166,096, and also in an application for Letters-Patent of the United States, filed by me February 23, 1875.

"To attain the objects of my invention, I devised an instrument capable of vibrating responsively to all the tones of the human voice, and by which they are rendered audible.

"In the accompanying drawings I have shown an apparatus embodying my improvement, in the best way now known to me, but I contemplate various other applications, and also changes in the details of construction of the apparatus, some of which would obviously suggest themselves to a skillful electrician, or a person versed in the science of acoustics, on seeing this application.

"Figure 1, represents a vertical central section through the transmitting instrument;

ELISHA GRAY

"Figure 2, a similar section through the receiver; and

"Figure 3, a diagram representing the whole apparatus.

"My present belief is, that the most effective method of providing an apparatus capable of responding to the various tones of the human voice, is a tympanum, drum or diaphragm, stretched across one end of the chamber, carrying an apparatus for producing fluctuations in the potential of the electric current, and consequently varying its power.

"In the drawings, the person transmitting sounds is shown as taking into a box or chamber, A, across the outer end of which is stretched a diaphragm (a) of some thin substance, such as parchment or gold beaters' skin, capable of responding to all the vibrations of the human voice, whether simple or complex. Attached to this diaphragm is a light metal rod A^1 or other suitable conductor of electricity, which extends into a vessel B, made of glass or other insulating material, having its lower end closed by a plug, which may be of metal, or through which passes a conductor b, forming part of the circuit.

"This vessel is filled with some liquid possessing high resistance, such, for instance, as water, so that the vibrations of the plunger or rod A^1, which does not quite touch the conductor b, will cause variations in resistance, and, consequently, in the potential of the current passing through the rod A^1.

"Owing to this construction, the resistance varies constantly, in response to the vibrations of the diaphragm, which although irregular, not only in their amplitude but in rapidity, are nevertheless transmitted, and can, consequently, be transmitted through a single rod, which could not be done with a positive make or break of the circuit employed, or where contact points are used.

"I contemplate, however, the use of a series of diaphragms in a common vocalizing chamber, each diaphragm carrying an independent rod, and responding to a vibration of different rapidity and intensity; in which case contact points mounted on other diaphragms may be employed.

"The vibrations thus imparted are transmitted through an electric circuit to the receiving station, in which circuit is included an electro-magnet of ordinary construction, acting upon a diaphragm to which is attached a piece of soft iron, and which diaphragm is stretched across a receiving vocalizing chamber *a*, somewhat similar to the corresponding vocalizing chamber A.

"The diaphragm at the receiving end of the line is thus thrown into vibration corresponding with those at the transmitting end, and audible sounds or words are produced.

"The obvious practical application of my improvement will be to enable persons at a distance to converse with each other through a telegraphic circuit, just as they now do in each other's presence, or through a speaking tube.

"I claim, as my invention, the art of transmitting vocal sounds or conversations telegraphically through an electric circuit.!

"ELISHA GRAY.

"Witnesses:
"WILLIAM J. PEYTON,
"WILLIAM D. BALDWIN."

We find in this caveat a clear statement of a proposed use of a current of varying power for the transmission of vocal sounds and speech. A method of varying the power of the current by varying the resistance in the circuit, is distinctly described, and, in particular, the mode of operating by immersing the conducting rod in a liquid of high resistance, is definitely set forth.

"This vessel is filled with some liquid possessing high resistance—such, for instance, as water—so that the vibrations of the plunger or rod A^1, which does not quite touch the conductor *b*, will cause variations in resistance, and, consequently, in the potential of the current passing through the rod A^1.

The similarity of the ideas expressed, respectively, in the caveat and in the new passage interjected into Mr. Bell's specification, is perfectly plain.

The bearing of the one paper upon the origin of the other is sufficiently evident, if only it be shown that they were actually brought into connection. *If* the contents of this caveat had been brought to the knowledge of Mr. Bell or his attorney; if this knowledge had been gained in seasonable time and under such circumstances as to permit of the surreptitious insertion of the new passage in the specification; and finally, if Mr. Bell and his attorney were dishonorable enough to perpetrate such a fraud upon Mr. Gray and the public—if all this were true, then the mystery would be cleared up, and we would have in our possession a complete and adequate explanation of the presence of this passage in the specification, and one entirely consistent with every circumstance we have already mentioned.

Such a solution of the enigma, however, involves an imputation upon Mr. Bell of such rascality, and of the actual perpetration of a fraud so wicked, so monstrous, and so far-reaching in its disastrous consequences, that its very statement creates a shudder of horror and aversion.

And yet, in all solemnity and with a due sense of the awful responsibility involved in making the charge, we here state to the court that a careful examination of the facts disclosed in complainant's own record has forced upon us the absolute conviction that this new passage was surreptitiously inserted in the specification *after* it was filed in the patent office, and *after* Mr. Bell's attorney, Mr. Pollok, had gained a knowledge of the contents of Mr. Gray's caveat. In plain Anglo-Saxon, we are convinced that Mr. Bell *stole* this from Mr. Gray.

XX.

It is plainly our duty to present to the court for its information the facts established in the record, which have produced in us this conviction. In the orderly development of the subject, the first great *fact*, startling in its significance, is the established existence in those days of a conspiracy between Mr. Bell, Mr. Pollok, his attorney, and the Examiner in the Patent Office, in the class of electricity, to illegally and illegitimately promote Mr. Bell's patent interests at the expense of Mr. Gray's, and in direct violation of the requirements of secrecy established for the protection of all inventors.

The public, for some reason, has long suspected the existence of this conspiracy, and the executive department of the government has even taken steps to ferret it out. We should hardly expect, however, to find any evidence of it in this case, and least of all, in complainants own record.

But to our astonishment, we find here a narrative, written over Mr. Bell's own signature, giving, in circumstantial detail, the *modus operandi* followed by these conspirators in the prosecution of their nefarious plot against Mr. Gray and his interests.

But first, let us consider for a brief moment the pose Mr. Bell has assumed throughout the whole case as the very personification of high-toned, super-sensitive conscientiousness.

In his preliminary statement in Harmonic Interferences, sworn to May 8, 1876, Mr. Bell inserted the following passage:

"It was just at this time (September or October, 1874,) that I first heard of Mr. Elisha Gray. I received a note from my friend Dr. Clarence J. Blake, in which he alluded to a letter received from Mr. Elisha Gray, descriptive of experiments made with Prof. Tyndall, relative to the telegraphic transmission of vocal sounds. Dr. Blake stated his desire to show me the letter, and expressed his wish to have me meet Mr. Gray. I called upon Dr. Blake next day, and told him that as I was at that time applying for a caveat for an invention which would ultimately lead to the telephonic transmission of vocal sounds, I thought it might be well for me to be ignorant of Mr. Gray's researches until I had secured my patents. For this reason I did not see the letter, and I am still ignorant of its contents."

Again in 1879, Mr. Bell testified in the *Dowd* case as follows (C. Vol. 1, page 123):

"Int. 51. You say that this first conversation on this subject with Dr. Blake was soon after the 21st of October, 1874; how do you fix that date? Ans. By reference to a letter that I received from him dated Oct. 21, 1874, in which he referred to some letter that he had received from Mr. Elisha Gray, concerning experiments in telegraphing 'vocal' sounds. [I visited Dr. Blake within a day or two after receiving his letter, and told him I did not wish to see Elisha Gray's letter, as I was then engaged upon the problem of the transmission of articulate speech by electricity, and did not wish to be indebted to any one for information upon the subject.]"

Again (C. Vol. 1, page 170):

"Int. 171. In your fifty-first answer, you referred to a letter which you received from Dr. Clarence J. Blake, dated Oct. 21, 1874, in which he referred to a letter from Mr. Elisha Gray; have you since seen that letter of Mr. Elisha Gray to Dr. Blake, and where is it now? Ans. I have. Dr. Blake produced the letter as a part of his deposition in the harmonic telegraphic interference case between Mr. Elisha Gray and myself, and a copy of it is to be found at page 121 of the printed evidence in that case.

"Int. 172. Does that letter from Mr. Gray make any reference whatever to the transmission of vocal sound, or make any statements as to the character of Mr. Gray's inventions, experiments or apparatus? Ans. It does not."

And again, upon his cross-examination in 1883, (C. Vol. 2, page 1603, Ans. 344,) Mr. Bell added to his answer the following statement:

"The fact of an explanation of a speaking telephone having been given to Dr. Blake in October, 1874, is impressed upon my memory by the fact that this explanation was the result of a letter I had received from him, dated October 21, 1874, (printed on page 342 of complainant's record,) in which he used the following remarkable expression which at once riveted my attention, 'I have received a letter from the Royal Institute from Elisha Gray concerning his experiments in telegraphing vocal sounds which you will be glad to see.'

"My fears were at once aroused. I was afraid that some one else was at work upon the speaking telephone. I visited Dr. Blake within a few days of the receipt of his letter, not for the purpose of learning what Mr. Gray or any one else had done in this line, but, 1. For the purpose of describing to him the method and apparatus that I had devised for the reproduction of articulate speech by electrical means. 2. And for the purpose of seeking his advice concerning the operation of the membrane telephone I had devised, as he was a scientific man of eminence who had devoted much time and thought to acoustical subjects, and especially to the subject of the vibration of loaded membranes like that of the human ear and in the Scott Phonautograph. I remember very distinctly that these were the objects with which I visited Dr. Blake, and I remember also that I refused to see the letter from Mr. Elisha Gray in spite of Dr. Blake's assurance that it had nothing to do with vocal sounds."

This public parade of Mr. Bell's solicitude to remain in ignorance of his rival's labors cost nothing, for Dr. Blake assured him at the time that the letter "had nothing to do with vocal sounds."

But later on there was something at stake, and then, in the privacy of the home circle, and in a gushing letter written to his parents, Mr. Bell reveals an altogether different character.

This letter reads as follows: (C. Vol. 4, page 969):

"SALEM TO BOSTON, March 5, 1875.

DEAR PAPA AND MAMA:

Please let me hear from you soon. Let me hear all the news. I have been working day and night in Washington, so that I have been unable to see the sights as yet. Everything looks most promising. One of the first things I did on reaching Washington was to set up my apparatus so as to make four stations, A, B, C, D. My

wish was to illustrate that a message could be sent from B to C at the same time that a message passed from A to D.

I had four cells of a battery, but no acids. In order to have plenty of battery power that the thing might work well enough, I wished six cells and a mixture of bichromate of potash with some acid (I forgot what).

There was only one electrician in town, and I went to him for everything, unfortunately giving my name.

He sent me down two cells of Lockwood's battery, and I was surprised that the young man who brought them came right into the parlor and stared about, to see what kinds of instruments I had got.

Still further was I surprised to find that the two cells he brought would not work.

The young man came back with the bi-chromate for the other cells, but I had my suspicions aroused, and did not use the solution.

To add to my distress Mr. Hubbard informed me that Mr. Orton (the president of the Western Union Telegraph Company) would be round in half an hour to see my instruments.

The Western Union is probably the largest corporate body that has ever existed.

It controls more miles of telegraph wire than there are in the whole of Europe. It was, therefore, important to have my instruments in good shape. I did my best by getting nitric acid and sulphuric acid to get the cells I had in working order. I sawed a large carbon in two, borrowed a couple of slop-basins, and had the whole in working order just *half a minute* before Mr. Orton made his appearance. The instruments, by good luck, never worked better. Mr. Orton was very much interested, and said he would like to see me again, but had to go to New York that night.

Two days afterward I was in the Capitol seeing the Senate, when a gentleman came up and tapped me on the shoulder. It was Mr. Orton. He told me that the Western Union would be glad to give me every facility in perfecting my instruments, and he gave me a hearty invitation to take apparatus to New York, and I should have the assistance of their best electricians.

They have a special experimental room, and have at instant command thousands of cells of battery, and thousands of miles of real line wire to test with.

Mr. Orton said further, that he wished me distinctly to understand that the Western Union had no interest in Mr. Gray or his invention.

This is very encouraging. Mr. Orton had *previously* seen Gray's apparatus, and yet he came forward to take up mine.

In regard to the patents: My lawyers, Pollok and Bailey, found on examination at the patent office, that I had developed the idea so much further than Gray had done, that they have applied for *three distinct patents*, in only one of which I come into collision with Gray.

The first patent covers the principle "Multiple Telegraphy," basing my claim upon the instruments exhibited. (These instruments require two lines, an up-line and a down-line.)

The second patent covers the principle of using an *induced current*, so as to permit a single wire to be employed.

The third patent is for a "vibratory circuit breaker," for the purpose of converting the vibratory motion of my receiving instrument into a permanent *make* or *break* of a local circuit.

By this arrangement I can make a receiver work *any instrument whatever* that can be moved by electro-magnetism, and it is developed into a very curious form of "Autograph Telegraph," by means of which an autograph message or picture may be almost instantly copied. The copy is made in ordinary ink and on ordinary paper.

My lawyers were at first doubtful whether the examiners would declare an interference between me and Gray, as Gray's apparatus had been there for so long a time.

They feared I had but a poor chance, and my spirits at once fell to zero. They said it would be difficult to convince them that I had not copied. When, however, they saw the "Autograph Telegraph" developed from the idea of multiple telegraphy, they at once said that was a good proof of independent invention, as Gray had no such idea. It further turned out that an examiner in the patent office (not, however, of electrical inventions) is a deaf mute, and knows me personally and by reputation, and could surely vouch for the fact of my being incapable of copying Gray.

Another fortunate circumstance was this. That the very examiner into whose hands this will come, happened to be in Mr. Pollok's office one day when I called, so that I had a long interview with him, in which I explained everything to him, and I can't help thinking that he must have been convinced of my independent conception of the whole thing.

After making out our specifications and examining into the whole thing, Mr. Pollock said, "You have a good case." The last words he said when I left were, "You need not fear; we shall pull you through all right."

Whenever Gray's lawyer heard that I was in town he applied to the patent office to complete Gray's patent, and thus force me to a law suit.

The examiners, however, could not act in the matter for ten days, so that gave me time to get my application in in time. I am now waiting for the decision of the examining board. They will probably declare an interference. Then I shall have to have witnesses examined and prove priority.

The invention could not have come out at any better time than the present. I shall explain how.

There are two rival telegraph companies in America: The Western Union and the "Pacific Line."

The Western Union have hitherto enjoyed a monopoly. But last year a man invented a method of sending *four messages simultaneously* along the same wire, and the Pacific Telegraph Company bought his patent for seven hundred and fifty thousand dollars ($750,000).

"The result has been that the Pacific Company has been able to reduce their prices so as to compete successfully with the Western Union.

"Now my invention comes out as a means by which thirty or forty messages may be sent simultaneously, and by which intermediate stations may communicate with one another. If the Western Union take it up it would enable them to recover lost ground. At all events it is evidently a good time to bring out the invention. I visited the Western Union Telegraph headquarters in New York on my way here. I have made arrangements to spend Saturday and Sunday every week in New York at the West. Un. building.

"I am to have the assistance of Mr Prescott (the author of the book you have on telegraphy), so now I feel that all is plain sailing if I can prove priority.

"Here is Boston. Much love.

"Aleck."

Now it appears from the official records of the Government, published with the Annual Reports of the Commissions of Patents, and also from the Official Gazette of the Patent Office, that, at that time, *no patent whatever* had ever been granted to Mr. Gray relating in any manner to multiple telegraphs, and that no patent of any description had then been granted to Mr. Gray after 1872.

The following recitals are contained in Mr. Gray's later patents as they appear in the record:

"Improvement in electric telegraphy for transmitting musical tones.

"Specification forming part of Letters Patent No. 166,096, dated July 27, 1875; application filed January 19, 1875." (Overland Case, Vol. 3, page 131.)

"Improvement in electric telegraphs for transmitting musical tones. Specification forming part of Letters Patent No. 166,095, dated July 27, 1875; application filed Jan 19, 1875." (*Ibid.*, page 139.)

The application filed by Mr. Gray, February 23, 1875, remains still in interference.

It is therefore demonstrably certain that the "examination at the patent office" made by Pollok and Bailey was not a legitimate examination of Mr. Gray's patents, but an illegitimate and illegal examination of the contents of Mr. Gray's pending *applications*. Indeed, this is made sufficiently clear from the context of the letter, without rendering it at all necessary to refer to the official records.

Notice, for a moment, the remarkable character of the information thus acquired by Mr. Bell and his attorneys as to the contents of Mr. Gray's applications.

"My lawyers, Pollok and Bailey, found on examination at the patent office, that I had developed the idea *so much further than Gray had done*."

Their facilities in the office were such that they had been able to make a comparison between the development made by Mr. Bell, and that unfolded by Mr. Gray, and this too, before Mr. Bell had filed any application. They were thus enabled to plan in advance how to secure to Mr. Bell important advantages over his rival. They would divide up his work into three distinct applications, and in such a way as to leave only one tied up in conflict with Mr. Gray's, while the other two could be rushed through the office.

This, as we all know, would secure to Mr. Bell a great advantage, especially in the negotiations with Mr. Orton and the Western Union, where Mr. Gray was also his rival. Again, how did Mr. Bell's lawyers ascertain that Gray's apparatus had been there for so long a time?

How did they ascertain from their examination that "Gray had no such idea" as the "Autograph Telegraph?"

The most intimate relations are established with the examiner. He kindly comes to Mr. Pollok's office and canvasses the whole subject with Mr. Bell.

This intimacy bears its appropriate fruit: "Whenever Gray's lawyer heard that I was in town he applied to the patent office to complete Gray's patent, and thus force me to a law suit. The examiners, however, could not act in the matter for ten days, so that gave me time to get my application in in time." By reference to the preliminary statement in the subsequent interference (C. Vol. IV, page 990), it will be seen that Mr. Bell's new application was filed February 25, 1875, which was pretty quick work under the circumstances.

Mr. Bell and his attorney certainly had very prompt information of every move made by Mr. Gray in the patent office.

Is any further evidence necessary to convince us of the existence of this conspiracy between the parties, when we have before us this detailed narrative of their proceedings in direct fraud upon Mr. Gray?

Were there a mass of testimony, it could only be cumulative in its character. The *fact* is sufficiently proved by the "silent evidence" of Mr. Bell's own letter written at this time.

Moreover, reading between the lines of this letter, we are afforded a glimpse of Mr. Bell's real character. His moral sense was so dull and blunted that he seemingly had no adequate appreciation of the wickedness of the proceedings in which he was participating. He actually gloried in his shame.

We can no longer doubt Mr. Bell's capacity or his willingness to participate in the perpetration of another fraud of like character upon Mr. Gray, whenever the opportunity should occur:

Again, the fact of the consummation of this original fraud upon Mr. Gray was itself a moral, or rather immoral force, binding the conspirators together in closer bonds, perpetuating the conspiracy, and continuing its operations as long as the rivalry between Mr. Gray and Mr. Bell should last.

On February 14, 1876, Mr. Bell's new application and Mr. Gray's caveat were filed together in the patent office. Should it subsequently appear that, as matter of fact, Mr. Bell's application did not then contain the passage in controversy, it would not only be manifest, but the mind would be convinced "beyond a reasonable doubt," that that passage was surreptitiously inserted, through the operation of the same conspiracy, whose existence has already been established.

Astonishing as it may appear, a close analysis of Mr. Bell's own testimony, together with that of Mr. Gardner G. Hubbard, reveals the *fact* that when this specification was filed it did *not* contain that passage.

XXI.

The following is a history of the preparation of Mr. Bell's specification as digested from the testimony in complainant's record.

It was commenced in Canada, in September, 1875.

"I commenced the draft of the specification for my patent involved in this interference while I was in Canada. * * * I returned to Boston early in October." (Bell's Prelim. Stat. Speak. Telep. Interference, C. Vol. 4, p. 1010.)

"*Int.* 101. When did you begin to prepare the specification for your patent No. 174, 465, of March 7, 1876? *Ans.* During the month of September, 1875, in Canada, and I continued it in Boston when I returned, during the early part of October." (Bell C. Vol. 1, page 152.)

"*Q.* 562. It has already appeared that you passed the month of September, 1875, in Canada, at your father's; please state what occupied your time during that month, and what attention you devoted to any electrical matters. *Ans.* I went to Canada chiefly for the sake of my health. I spent a great portion of my time (as I remember after reading the notes in my father's diary) in the open air, taking plenty of horseback exercise. I had no means of making electrical experiments, but I attempted, as I found strength and inclination, to reduce to writing my ideas concerning the production and utilization of undulatory currents for the purposes of the speaking telephone and the multiple telegraph. I also occupied a portion of my time in trying to interest friends in my inventions. I hoped to make some pecuniary arrangement for my support in Boston, so that upon my return to that city I might devote all my time to my electrical researches. It was my intention to patent what I had done at once, in the United States and abroad, and I thought that in return for an interest in my foreign patents I could induce some friend to make the arrangement I desired, and to undertake all the expense of the foreign applications.

"Before I left Canada, I had arrived at an understanding of this kind with the late Hon. George Brown, of Toronto, and his brother, Mr. Gordon Brown. (C. Vol. 2, page 1675, Bell.) For the first visit (to Canada referred to in the question) I went on or about September 1, 1875, and arrived in Salem on my return on or about October, 1, (Cross-Q. 536,

C. Vol. 2, page 1667.)" The specification was mainly written in October, 1875.

"I returned to Boston early in October, and resumed work on my specification with a view to placing it in the hands of Mr. Brown in case of his accepting my proposition. I delayed making out an application for a patent in this country, though repeatedly urged to do so by Mr. Hubbard, in order to make some arrangement with Mr. Brown, or some other person, to take out foreign patents. I heard nothing from Mr. Brown until my visit to Canada at Christmas, 1875." (Prelim. Stat. C. Vol. 4, page 1010.)

"Immediately upon my return to Salem, in October, 1875, I prepared the specification for my patent of March 7, 1876, so as to be ready to make application for letters patent in the United States and abroad, the moment a definite arrangement should be concluded with Mr. George Brown and his brother.

"Mr. George Brown had specially requested me to take no steps in America that could be prejudicial to the patents he proposed to take out abroad. I therefore waited anxiously for the definite reply to my proposition that had been promised, but it never came. * * * It will be understood, then, that in October, 1875, I was placed in a very serious dilemma. I expected from day to day to hear from Mr. George Brown, and while waiting I occupied myself in writing and re-writing my specification. I felt that I had made a great invention; that I had invented what is now known as 'the speaking telephone.' I tried to embody this in my specification, and to express it in language that should be scientifically accurate and complete, and to the best of my ability I did so. I did not know much about the patent laws of the country, but believed that the counsel who might be employed by Mr. George Brown and his brother, or Mr. Sanders and Mr. Hubbard, would make the necessary alterations in the phraseology, if any such alterations were deemed necessary. Mr. Hubbard and Mr. Sanders were very anxious to have my specifications filed at once in the United States patent office, but I believed the invention to be so important and so valuable that I wanted it to be taken out abroad, as well as in America, and, therefore, delayed the filing, hoping to hear from Mr. George Brown and his brother." (Cross-Q. 563, C. Vol. 2, page 1676.)

"I saw the specification of the speaking telephone in October, 1875. I believe it was substantially like the one for which the letters patent were issued, though several changes were made in it subsequently to my first seeing it." (Dep. of Gardner Hubbard, C. Vol. 4, page 960.)

The specification was taken to Washington in the first of December, 1875, shown to Mr. Pollok by Mr. Hubbard, brought back by him Dec. 14th or 15th, and then taken back to Washington, January 10, 1876, shown to Mr. Pollok, and again returned to Mr. Bell for his signature and oath, January 18, 1876, and signed and sworn to January 20, 1876.

"I believe I took it with me to Washington in the first of December, 1875. I showed it to Mr. Pollok, brought it back with me on leaving Washington, Dec. 14 or 15, then took it with me on my return to Washington, which was, I think, on the 10th of January, 1876; showed again to Mr. Pollok, then I returned it to Mr. Bell for his signature and oath."

(Deposition of Gardiner Hubbard. Int. 20, C. Vol. 4, page 960.)

Int. 114. Was a specification prepared from these drafts for Mr. G. G. Hubbard to take to Washington and have examined by Mr. Pollok, your patent solicitor? *Ans.* It was.

Int. 115. Did you learn from Mr. Hubbard at any time that Mr. Pollok had examined this specification with him, and found it satisfactory, and if so, when did you learn this? If you have any means of fixing the date with precision, please state what means you have. *Ans.* I heard from Mr. Hubbard to this effect upon the 18th day of January, 1876. I fix this date by reference to a letter that I wrote to Mr. Hubbard's daughter on the 18th of January, 1876, in which the following passage occurs:

"I received a nice letter from your father this morning, in which he says how well pleased he is with the new specification, and that it promises to be of great value if I *prosecute my researches diligently*, if not, others may supplant me. He says, 'I have been over your specification with Mr. Pollok. He is very much pleased with it, and says he does not think it will require any alteration.'"

Int. 116. Have you in your possession the letter from Mr. Hubbard referred to in your last answer? *Ans.* I have not.

Int. 117. Have you made careful search for it? *Ans.* I have, but have been unable to find it.

Int. 118. What day of the week was the 18th of January, 1876? *Ans.* It appears by the calendar that it was Tuesday.

Int. 119. Please state when, if ever, you received from Mr. Pollok's office a fair copy of the specification to be signed and sworn to; and if you have any means of fixing the date, please produce it. *Ans.* I received a fair copy of the specification from Mr. Pollok's office either on the nineteenth or twentieth day of January, 1876, and I took oath to it in Boston on the twentieth of January, 1876. I fix the date of receiving it by a memorandum which has been given me, which I am informed and believe is a press copy of Mr. Pollok's letter to me accompanying the specification. It is as follows:

"January 18, 1876.

"Mr. A. Graham Bell:

"*Dear Sir:*—Herewith find applic. papers, &c., for your new improvements in telegraphy. We have left blank for title of invention in the oath, which you can fill in.

"Please execute the papers as indicated in pencil, and return them to me.

"Very truly yours."

Int. 120. Have you got the original of the letter just read? *Ans.* I have not.

Int. 121. Do you know where it is? *Ans.* I do not.

Int. 122. In whose handwriting was the fair copy of the specification which was sent to you from Washington, as you stated? *Ans.* I do not know. It was in a strange handwriting. I presume it was written by some of Mr. Pollok's clerks.

Int. 123. Please look at the certified copy of the specification now shown you, and state when and where the *jurat* is dated. *Ans.* Suffolk county, State of Massachusetts, the 20th of January, 1876.

Int. 124. It appears from this certified copy that this application was filed in the patent office Feb. 14, 1876: why was it not filed sooner? *Ans.* I had made arrangements to have the specification filed simultaneously in England and the United States, and delayed making the application in the United States patent office in the expectation of receiving a cablegram from England informing me when to file it."

[*Complainants put in evidence a certified copy of file wrapper and contents of Bell patent of March 7, 1876, marked "Complainants' Exhibit 24, Bell's Application of 1876."*]

Int. 125. Please look at the paper now shown you; state who made it. *Ans.* I did.

Int. 126. When and where and for what purpose? *Ans.* I made it at the Queen's Hotel, Toronto, on the 28th day of December, 1875, for the information of the Hon. George Brown.

Int. 127. What occasion had you to give him information on the matters shown in that paper? *Ans.* I expected to conclude arrangements for having him take out patents in England for me and made this drawing to illustrate certain of my inventions.

Int. 128. Is that the same Mr. George Brown spoken of in your letter to Mr. Hubbard of September 28, 1875, which was read as a part of your one-hundredth answer? *Ans.* It is.

Int. 129. State generally what inventions or what apparatus that paper shows. *Ans.* The invention and apparatus described in my United States patent, dated March 7, 1876.

Int. 130. There appears to be a memorandum on the back of it not in your handwriting: who wrote that? *Ans.* The Mr. George Brown referred to.

Int. 131. In whose possession did you leave it after you made it, and when did you next see it? *Ans.* I left it in the possession of the Hon. George Brown, in Toronto, on the twenty-ninth day of December, 1875, and I next saw it in Toronto on the 12th of November, 1878, and requested Mr. Brown to intrust it to Mr. Thomas A. Watson who brought it on to Boston.

Complainants put in evidence the paper referred to, and it is marked "Complainants' Exhibit 25, Bell's Toronto drawing, W. P. Preble, jr., Examiner." (Original No. 37.) (Deposition of Alex. Graham Bell, C. Vol. 1, page 156.)

"*Cross-Q.* 495. Were the drawings of your patent of March 7, 1876, made before or after December 28, 1875? *Ans.* The original sketches, of which the drawings in the patent are copies, were made before that time. I do not know when the draughtsman's drawings were made, except that it was between the middle of December, 1875, and the middle of January, 1876."

(Bell, C. Vol. 2, page 1658.)

"Towards the end of November the expostulations of Mr. Hubbard and Mr. Sanders had their effect; we would no longer wait for Mr. Brown. In the early part of December Mr. Hubbard took my specification to Washington to have it submitted to his counsel there; but at my earnest request he promised that no steps should be taken in the United States patent office until I had had a last chance to interest friends in Canada, so as to have my foreign patents taken out simultaneously with my American patent. On account of the nature of my engagements this opportunity would not arrive until the Christmas vacation." * * *

"In the mean time, as I have stated above, it was my intention to make another attempt, during the Christmas vacation, to interest friends in Canada to take out our foreign patents. I accordingly left Salem for Canada on or about the 24th day of December, and returned about the 1st of January, having in the meantime concluded a definite agreement with Mr. George Brown and his brother. I could not, at that time, ask them for a cash payment sufficient to support me, as I was then carrying out the organization of my professional work in the manner stated above. I asked them, however, and they agreed to make a sufficient allowance to pay the rent of special rooms in which the experiments might be carried on, as I had been much troubled by reports among the workmen in Mr. Charles Williams' workshop, that strangers had been observing my apparatus and had apparently been making notes. In consequence of this arrangement I took rooms in Exeter Place, Boston, to which the apparatus in Mr. Williams' workshop was removed somewhere during January, 1876.

"My recollection is, that at this time also I intrusted the education of the little deaf pupil, to whom I have so often alluded, to one of my normal teachers, and came to Boston to live, thus saving a considerable portion of my time. In consequence of the agreement with Mr. Brown and his brother, my specification was returned to me from Washington, to be sworn to in Boston, and I was much pleased to observe that it had not been found necessary to alter the phraseology."

(Bell, C. Vol. 2, page 1678.)

"I completed the specification for my American patent early in January, and sent it to Mr. Hubbard, in Washington, to be examined by Mr. Pollok. I am not able to fix the date when I sent it, but on the 18th of January I received a letter from Mr. Hubbard expressing his satisfaction with it, and it must have been returned to me then, or immediately after, as I made oath to it in Boston on the

20th of January, 1876, and sent it back to Mr. Hubbard."

(Prel. Stat. C. Vol. 4, page 1010.)

The specification having been signed and verified, it was returned to Washington. Subsequently Mr. Pollok met Mr. Bell in New York, and spent a day considering it with care, returned with it to Washington and filed it in the patent office on his return.

"I made oath to it in Boston on the 20th of January, 1876, and sent it back to Mr. Hubbard. The reason why it was not filed immediately was, that it was deemed important that I meet Mr. Pollok and go over it with care. We met in New York shortly after and spent a day in considering the specification. No change whatever was made in it, and Mr. Pollok took it back with him and filed it in the patent office on his return."

(Prel. Stat. C. Vol. 4, page 1010.)

"My application was not filed before this date in consequence of a promise that I had made to Mr. George Brown, who had then gone to England, that the American application should not be filed until a cablegram had been received from him, telling me that I might do so without prejudice to the foreign applications. I returned my specification to Washington, either to Mr. Hubbard or to Messrs. Pollok and Bailey, immediately after it was sworn to in Boston, January 20th, so as to be ready to be filed in the patent office upon telegraphic notice. I waited anxiously for the promised cablegram from Mr. Brown; but at last Mr. Hubbard became tired of waiting, and on the 14th of February the application was filed in the United States patent office without my knowledge."

(Bell, C. Vol. 2, page 1680.)

"Q. 566. In your letter to Mr. Elisha Gray, dated March 2, 1877, found in answer to cross-question 402, p. 1627, I find the following:

"My specification had been prepared *months* before it was filed, and a copy had been taken to England by a friend. I delayed the filing of the American patent until I could hear from him. At last the protests of all those interested in my invention, deprecating further delay, had their effect, and I filed my application without waiting for a conclusion of the negotiations in England."

"Does that paragraph refer to the withholding of the American application, which you have mentioned in your answer to interrogatory 563? Ans. It does."

(C. Vol. 2, pages 1680, 1682.)

Certain conclusions of fact are unequivocally established by the foregoing testimony, as follows:

Mr. Bell executed his contract with Mr. George Brown and brother at Toronto, December 29, 1875.

After his return from Canada, about January 1, 1876, he completed the specification for the American patent early in January, and Mr. Hubbard took it with him to Mr. Pollok at Washington, on or about January 10, 1876.

Upon the complainant's own showing, not an alteration or change was made in that specification, from the time that it left Mr. Bell's hands, on or about the 10th day of January, 1876, till it was filed in the patent office February 14, 1876.

Mr. Hubbard writes back to Mr. Bell from Washington, in a letter received January 18, 1876:

"I have been over your specification with Mr. Pollok. He is very much pleased with it, and says he does not think it will require any alteration."

Jan. 14, 1876, Mr. Pollok forwards to Mr. Bell "*a fair copy*" of the specification, written in a strange handwriting, presumably the work of one of Mr. Pollok's clerks. Mr. Bell received it and "is much pleased to observe that it had not been found necessary to alter the phraseology." He signs it and swears to it, and returns it, "immediately after it was sworn to in Boston January 20th."

Mr. Pollok and Mr. Bell then meet in New York, and spend a day in the careful consideration of the specification. No change whatever was made in it, and Mr. Pollok took it back with him and filed it in the patent office," and the record of these protestations is closed.

The fact is sufficiently established; but to complete the showing, the complainants have estopped themselves from denying it, by producing in the record, at the last moment, a photolithographic copy of the original application now on file in the patent office, and this shows a clear fair copy, without an erasure or an interlineation. This is exactly the condition in which was the specification when it was sworn to January 20, 1876.

In a word, the American specification was completed between January 1 and January 10, 1876, and suffered no change thereafter, until it was filed in the patent office, February 14, 1876.

It follows, as an inevitable conclusion, that if the controverted passage was in the specification at all before the latter was filed in the patent office, it had been inserted prior to January 10, 1876.

Another consequence is, that if this passage had in fact been inserted in the specification, its incongruities, its inconsistencies with other statements in the specification and the obvious necessity for some amendment escaped the repeated scrutiny of all the parties.

If the passage was there, it passed the ordeal of successive examinations, first, by Mr. Bell himself, when he inserted it; second, by Mr. Pollok, in Washington; third, by Mr. Bell, when he signed the specification and observed it so closely that he was enabled to state that there had been no change made in its phraseology; and finally, the close scrutiny of Mr. Bell and Mr. Pollok together, in New York, when they passed a day in its careful consideration.

Another significant fact is established by the testimony. Mr. Bell delivered the "George Brown specification" to Mr. Brown, just before the latter sailed upon his winter voyage to England.

This delivery was made during the last week in January, and on or about January 25, 1876.

"Q. 570. How long before Mr. George Brown sailed for England did you deliver this paper to him? Ans. I only know that it was handed to him between the date of the agreement, December 29, 1875, and the time he sailed,—the latter part of January, 1876," (Bell C. Vol. 2, page 1682.) The "George Brown specification" bore the following indorsement in Mr. Brown's handwriting:

"These papers were received by me from Professor Alex. G. Bell, in the winter of 1875–6, shortly before I left for England. I can fix the exact date by reference to my books and papers, but have not them at hand now.

GEORGE BROWN.

TORONTO, 12 November, 1878."

(C. Vol. 2, page 1689.)

"I met Mr. Bell in New York about January 25, at his request, to meet Mr. George Brown, of Toronto. We met Mr. Brown, and he agreed to take out letters patent in Great Britain. Mr. Bell gave me his copy of the specification, which I was to take under a promise, which he exacted from me, that it should not be filed at Washington until Mr. Brown should have filed it in England. He did not hear from Mr. Brown as he expected, and finally wrote to me [that if he did not hear by a certain day, that I might file it. I strenuously objected to the least delay, but it was of no avail, as he wished to have it taken out in his native country, that he might there have the benefit of what he believed a great invention.]"

(Gardiner G. Hubbard, C. Vol. 4, page 961, Int. 22.)

It further appears that the "George Brown specification" was originally prepared in October for use as an American specification.

"Q. 571. When was this paper written? Ans. In October, 1875.

"Q. 572. I observe that it is headed 'United States patent office,' from which I infer that this particular paper was originally prepared for your American specification, and not for the purpose of being handed to Mr. George Brown; what is the fact about that? Ans. Certainly, that is the fact." * (C. Vol. 2, page 1682.)

"Q. 576. In the Exhibit George Brown specification there are some alterations made by drawing the pen through words or phrases, and interlining others in place of them. What is your recollection as to when these changes were made? Ans. I have not any clear recollection of the time when these changes were made, excepting that they were made before the specification was given to Mr. Brown." (C. Vol. 2, p. 1683.)

"Q. 585. You have told me this morning that you wanted to make some addition to your answer to interrogatory 571; please do so. Ans. Yes; I desire to state that though from the language used in this paper I know that it is a copy of the specification as I wrote it in October, 1875, I can not be perfectly certain that the copy was itself made in October, 1875, although it is my belief that it was. It

---

* NOTE.—Possibly this is an explanation of why Mr. Bell only gave to Mr. Brown, of Toronto, Dec. 29, 1875, rough sketches of his invention. He either did not have this specification with him, or he could not spare it, or for some reason he preferred not to leave it with Mr. Brown at that time.

was made as a fair copy, not in my handwriting. The interlineations and corrections are in my handwriting." (C. Vol. 2, p. 1688.)

The facts are simple and clear. When Mr. Bell desisted from his labors upon the preparation of his specification at the end of October, or about that time, he had some one, presumably a clerk, write out "a fair copy" of his work for presentation in the United States Patent Office. This was the "George Brown specification."

On December 29, 1875, he executed the contract regarding the foreign patents with Mr. Brown, and on his return from Toronto about January 1, 1876, and between that time and January 10, 1876, he "completed" his specification for the American patent, and forwarded it to Washington; and from that time forth there was no change made in it until it was filed in the patent office, February 14, 1876.

It is demonstrably certain that after the "completion" of the American specification, the date of which is fixed, and either at that time or at some subsequent time, Mr. Bell compared the "George Brown specification" with it, and made certain erasures and interlineations therein (in his own handwriting) to make it conform to it. This is manifest from an inspection of the documents in C. Exhibit Vol. 4. pages 6 and 936. The "George Brown specification" is there printed in such a manner as to show both interlineations and erasures, the interlineations being printed in capitals and the erasures in brackets. Thus for example:

"That the difference between an undulatory and an intermittent current may be more clearly understood, I shall describe the condition of the electrical current when THE ATTEMPT IS MADE TO TRANSMIT two musical notes [of different pitch are] simultaneously [transmitted along the same wire] FIRST UPON THE ONE PLAN AND THEN UPON THE OTHER."

Every interlineation and every erasure that appears in the "George Brown specification" changes the tenor of the language where they occur so as to make it conform exactly to the language of *the original fair copy* of the American specification, as it is shown in the exhibit.*

The existing claims in the "George Brown specification" were struck out, and the new claims were inserted, except that the lengthy second claim was arranged in detail to conform to the English practice.

The "George Brown specification" was "handed" to Mr. Brown shortly before he left for England. Mr. Hubbard fixes the time and place of the interview of Mr. Brown, Mr. Bell and himself as at New York "about January 25."

It thus appears, that after the final completion of the American specification, and after the last change had been made in it, previous to its filing in the patent office, *fifteen days,* more or less, passed before Mr. Bell handed the "George Brown specification" to Mr. Brown. But this is not all, Mr. Hubbard, who then resided in Washington says:

"I met Mr. Bell in New York about January 25, at his request, to meet Mr. George Brown, of Toronto. We met Mr. Brown, and he agreed to take out letters patent in Great Britain, Mr. Bell gave me his copy of the specification, which I was to take under a promise, which he exacted from me, that it should not be filed at Washington until Mr. Brown should have filed it in England."

"He did not hear from Mr. Brown as he expected, and finally wrote to me [that if he did not hear by a certain day, that I might file it.'"] (C. Vol. 4, page 961.)

That copy of the specification which Mr. Bell then and there delivered to Mr. Hubbard to be filed at Washington was in a condition to be filed in the patent office. *It had previously been sworn to at Boston, January 20, 1876.*

But the language Mr. Hubbard unconsciously employed is even more significant than the obvious tenor of his words upon the surface. "Mr. Bell gave me *his* copy of the specification." Mr. Brown retained *his* copy and took it with him to England.

The presence at that interview with Mr. Brown of the verified fair copy of the American specification must be recognized as an established *fact*.

---

*NOTE.—The interlineations appearing also in the certified copy of the American specification will be considered hereafter, where they will appear as another link in the remarkable chain of circumstances existing in this case.

It is not impossible indeed that this was the very occasion when the attorney, Mr. Pollok, also met Mr. Bell in New York, and they spent a day going over the specification with care, and when "no change whatever was made in it."

Mr. Bell felt that he had made a great invention, that he had invented what is now known as "the Speaking Telephone." He was so anxious to secure this invention by foreign patents that he delayed the filing of the American specification for months to further this purpose. He even continued this perilous delay against the earnest expostula- of his partner, Mr. Hubbard.

"Mr. Hubbard and Mr. Sanders were very anxious to have my specifications filed at once in the United States Patent Office, but I believed the invention to be so important and so valuable that I wanted it to be taken out abroad as well as in America, and, therefore, delayed the filing, hoping to hear from Mr. George Brown and his brother. (C. Vol. 2, p. 1678).

Mr. Hubbard says:

"I strenuously objected to the least delay, but it was of no avail, as he wished to have it taken out in his native country, *that he might there have the benefit of what he believed a great invention.*" (C. Vol. 4, page 961.)

If Mr. Bell had at that time in mind an alternative method of creating his "undulatory" current, by varying the resistance upon the circuit; if he had embodied a description of that method in his American specification, describing various ways of varying the power of the current in the production of "electrical undulations,"—if this was the fact, it surpasses the bounds of human credulity to suppose, even for a moment, that he would have withheld a like description of this alternative method from his foreign applications, when he had such abundant opportunities to insert it.

Yea, more, it is absolutely incredible that he would have permitted to remain in the foreign specification, a clause which, in express terms, excluded this alternative method from the domain of the patent.

The "George Brown specification" contains the statement: "There are many ways of producing undulatory currents of electricity, *but all of them depend for effect upon the vibration or motion of bodies capable of inductive action.*"

He had only to draw his pen through the words, "but all of them depend for effect upon the vibration or motion of bodies capable of inductive action." In plain terms, Mr. Bell was either then a fool or subsequently a knave. His proved pre-eminent intellectual abilities, manifested in every detail of the previous history, absolutely forbid the existence of the first alternative and force us to the conviction of the truth of the second.

XXII.

Crime breeds crime. A foul deed perpetrated in silence and in secrecy draws around a man an invisible line that separates him from his fellows. He is thenceforth set apart as the especial victim of circumstances. He is arrayed in a never-ending but unequal conflict with the terrible Nemesis of retribution. The stern necessity is laid upon him of unceasing vigilance, of daring unscrupulousness, and of reckless effrontery in the commission of further offenses, for only thus can he stave off the inevitable end.

Mr. Bell, notwithstanding his transcendent intellectual abilities, proved no exception to the rule. There is evidence in this record, ample, complete and demonstrative, that subsequent to the 10th day of April, 1879, a crime of the most atrocious character was committed in the patent office at Washington; that this was done for the sole purpose of covering up and concealing the evidences existing in that office of the crime previously perpetrated there in February 1876, as already outlined.

On pages 5 to 13, of Vol. 4, of complainant's record, there appears a copy of the original application filed by Mr. Bell, which was originally produced in evidence in the *Dowd* case, Feb. 14, 1876.

This is certified to be a true copy from the files of the patent office, in a certificate under the seal of the office, dated April 10, 1879, and signed by W. H. Doolittle, Acting Commissioner of Patents. Reading this copy of the specification carefully from the beginning, we are astounded when we find on page 9, that the specification reads as follows:

"*There are many ways of producing undulatory currents of electricity, but all of them depend for effect upon the vibrations or motion of bodies capable of inductive action.*"

A few of the ways are specified, and then follows the controverted passage, which had been interjected into the specification, describing methods of producing undulations by varying the strengthof the current.

But the passage quoted, which expressly excludes all methods not dependent upon induction, reads, *word for word, exactly as it appears in the George Brown specification.*

Here is an extraordinary phenomenon. The passage appears, as quoted, in the George Brown specification, delivered to Mr. Brown, in January, 1876. In the printed copy of the patent, issued March 7, 1876 (C. Vol 1, page 60), it reads as follows:

" *There are many ways of producing undulatory currents of electricity, dependent for effect upon the vibrations or motions of bodies capable of inductive action.*"

Again, April 10, 1879, it reads, as in the " George Brown specification." And once again, in a photolithographic copy of thr original application on file, produced by complainants (Additional Proofs, page 729), and certified to by M. V. Montgomery, Commissioner of Patents, October 30, 1885, it appears as shown in the printed copy of the patent.

What is the explanation of this juggle? These are stubborn *facts*, and they can not be ignored. The specification, as it was on file in April, 1879, *did read*, " but all of them depend for effect upon the vibrations or motion of bodies capable of inductive action."

Clerical and typographical errors are possible, but the mathematical ratios are millions to one against the substitution by error of the particular five words " but all of them depend " for the one word " dependent." But these five words are the identical words employed in the " George Brown specification." The chances are so incalculable against such a substitution by accident, that error is out of the question as an explanation. It must be recognized as a fact, that these words were actually in the original specification on file in the patent office, as it appeared on the 10th day of April, 1879.

But how could this specification have been printed on

March 7, 1876, with the word "dependent," instead of the words "but all them depend?"

The explanation is as follows:

As we have already been convinced, the passage relating to the production of undulations in the current by varying its power, was not in the original specification when it was filed in the patent office. By means of the conspiracy, the existence of which is an established fact, Mr. Pollok was at once made acquainted with the contents of Mr. Gray's caveat, filed upon the same day with Mr. Bell's application. Sometime between February 14, the day of the filing, and February 19, the day an interference was threatened by an official communication, Mr. Pollok, or some one in his office, through the connivance of the Examiner, effected secretly a substitution of a sheet or sheets in the original application, all being in the handwriting of his own clerk. Through this substitution he effected the introduction of the new passage, all excepting the first sentence, the printing of which in brackets in the certified copy shows it to be an interlineation. The new claim, based upon this passage, was also inserted.

When Mr. Bell shortly afterward arrived in Washington (C. Vol. 2, page 1680, Ans. 563), he of course perceived the incongruity displayed in the arrangement under the general head of the production of undulations by induction, of detailed methods of producing undulations by varying the power of the current, either in the battery or by varying the resistance upon the circuit.

He accordingly interlined the introductory sentence; [" Electrical undulations may also be caused by alternately increasing and diminishing the resistance of the circuit, or by alternately increasing and diminishing the power of the battery."] He also made a number of verbal changes in the specification as indicated in the brackets. The significant fact of these verbal interlineations having been made in the original "fair copy" is established by the document itself, the interlineations being printed in brackets to indicate their character as such, while the fact that the origina specification when filed was a fair copy has also been established by the testimony.

It is well known that at that time merely verbal or clerical corrections were freely permitted to be made in the patent office in this informal manner, to avoid the necessity of an official amendment in detail. The practice was to make these informal amendments in the examiner's room in pencilings upon the paper. Mr. Bell, of course, could not fail to note the inconsistency of the new passage with the words "but all of them depend for effect upon the vibrations or motion of bodies capable of inductive action," which, in the hurry of the secret substitution, had been overlooked. He accordingly drew his pencil through the words "but all of them depend" and interlined the word "dependent," thus making the passage read as it was printed in the patent.

One little circumstance is convincing to the mind, that Mr. Bell did not write originally the new passage inserted in the patent. It contains the following sentences:

"The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit, then the more deeply the conducting wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current."

As regards mercury, this is a false statement. Mercury will not operate at all in that manner. The metal mercury is, in fact, an excellent conductor of electricity, and the depth into which a conducting wire is dipped into it will make no appreciable difference in the resistance to the current upon the circuit. This characteristic property of mercury has led to its frequent use in connection with circuit breakers, to complete the circuit when the conducting wire dips into the mercury.

All this was perfectly familiar to Mr. Bell. In all his early experiments, in multiple telegraphy, mercury was employed to complete the circuit, and, as he states, "The oxidization of the mercury, too, was a source of great annoyance, and was only partially obviated by covering it with alcohol." (See *ante* page 21.) The good electrical conductivity of mercury was as well known and as familiar to Mr. Bell as the fact that fire burns and water flows, is to any child. It is simply impossible that Mr. Bell could have written such nonsense as the passage quoted.

But granting all this, yet how came the specification, as it was on file in April, 1879, to contain again the words, "but all of them depend?"

The explanation is the simplest in the world. Three years had elapsed; the specification had been handled time and again. It was one of the curiosities of the patent office. The pencilings of the word, "dependent" and of the line drawn across the words, "but all of them depend," lying in a fold, had become obliterated. The original words written in ink were once more clear and legible, and the clerk copied them.

Is there any other possible explanation?

But look at it from another standpoint. The fact that these five words "but all of them depend," were legible in the specification, in April, 1879, demonstrates that those words were originally written in that fair copy which was filed in the patent office February 14, 1876, whatever be the means or whatever the manner in which they were obliterated in March, 1876. Otherwise, those words could not have found an existence in that paper in April, 1879.

But the fact that the words, "but all of them depend" were in that fair copy, filed February 14, 1876, demonstrates the further fact that the new passage, so directly in conflict with those words, was not contained at that time in that copy. A man of Mr. Bell's intellectual abilities, having set before himself the high standard of scientific accuracy and completeness of expression in the preparation of this specification, could not have passed an entire day in its careful study and made no change whatever in it, if it had contained two such antagonistic passages. There is but one explanation possible. That new passage was not inserted in the specification until after Mr. Gray's caveat was filed in the patent office. This explanation fits in with every fact, and accords with every circumstance disclosed in the record. It clears up every mystery and satisfies the mind. It is the *truth*, for the truth alone can be in such perfect accord with every fact and every new development in the case.

But the *fact* that these five words, "but all of them depend" were legible in the specification on file in the patent office April 10, 1879, demonstrates another fact of ominous significance.

At the last moment, and during the printing of the record for this court, the complainants produced a photolithographic copy of the original specification, as it appeared in the files of the patent office, certified to by the Commissioner of Patents (Additional proofs, page 729), showing a perfect *fac simile* of each page of the specification. This document establishes the *fact* that the specification actually on file in the patent office October 30, 1885, the date of the certification, was *a clean, fair copy, without an erasure and without an interlineation,* except as indicated for the insertion of the official amendment of February 29, 1876, to which reference has already been made.

Not only is there an entire absence of the words, "but all of them depend," which were in the specification on file April 10, 1879, as shown by the certified copy of that date, but there is not even shown an erasure or interlineation in the context of the specification where those words once appeared. The writing here is as smooth and as straightforward as in every other place in the specification.

The startling fact is thus made manifest, that the papers have been changed in the office; that the specification on file April 10, 1879, is there no longer; that it has been withdrawn from the office and another paper substituted in its place.

A felony has been committed. Another crime has been perpetrated, to destroy the evidence of the commission of the first crime.

The one fact we have cited establishes the proposition. But cumulative evidence exists in abundance.

The original specification on file in the patent office on

April 10, 1879, was full of verbal corrections, as shown by the certified copy of that date. The copy of the specification on file in that office on October 30, 1885, shows not one of them, as demonstrated by the appearance of the photolithographic copy in evidence in this case.

We have already referred to the interlineation of the sentence, ("Electrical undulations may also be caused by alternately increasing and diminishing the resistance of the circuit, or by alternately increasing and diminishing the power of the battery"), as shown in the certified copy of April 10, 1879.

In the photolithographic copy this sentence is not interlined, but appears in its proper place, the same as any other sentence.

Another example, of a most striking character, must be cited.

The "George Brown specification" contains the following sentence (C. Exhibits, Vol. 4, page 939):

> "The vibrations represented by the sinusoidal curves A and B (Fig. IV) are in the ratio aforesaid, 4:5—that is, four oscillations of A are made in the same time as five oscillations of B."

By reference to "Fig. IV" in the drawing it will be seen that this is a correct description. Four lobes of the curve A occupy the same distance upon the horizontal line as five lobes of the curve B. In the certified copy of April 10, 1879, the sentence appears as follows (C. Exhibits, Vol. 4, page 8):

> "The vibrations represented by the sinusoidal curves B (A) and A (B), Figure 4, are in the ratio aforesaid of 4:5—that is, four oscillations of B (A) are made in the same time as five oscillations of A (B)"; the letters in the brackets being thus printed to indicate conventionally the erasures shown in the certified copy.

Turning now to the printed copy of the patent (C. Exhibits, Vol. 1, page 55), we find that the draughtsman, in making the drawing for the patent office, had lettered the curve named "A" in the "George Brown drawing," "B" in the patent office drawing; and likewise the curve formerly named "B" was now lettered as "A." The error was unnoticed in filing the original fair copy of the specification.

This clerical error, or rather the draughtsman's error, made necessary exactly the correction that was made in the specification, by erasing "A" and "B," and substituting "B" and "A," respectively, therefor. This gave "B" the unusual precedence over "A," apparent in the printed copy of the specification issued March 7, 1876.

But the photolithographic copy of the paper on file in the office October 30, 1885, shows no trace whatever of any such correction. This demonstrates the *fact* that this correction, which appeared on the face of the original specification on file in the patent office on April 10, 1879, *never was made in the paper now on file in that office.*

We can no longer resist the conviction forced upon us by these significant facts. The evidence is conclusive. Another and a different paper has been fraudulently and feloniously substituted for the original specification, filed in the patent office, February 14, 1876. It is clear that another crime has been committed in the execution of the foul conspiracy, and it only remains for the Government to discover and punish the guilty parties.

But the *fact* of the execution of this last felony *demonstrates* the commission of the original crime. It fastens upon Mr. Bell the infamy of having perpetrated the most gigantic fraud of the century.

But the proofs are by no means exhausted. The *truth* always fits in with every fact that can possibly be discovered, and is in entire accord with every occurrence that happens.

We have seen how Mr. Bell's previous history, when unfolded to view, afforded us a light which illumined the dark transactions of February, 1876. His subsequent history throws an even stronger light upon the subject.

All that has heretofore been regarded as inexplicable and difficult of comprehension in Mr. Bell's subsequent conduct and utterances is cleared of all mystery, and is plainly understood, now that we have in our possession the great central fact, around which every circumstance groups itself in orderly relation.

We have already seen that at the close of his labors in July, 1875, Mr. Bell discharged Mr. Watson, and abandoned for the time all further experiments upon the telephone.

When he was summoned to Washington, the latter part of February, 1876, he was actually exgaged in experimental work upon the autograph telegraph.

"During June and July, the speaking telephone was the thing to which I devoted my energies and all the applications of multiple telegraphy assumed only secondary importance. Few, if any, experiments relating to the autograph telegraph, or, indeed, to any electrical subject, were made between the end of July, 1875, and March 1876. At that time I was again working at the combination of instruments necessary to put my autograph telegraph into practical operation, as Mr. Hubbard and Mr. Sanders thought that it would prove the most immediately valuable of all my inventions." (Bell, C. Vol. 2, page 1666).

Immediately upon his return from Washington Mr. Bell resumed his experiments upon the telephone, made a liquid transmitter, and for the first time in his life obtained intelligible articulation, as appears from Mr. Watson's testimony already quoted at length.

He had gained new light upon the subject.

Mr. Bell added the following passage to his Preliminary Statement in Speaking Telephone Interferences. (C. Exhibits, Vol. 4, page 1011).

"I ought to state that *I did not, before the filing of my application,*" (February 14, 1876,) "*construct the devices described in my specification for varying the resistance* of a voltaic circuit as means for producing an undulatory current. *I was in Washington the first few days in March,* and *immediately on my return* I constructed an apparatus having a wire attached to a stretched membrane, dipping into a vessel containing water, forming part of a circuit, the resistance of the circuit, being varied by the vibration of the membrane, which caused the wire to dip more or less deeply into the liquid.

"On the 10th day of March, Mr. Watson and myself tried *this apparatus as a transmitter*, using *the steel spring armature depicted in my patent as receiver*, and obtained intelligible articulation. I exhibited an instrument constructed in this way at the Centennial Exhibition in June, 1876, before Sir William Thomson and other judges of his department."

A comparison of the description Mr. Bell here gives of this apparatus, with the similar description of a like apparatus contained in Mr. Gray's caveat, reveals unmistakably the *source* of the new light Mr. Bell had just gained.

"In the drawings, the person transmitting sounds is shown as talking into a box or chamber A, across the outer end of which is stretched a diaphragm *a*, of some thin substance, such as parchment or gold beater's skin, capable of responding to all the vibrations of the human voice, whether simple or complex. Attached to this diaphragm is a light metal rod A^1, or other suitable conductor of electricity, which extends into a vessel B, made of glass or other insulating material, having its lower end closed by a plug, which may be of metal, through which passes a conductor *b*, forming part of the circuit.

"This vesssel is filled with some liquid possessing high resistance; such for instance as water, so that the vibrations of the plunger or rod A^1, which does not quite touch the conducter *b*, will cause variations in resistance, and, consequently, in the potential of the current passing through the rod A^1." (C. Vol. 4, page 870.)

A rude sketch of this apparatus made by Mr. Watson appears in C. Exhibits, Vol. 1, page 313. A comparison of this sketch, with the drawing attached to Mr. Gray's caveat, shows that there was no substantial difference in the mode of operation in the two cases.

This apparatus was a transmitter. Mr. Bell next made a receiver, which also could be used both as a transmitter and a receiver in a magneto telephone. Mr. Watson testified regarding this instrument as follows (C. Vol. 1, page 324):

"*Cross-Int*. 224. When was the first time that you ever heard and understood words transmitted over a telephone line by means of a magneto transmitter? *Ans.* My recollection now is that I heard and understood words from a magneto transmitter shortly after March 10, 1876.

Cross-Int 227. That instrument had a membrane diaphragm, I suppose, had it not? *Ans.* I think it had.

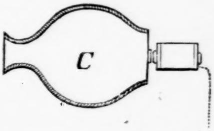
"*Cross-Int.* 228. Describe the armature, its size, shape, material and manner of attachment to the diaphragm in that instrument. *Ans.* All that I can remember about it is that it consisted of a piece of clock-spring shellacked to the membrane. I do not remember the dimensions at all.

"*Cross-Int.* 229. Was that the first magneto instrument which had a metal armature attached to and supported only by the diaphragm? *Ans.* It was the first I remember.

"*Cross-Int.* 230. Who made that instrument, and when? *Ans.* I think I did, just before it was tested.

"*Cross-Int.* 231. It was made after March 10, 1876, was it not? *Ans.* According to my recollection."

Here is the cut of Mr. Gray's receiver, as shown in the drawing attached to his caveat, and reproduced from the exhibit in the *Dowd* case just obtained.



The description given by Mr. Watson, as well as that given by Mr. Bell in the passage already quoted from his London Lecture, corresponds perfectly to this drawing. There can be no possible doubt as to where Mr. Bell obtained the idea of this construction. He would have given worlds for the possession of such a conception in the preceding June and July, and he had abandoned the work for want of it.

Everything points to a single conclusion. Mr. Bell stole the ideas set forth by Mr. Gray in his caveat. He appropriated those ideas to himself; first, by means of the new passage interjected into his patent; and secondly, by embodying them into the construction of instruments, both the varying resistance and the magneto, and instruments through which he for the first time transmitted articulate speech. *Mr. Bell stole the telephone from Mr. Gray, and such will be the verdict of history.*

Mr. Bell was compelled to add the passage already cited to his preliminary statement in the Speaking Telephone

Interferences, for that paper was, so to speak, to be his title deed in his contest with Mr. Gray. Besides, it would be filed in the secret archives of the patent office, and be inaccessible to the public.

But how did Mr. Bell treat the matter in his public utterance?

In his London Lecture, delivered October 31, 1877, Mr. Bell gave a connected history of his development of the telephone, from its first inception, through the successive steps, down to that date. Now, obviously, the most interesting point in the whole history was the hour of the final consummation of all his thoughts, and hopes, and labors; the hour, when, for the first time in his life, he had succeeded in the transmission of articulate speech. It was an hour of excitement, of exhileration, an hour never to be forgotten.

Turning now to that London Lecture, (C. Exhibits 4, page 879) and particularly to the passage already quoted, we find that Mr. Bell never mentioned that hour or a single circumstance connected with the occurrence. On the contrary, the language he employed was such as to naturally produce the impression that the first distinctly audible effects were obtained with magneto instruments, while, as a matter of fact, those instruments were constructed subsequently to the varying resistance transmitter with which he first obtained intelligible articulation.

Such conduct is no longer inexplicable. We now know that it was the discreet silence of one who held stolen property in his possession.

Other details might be mentioned, but time forbids. Every fact that shall be established, now or hereafter, can only fall into line and add its bit of confirmation. "The mills of the Gods grind slowly, but they grind exceeding fine."

It ~~it~~ is with heartfelt satisfaction that we are enabled to state our conviction that complainants present counsel are absolutely free from all complicity or connivance, either in the perpetration or in the attempted concealment of the frauds the commission of which has been so clearly established by the evidence in this case. Indeed, the character of this evidence, and the remarkable manner in which it has been introduced in the complainant's own record, preclude even the possibility of a question in this matter.

Under the circumstances, it is but a simple requirement of justice that this conviction should here find expression.

T. S. E. Dixon,

Of Counsel for the People's and Overland Telephone Companies.

PHONE COMPANY,-1

Circuit Court of the United States

SOUTHERN DISTRICT OF NEW YORK.

IN EQUITY.

The American Bell Telephone Company and the Metropolitan Telephone and Telegraph Company, Complainants,

vs.

The People's Telephone Company, Joseph Loth, Julius Bien, Marcus Marx, Auguste H. Girard, John N. Goodwin, Frank A. Klemm, Ernest Marx, Edgar W. Chellis, Richard C. McCormick, Henry D. Cooke, Jr., Max L. Gutmann, Moritz Loth, and Simon Wolf, Defendants.

The separate answer of The People's Telephone Company, one of the above-named defendants, to the bill of complaint of the American Bell Telephone Company and the Metropolitan Telephone and Telegraph Company, Complainants.

This defendant, now at all times hereafter saving and reserving unto himself all benefit and advantage of exceptions which can or may be had to the many errors, uncertainties, and other imperfections in the said complainants' said bill of complaint contained, for answer thereunto, or unto so much, and such parts thereof as this defendant is advised, is, or are, material or necessary for it to make answer unto, this defendant, separately answering, says:

1. This defendant admits that Letters Patent of the United States of

America, numbered 174,465, were granted and issued to Alexander Graham Bell, dated the seventh day of March, A. D. 1876, for an alleged invention in telegraphy, as in said bill of complaint alleged.

2. This defendant admits that Letters Patent of the United States of America, numbered 186,787, were granted and issued to said Alexander Graham Bell, dated the 30th day of January, A. D. 1877, for an alleged invention in Electric Telegraphy, as in said bill of complaint alleged.

3. This defendant has no knowledge that the complainant so-called corporations are duly established and authorized bodies corporate, or that either of them is a duly established and authorized body corporate, as in said bill alleged, and calls for due proof thereof.

4. This defendant has no knowledge of the several alleged assignments, grants, and licenses, referred to in said bill, by and through which the complainants pretend to have derived alleged rights from said Bell, directly or indirectly, as in the bill alleged, and calls for due proof of all and every thereof.

5. This defendant has no knowledge that the alleged inventions described in said Letters Patents, or either of them, was or were ever embodied in instruments known as Bell Telephones, or in instruments known as Blake Transmitters, or in any of such instruments as alleged in said bill, and therefore calls for due proof thereof.

6. On information and belief, this defendant denies that the said alleged inventions, described and contained in the said several letters patent here in suit, everywhere, or either of them ever was, introduced into general or extensive use in public; and, further, on information and belief, it says that the telephones heretofore introduced into general use, as referred to in said bill, were not of the same, nor substantially the same construction and operation, as the machines and instruments described in said letters patent, or either of them, but were of substantially different construction and mode of operation, and were not the same, but substantially different inventions. And, having no knowledge of the actual extent to which electric telephones have been, up to the filing of said bill, introduced into public use, it calls for due proof thereof, if such matter shall in anywise be or become material in this cause.

7. Save by hearsay and by the allegations of said bill, this defendant has no knowledge of the several suits alleged in the bill to have been instituted, nor of the several decrees or orders alleged to have

PHONE COMPANY,-1

been obtained or made therein, or of any of the alleged proceedings therein; but upon such information as it has been able to obtain, it charges that the said several suits were, and each of them was, collusive and fraudulent; that no proper defense was made to them, or any of them, and that the alleged proceedings, orders, and decrees therein, are and each of them is, of no force and effect, except as between the parties to said suit or suits and their privies.

8. Upon information and belief, this defendant denies that the patents upon which this suit is brought are good and valid patents, or that either of them is a good and valid patent; it denies that the validity of them, or either of them, has been generally recognized and acknowledged as in the bill alleged; and it denies that the claims of said Bell, of Gardiner G. Hubbard, of the complainants, and of their predecessors, to the exclusive right to said alleged inventions under said patents, have been generally acknowledged and acquiesced in as in the bill alleged. Further answering, this defendant says, that not only has the validity of said patents, and of the complainants' claims thereunder, not been generally acknowledged and acquiesced in, but that such fact is, and has long been, of great public notoriety; that it has long been notorious that Elisha Gray, of Chicago, Illinois; Thomas A. Edison, of Menlo Park, New Jersey; Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, and others, have claimed, and still do claim, each for himself, to be the original and first inventor of the inventions described, shown, and claimed in said two Bell patents, and in each of them; that it has long been notorious that, at the time when said patents were granted to said Bell, said Gray had a caveat on file in the United States Patent Office, and in full force and effect, describing and claiming the same invention, and that he, said Gray, ought to have been notified of the pendency of said Bell's application, and allowed to come into the Patent Office with an application and contest said Bell's right to a patent, and obtain a decision upon the question of priority of invention between himself and said Bell before the issue of any patent to either; but that his caveat was overlooked by the Commissioner of Patents, and the patent was unlawfully issued to said Bell without any notice to said Gray, or any opportunity for him to prove his own prior invention; that it has long been notorious that, for years past, interferences have been, and now are, pending undetermined in the Patent Office between said Bell, Gray, Edison, and many others, to determine who is the original and first inventor of

the matters described, shown, and claimed in said two patents here in suit, and in each of them respectively; that it has long been notoriously understood and believed that the owners of said Bell patents upon which this suit is brought are so well aware of the doubtfulness of their alleged rights thereunder that, although said Gray and his licenses, and said Edison and his licenses, have made, sold, and put into use all over the country large numbers of speaking telephones containing the alleged inventions, respectively, of said Gray, and of said Edison, and infringing the claims of said Bell patents, and are still making, selling, and putting into use large numbers of such infringing telephones, yet the complainants have never *bona fide* instituted and prosecuted to final judgment or decree a suit or suits therefor, but have allowed, and still allow, such extensive and notorious manufacture, sales, and use to continue undisturbed; that, further, it has long been, and still is, notoriously understood and believed, that the owners of the said Bell patents, distrusting the ultimate result of the said pending interferences, and fearing the decision or decisions of the Commissioner of Patents declaring the said Bell not to be the original and first inventor of the inventions shown in his safe patent or patents, have entered into an agreement and contract, or agreements and contracts, with said Gray, Edison, and others, or with their assignees, in writing, providing for the contingency of a decision of the Commissioners of Patents adverse to said Bell in said interferences, and of the decisions of the Courts adverse to said Bell's claims as the original and first inventor of the matters claimed in his said patents, or either of them, and arranging the terms and conditions upon which said Bell telephones shall be licensed by said Gray or by said Edison, respectively, in the event that said Gray or said Edison shall be adjudged the original and first inventor thereof; that the evidence of said interferences, and the proceedings therein, and of the exact terms, conditions, and provisions of said contract or contracts between said Bell, Gray, and Edison, or the respective owners of the alleged inventions claimed by said Bell, Gray, and Edison, respectively, is not in the possession and control of these defendants, or any of them, but of the said interfering applicants and patentees, and their assignees, and of the parties to said contract or contracts, and can be obtained only by an examination of said persons or parties, or by order of this Honorable Court.

9. Further answering, this defendant denies that the said first Bell

LEPHONE COMPANY,-1

patent, No. 174,465, is valid, and alleges, and answers, that it is invalid and void, for the following reasons, to wit:

A. Because the machine or instrument described, shown, contained, and claimed therein, is not a patentable invention, but is an inoperative, useless, and worthless device.

B. Because the said Alexander Graham Bell was not the original and first inventor or discoverer of any material and substantial part of the thing patented; but before his alleged invention or discovery thereof, the same, or substantially the same thing or things, had been invented and used by, and were known to the following-named persons, of and at the following-named places, to wit:

Elisha Gray, of and at Chicago, in the county of Cook, and State of Illinois.

Thomas A. Edison, of and at the village of Menlo Park, in the State of New Jersey, and at the city of New York, in the State of New York.

Daniel Drawbaugh, of and at Eberly's Mills, in the county of Cumberland, and State of Pennsylvania.

C. Because, in view of the state of the art at the time of the alleged invention of said Bell, the claims of said patent are too broad, covering inventions before made by others, and of which he was not, and his assigns are not, entitled to the exclusive use and enjoyment.

D. Because the said Bell, in obtaining said patent, surreptitiously and unjustly obtained a patent for that which was in fact invented by another, to wit: said Elisha Gray, who was using reasonable diligence in adapting and perfecting the same.

E. Because the said Bell, in obtaining said patent, surreptitiously and unjustly obtained a patent for that which was in fact invented by another, to wit: said Thomas A. Edison, who was using reasonable diligence in adapting and perfecting the same.

F. Because the said Bell, in obtaining said patent, surreptitiously and unjustly obtained a patent for that which was in fact invented by another, to wit: said Daniel Drawbaugh, who was using reasonable diligence in adapting and perfecting the same.

10. Further answering, this defendant denies that the said second Bell patent, No. 186.787, is valid, and alleges and answers that it is invalid and void for the following reasons, to wit:

A. Because the machine or instrument described, shown, contained, and claimed therein is not a patentable invention, but is an inoperative, useless, and worthless device.

B. Because the said Alexander Graham Bell was not the original and first inventor or discoverer of any material and substantial part of the thing patented; but before his alleged invention or discovery thereof, the same, or substantially the same thing or things, had been invented and used by, and were known to the following-named persons, of and at the following-named places, to wit:

Elisha Gray, of and at Chicago, in the county of Cook, and State of Illinois.

Thomas A. Edison, of and at the village of Menlo Park, in the State of New Jersey, and at the city of New York, in the State of New York.

Daniel Drawbaugh, of and at Eberly's Mills, in the county of Cumberland, and State of Pennsylvania.

C. Because, in view of the state of the art at the time of the alleged invention of said Bell, the claims of said patent are too broad, covering inventions before made by others, and of which he was not, and his assigns are not, entitled to the exclusive use and enjoyment.

D. Because the said Bell, in obtaining said patent, surreptitiously and unjustly obtained a patent for that which was in fact invented by another, to wit: said Elisha Gray, who was using reasonable diligence in adapting and perfecting the same.

E. Because the said Bell, in obtaining said patent, surreptitiously and unjustly obtained a patent for that which was in fact invented by another, to wit: said Thomas A. Edison, who was using reasonable diligence in adapting and perfecting the same.

F. Because the said Bell, in obtaining said patent, surreptitiously and unjustly obtained a patent for that which was in fact invented by another, to wit: said Daniel Drawbaugh, who was using reasonable diligence in adapting and perfecting the same.

11. Further answering, this defendant says that Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, was and is the original and first inventor and discoverer of the art of communicating articulate speech between distant places by voltaic and magneto electricity, and of the construction and operation of machines and instruments for carrying such art into practice; that long prior to the alleged inventions by said Alexander Graham Bell, and long prior to the respective inventions of said Gray and said Edison, said Daniel Draw

baugh, then and now residing at said Eberly's Mills, constructed and operated practical working electric speaking telephones at said Eberly's Mills, and exhibited their successful operation to a great number of other persons resident in his vicinity and elsewhere; that the said electric speaking telephones, so constructed and successfully and practically used by him, as aforesaid, contained all the material and substantial parts and inventions patented in said patents No. 174,465 and No. 186,787, granted to said Bell; and also contained other important and valuable inventions in electric and magneto telephony, and were fully capable of transmitting, and were actually used for transmitting, articulate vocal sounds and speech between distant points by means of electric currents; that some of the original machines and instruments invented, made, used, and exhibited to many others, long prior to the said alleged inventions of said Bell, or either of them, are still in existence, and capable of successful practical use, and are identified by a large number of persons who personally tested and used, and knew of their practical operation and use, in the years 1870, 1871, 1872, 1873, 1874, and both subsequently and prior thereto; that certainly more than fifty, and probably not less than one hundred persons, or even more, were cognizant of said Drawbaugh's invention and use of said telephones, and of his claim to be the original and first inventor thereof, prior to the alleged invention of said Bell, or either of them; that said Drawbaugh, for more than ten years prior to the year 1880, was miserably poor, in debt, with a large and helpless family dependent upon his daily labor for support, and was, from such cause alone, utterly unable to patent his said invention, or caveat it, or manufacture and introduce it upon the market; that said Drawbaugh never abandoned his said invention, nor acknowledged the claims of any other person or persons thereto, but always persisted in his claims to it, and intended to patent it as soon as he could procure the necessary pecuniary means therefor; that said Drawbaugh never acquiesced in the public use of said Bell, Gray, Edison, Blake, or other telephones, nor in the claims of the alleged inventors thereof, nor gave his consent to such use; and that, in view of the facts aforesaid, neither said Bell nor any other person or persons whatever, except the said Drawbaugh, can now obtain a valid patent therefor, nor are the patents granted to said Bell as aforesaid, or either of them, of any validity or value whatever.

12. Further answering, this defendant says that the said Daniel Drawbaugh, after making, testing, using, and extensively exhibiting his in-

vention to others, and allowing them experimentally to personally test and ascertain its successful practical operation and utility, as aforesaid, and after the full and repeated demonstration of its successful working, as aforesaid, conceived that its range and capacity of usefulness to the public might be very greatly enlarged; that many improvements of great value might be made and added to it which, without departing from its principle, might increase its value to himself and to the public, and therefore set himself at work to discover and invent such improvements; that he discovered and invented some of said additional improvements prior to any alleged invention by the said Bell; and that, notwithstanding his embarrassed and impoverished pecuniary condition, and his utter want of proper mechanical tools, materials, and appliances to conduct such work, he labored with all reasonable diligence to perfect and adapt his said improvements, and did finally, in due exercise of such reasonable diligence, perfect and adapt the same; and that, in so far as the said Bell has incorporated such improvements in his said two patents, or either of them, he, the said Bell, has surreptitiously and unjustly obtained a patent or patents for that which was in fact first invented by said Drawbaugh, who was using reasonable diligence in perfecting and adapting the same; and therefore the patent or patents of the said Bell therefor is, or are, invalid and void.

13. Further answering, this defendant says that it has, by purchase, and for a valuable consideration, acquired the right, title, and interest of said Daniel Drawbaugh in and to all his said inventions, discoveries, and improvements in electric speaking telephones, and has full right, at law and in equity, to make, sell, and use electric speaking telephones, embodying the inventions, discoveries, and improvements of said Drawbaugh, without interference from or molestation by said Bell or his assigns, and without liability to these complainants therefor.

14. Further answering, this defendant says that it has, in good faith, and relying upon its legal rights aforesaid, caused applications to be made and filed in the Patent Office for letters patent upon the inventions of the said Daniel Drawbaugh, with the intention of procuring interference proceedings to be instituted, in accordance with the statute, against the patents of said Bell, and the pending applications of said Gray, Edison, and others, in order that said Drawbaugh may be adjudged by the Commissioner of Patents to be, as he rightfully is, the original and first inventor of the electric speaking telephone, and may be adjudged entitled to receive a patent or patents therefor.

15. This defendant, further answering, denies all and all manner of unlawful conspiracy and confederacy with other persons and parties as charged in the complainants' bill of complaint; denies all knowledge of the alleged newspaper publications referred to in said bill, and calls for due proof of said alleged publications, if the complainants shall be advised that they are of any materiality to this suit, which this defendant denies; and denies all the allegations of the complainants' bill as to the said Drawbaugh invention, and, particularly, the allegations that said Drawbaugh's invention was a mere experiment, was incomplete, imperfect, unfruitful, and that knowledge of it was withheld from the public, except so far as disclosed by said alleged newspaper publications in said bill mentioned and set forth. And this defendant charges that the contrary of all said allegations is true; that this defendant has done no unlawful or inequitable act in the premises; that it is not responsible for said alleged newspaper publications; that said Drawbaugh's original invention was complete, successful, operative, and practically and successfully operated, and reduced to practice as a "Speaking Telephone" on many occasions in the presence and hearing of many other persons, and knowledge thereof was freely communicated to the public by said Drawbaugh; and that said Drawbaugh's improvements, additional to his said original invention, were complete, successful, and practical inventions; that all of his said inventions were fully reduced to practice and communicated to others; but that said other persons, having knowledge of his legal and equitable right in and to his said inventions, and respecting and acquiescing in the same, desisted and refrained from making and using his said inventions, and acquiesced in his right thereto, and never did, so far as this defendant is informed and believes, any act to impair his said rights or which would prevent the grant of a good and valid patent or patents to him, the said Daniel Drawbaugh, or his assigns, for any or all of his said inventions.

16. This defendant, further answering, says that so far and to such extent as electric speaking telephones were put on sale and into public use in this country, by others than said Drawbaugh, prior to said Drawbaugh's application for a patent thereon, as aforesaid, such specific machines and instruments, so put on sale and into public use, were not the specific machines and instruments invented by said Drawbaugh, as aforesaid, but were machines and instruments invented by others, subsequently to the original and first invention of the electric speaking telephone by said Drawbaugh, and subsequently to the invention of

his said improvements thereon, as aforesaid; and that, as this defendant is informed and believes, such machines and instruments were so put on sale and into public use, not from or by reason of any information derived from or through said Drawbaugh, but by an independent invention, or independent inventions thereof, by others subsequently to said Drawbaugh's original and first invention as aforesaid, and while said Drawbaugh was unable, by reason of his poverty and other controlling circumstances, as above set forth, to patent his said inventions; and that such public use and sales were without the consent, allowance, or acquiescence of said Daniel Drawbaugh.

And this defendant, as advised by its counsel, further answers and says, that the alleged invention of the electric speaking telephone by said Bell, subsequently to said Drawbaugh's invention thereof, as aforesaid, conferred upon said Bell, or his assigns, no legal right to a patent or patents thereon, nor did it impair the legal right of said Drawbaugh to a patent or patents upon his own prior inventions; and that the alleged public use and sales of such subsequently invented telephones, without said Drawbaugh's consent, allowance, or acquiescence as aforesaid, and by reason of knowledge and information of their construction and operation, not derived from or through said Drawbaugh, have in law no effect to forfeit or bar said Drawbaugh's right to the exclusive use of his own prior invention, nor to prevent him or his assigns from obtaining a valid patent or valid patents thereon.

17. This defendant, further answering, says that it is not informed, save by the complainants' bill, whether such alleged public sales and the use of the Bell telephones, and other electric speaking telephones, was for more than two years prior to the filing of said Drawbaugh's application for letters patent upon his own prior inventions as aforesaid, and therefore it calls for due proof thereof; but it denies that any telephones so sold or used were the specific machines or instruments invented by said Drawbaugh as aforesaid, or were put on sale or into public use with the consent, allowance, or acquiescence of said Drawbaugh; and, therefore, as advised by its counsel, it denies that such alleged public use or sale, even if for more than two years before said Drawbaugh's application for a patent upon his invention, (of which it calls for due proof,) will operate in law to confer any rights upon said Bell, or upon the public, or to bar said Drawbaugh from obtaining a valid patent or patents upon his said invention or discovery.

18. This defendant denies that it has ever infringed the said two patents, No. 174,465, and No. 186,787, here in suit, or either of them.

19. This defendant, further answering, denies each and every allegation, statement, and charge of the complainants' bill of complaint, except such as are herein above specifically admitted to be true, and except such as are herein-above expressly declared not to be within the knowledge or information of this defendant; and of all the latter it calls for due proof.

UNITED STATES OF AMERICA, }

County of New York. }

Personally appeared before the undersigned, a notary public in and for said county and State, Richard C. McCormick, who, being duly sworn, deposes and says, that he is president of said The People's Telephone Company; that he has read the foregoing answer by him subscribed, and knows the contents thereof; that all the matters therein stated as the acts of said corporation he knows to be true; that all other matters therein stated he believes to be true.

Sworn to and subscribed before me this day of December, 1880.

AMERICAN BELL TELEPHON

PHONE COMPANY,-1

Circuit Court of the United States

SOUTHERN DISTRICT OF NEW YORK.

IN EQUITY.

The American Bell Telephone Company and the Metropolitan Telephone and Telegraph Company, Complainants,

VS.

The People's Telephone Company, Joseph Loth, Julius Bien, Marcus Marx, Auguste H. Girard, John N. Goodwin, Frank A. Klemm, Ernest Marx, Edgar W. Chellis, Richard C. McCormick, Henry D. Cooke, Jr., Max L. Gutmann, Moritz Loth, and Simon Wolf, Defendants.

The separate answer of
one of the above-named defendants, to the bill of complaint of the American Bell Telephone Company and the Metropolitan Telephone and Telegraph Company, Complainants.

This defendant, now and at all times hereafter saving and reserving unto himself all benefit and advantage of exceptions which can or may be had to the many errors, uncertainties, and other imperfections in the said complainants' said bill of complaint contained, for answer thereunto, or unto so much, and such parts thereof as this defendant is advised, is or are material or necessary for him to make answer unto, this defendant, separately answering, says:

1. He admits the issue of the complainants' patents, as stated in the bill of complaint.

2. He denies that he has ever infringed said patents or either of them.

3. He denies all and all manner of unlawful conspiracy and confederacy with other persons or parties, as charged in the bill of complaint.

4. He has no knowledge whether the complainants are, or either of them is, duly and legally incorporated, and calls for due proof thereof.

5. He has no knowledge whether said patents, No. 174,465 and No.

186,787, are, or either of them is, the exclusive property of the complainants, or either of them, and calls for due proof thereof.

6. He denies the validity of both and each of said two patents here in suit, for the following reasons, to wit:

I. Because the said Bell was not the original and first inventor or discoverer of any material and substantial part of the things so patented, or either of them, but the same thing and things had been, before his supposed invention and discovery thereof, invented by and known to Daniel Drawbaugh, of and at Eberly's Mills, in the county of Cumberland, and State of Pennsylvania, invented by and known to Elisha Gray, of and at Chicago, in the county of Cook, and State of Illinois, and invented by and known to Thomas A. Edison, of and at the village of Menlo Park, in the State of New Jersey, and at the city of New York, in the State of New York.

II. Because said Bell surreptitiously and unjustly obtained both and each of said patents here in suit for that which was in fact invented by others, to wit, said Elisha Gray, said Thomas Edison, and said Daniel Drawbaugh, respectively, who were each using reasonable diligence in adapting and perfecting the same and each of the same inventions.

7. As to all other matters and things stated and charged in the bill of complaint, and not herein-above expressly referred to and specifically answered, this defendant adopts the answer filed in this cause by the People's Telephone Company, which he believes to be true, and prays that it may be read in connection with this answer, and as a part thereof.

EVIDENCE FOR RESPONDENTS,

Taken pursuant to the sixty-seventh rule of the Supreme Court of the United States in equity, as amended, before me,

FRED. M. OTT, *Examiner.*

Present, J. J. Storrow, Esq., for complainants, and M. W. Jacobs' Esq., and L. Hill, Esq., for respondents.

Counsel for respondents offer the following testimony:

Mr. Hill submits a stipulation providing for the appointment of Frederick M. Ott special examiner in this suit, and asks to have it made a part of the record.

ABRAHAM B. SHANK, *being produced, affirmed and examined, saith in answer to interrogatories, the defendant's counsel requesting to have the depositions taken orally, by questions and answers:*

Q. 1. State your age, residence, and occupation.

A. My residence is in Cumberland county, Pennsylvania; I am forty-nine; have been constable of Lower Allen township, Cumberland county, Pa., for the last seventeen years.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.?

A. Yes, sir.

Q. 3. How long have you known him?

A. Near thirty years.

Q. 4. Do you know anything about his having invented an electric talking machine? If yea, state when and under what circumstances you first had any knowledge on that subject.

A. Well, I know that he had one, and it was about in 1869 when I first saw it.

Q. 5. How came you to see it at that time?

A. Well, I was collecting taxes, and a good many folks were working there and I was back and forward pretty often; he was back with his taxes—that is Daniel Drawbaugh was back with his taxes a good bit.

Q. 6. Where did you see the instrument at that time?

A. In the machine shop—the shop where he had been working.

Q. 7. Do you mean Drawbaugh's shop, at Eberly's Mills, near his house?

A. Yes, sir.

Q. 8. In what place within that shop did you see the instrument or instruments at that time?

A. Well, in a small room where he had—where he had his things in.

Q. 9. Did you at that time talk through the instrument or hear anybody talk through it?

A. Yes, sir; Daniel Drawbaugh talked through it.

Q. 10. State whether you were in the same room with him when he talked through it or in a different room.

A. It was a different room.

Q. 11. Were the two rooms, namely, the one in which he was and the one in which you were, on the same floor of the shop or on different floors?

A. On the same floor, the first time he spoke to me; another time, then, it was on another floor.

Q. 12. Were the two rooms at the time when he first spoke to you through the instrument adjoining each other, or was there a room or rooms between them?

PHONE COMPANY,-1

A. There was two rooms adjoining each other.

Q. 13. What kind of a partition was there between the two rooms?

A. A board partition.

Q. 14. Was there a door in the board partition between the two rooms?

A. Yes, sir.

Q. 15. Was the door open or closed while he was talking and you listening at the machine?

A. Well, I think it was closed; I ain't just positive, but I think it was closed.

Q. 16. At that time, how far was the instrument at which you listened from the instrument at which he talked?

A. Well, I would suppose it was about twenty feet—I really don't know how long that shop is; I never paid particular attention.

Q. 17. Were the two instruments in any way connected—and if so, how?

A. Yes, sir; they were connected with wire—I took it to be wire.

Q. 18. What was the appearance of the wire?

A. Well, they—it was a—the wire was wrapped; it was wrapped wire—plain wrapped wire.

Q. 19. How many wires were there?

A. There were two wires.

Q. 20. Do you mean that the two instruments were connected by two wires?

A. Yes, sir.

Q. 21. Did you hear through the instrument anything that Mr. Drawbaugh said at that time?

A. Yes, sir.

Q. 22. Could you understand what it was that he said?

A. Yes, sir.

Q. 23. Could you distinguish Drawbaugh's voice through the instrument so as to recognize it as his voice, and not the voice of some other person?

A. Yes, sir.

Q. 24. Did you have any conversation with Mr. Drawbaugh at that time about the invention?

A. No, sir.

Q. 25. Do you remember whether at that time you saw any electrical batteries connected with the machines or wires?

A. No, sir; not as I mind.

Q. 26. Did you understand at that time whether the instrument worked by electricity or not?

A. No, sir.

Q. 27. When did you next see the machines, or similar machines, at Mr. Drawbaugh's shop?

A. Well, it was about two, three, or four years after that: I saw him with another machine.

Q. 28. Referring now to the last-mentioned machine, was Daniel Drawbaugh present when you first saw it?

A. Yes, sir.

Q. 29. Did you hear any conversation through this last machine when you first saw it?

A. Yes, sir.

Q. 30. Who talked through it?

A. Daniel Drawbaugh.

Q. 31. Were he and you in the same room or different rooms while he was talking through it?

A. He was up stairs and I was in another floor down stairs—the next floor to it.

Q. 32. How far were you from him while the talking was going on through the instrument?

A. Well, that I can hardly answer. I don't know how long the shop is—how high the ceiling is. It may be twenty-five or thirty feet. feet. I really couldn't tell that.

Q. 33. Were you in the same or opposite ends of the shop?

A. Well, he was on the north side of the shop up stairs and I was on the south side of the shop down stairs.

Q. 34. Was the instrument at which he talked and the one at which you listened connected in any way, and if so, how?

A. Yes, sir; they were, with wires.

Q. 35. What was the appearance of the wires, and how many wires were there?

A. Well, there were two wires—that is, the same wires as was on the first machine. The same kind of wires.

Q. 36. Could you hear and understand what he said through the instrument?

A. Yes, sir.

Q. 37. Could you distinguish the character of his voice through the

PHONE COMPANY,-1

instrument so as to distinguish between his voice and the voice of somebody else?

A. Yes, sir.

Q. 38. Were the places where he was and where you were, while he was talking through the instrument, so situated that you could hear conversation from one place to the other without the aid of the instrument?

A. No, sir.

Q. 39. Can you describe that instrument at which you listened at this time last referred to?

A. I can't describe it, but I know the machine if I see it.

Q. 40. Did you place it to your ear in listening to his voice?

A. Yes, sir.

Q. 41. Do you remember the fact of M. M. Grove, Wilson Bear, Jacob Kline, and J. A. Moore, under the firm name of M. M. Grove & Co., manufacturing axles for some time at Daniel Drawbaugh's shop?

A. Yes, sir.

Q. 42. Was it before or after said firm commenced the manufacture of axles at said shop, that you saw this last mentioned machine or machines, and heard Mr. Drawbaugh talk through it, from one floor to another, as you have testified?

A. It was just about the time the company got into operation—the axle company.

Q. 43. At that time did you see the instrument into which Mr. Drawbaugh talked?

A. Well, I didn't pay much attention to that; more so to the one I listened at.

Q. 44. Did you have any conversation with Mr. Drawbaugh about the invention at the time when he showed you this last mentioned machine, as you have testified?

A. Yes, sir.

Q. 45. What did he then say about it?

A. Well, he said a good bit about it then; had an argument on it; yes, sir, he said it was the greatest invention ever was known; if he, that is, if he had the means to go on with it, he said they could talk, or rather be a time to come, as to talk to the old country same as we talk here. Then I asked the question how the wires could be made across the ocean. He says they would have to be sunk to the bottom and the argument was with me, as the ocean had no bottom at some places, they said. That is about all we had then on those things, just at that time.

Q. 46. Did he at that time state how the machine operated—that is to say, whether by electricity, magnetism, or otherwise?

A. He said it works by electricity.

Q. 47. Did you at that time see any batteries connected with the machine or wires?

A. I seen batteries; yes, I didn't pry into that hardly; it had some stuff in it; I don't know what they were, though.

Q. 48. How did you know they were batteries?

A. Well, he showed them to me—that is Daniel Drawbaugh showed them to me.

Q. 49. What did he say about them and their use?

A. Well, I hardly know what he said any more.

Q. 50. Did he explain what they were for?

A. Well, that I can't answer; he did explain it, but I can't answer what he said to it. Then he—at the same time—he showed me these steel magnets—I don't know what he was going to do with them. He said, "I am going to experiment more and more with them—them machines." I didn't see them machines that he was alluding to at that time.

Q. 51. What kind of magnets were those that you last referred to?

A. Well, they were both made out of steel, I suppose, and they were these magnets—you can see them in the stores.

Q. 52. What was the shape of these magnets?

A. Well, I hardly can tell you—shaped like this: [*Witness here makes a mark like a letter U.*]

[*Mr. Hill hands the examiner an instrument to be marked for identification, and which will be offered in evidence hereafter. Examiner marks the instrument with the letter "A" and his initials, "F. M. O."*]

Q. 53. Please examine the instrument, which I now hand you, and which the examiner has just marked with the letter "A" and his initials, and state whether you ever saw it before, and if you did, state when and where you first saw it?

A. Yes, sir; I saw it at the time; just about when the axle company came into operation—in about '73 or '74—in about that time; in '73 or '74 I saw this; he spoke through this—talked through this, at Daniel Drawbaugh's shop.

Q. 54. Did you talk through this at the time, about which you have

PHONE COMPANY,-1

testified, when Drawbaugh was on one floor and you on the floor just below, or was it at some other time?

A. He talked through this—Daniel Drawbaugh—it was at that time.

Q. 55. Is this the instrument into which he talked or the one at which you listened?

A. This is the one he talked in.

Q. 56. How did the instrument at which you listened compare with this?

A. Another machine—I can't identify that machine rightly.

Q. 57. Was the instrument which you held to your ear an instrument shaped like this or differently shaped?

A. I think it was differently shaped; I can't recollect that any more.

Q. 58. At the time when you first saw any talking machine at Drawbaugh's shop, what was the appearance of the machine into which he talked?

A. Well, that is the first machine. The first machine was a glass tumbler. There was a mouthpiece, or whatever they call it, to it, and the tumbler was well lined with something; I don't know what they might call it—glazed.

Q. 59. What was the color of the lining in the tumbler?

A. White.

Q. 60. Did you look into the mouthpiece to see what was inside of it?

A. Yes, sir.

Q. 61. What did you see?

A. Well, I didn't see much—there was a water or liquid and a bladder or cover over it.

Q. 62. Where was the bladder or cover?

A. Well, it was right over the inside; I can't tell you; I can better show you than tell.

Q. 63. Please examine the glass which I now hand you, and which the examiner will please mark with the letter "F" and his "initials," and state whether you ever saw it before, and if so, what is it?

A. Yes, sir; I saw this; this was the first I saw of his invention.

Q. 64. The bottom of the tumbler appears to be gone now; what was its condition when you first saw it?

A. It was whole. I wouldn't positively say it was whole, either, because it was covered over with other things—tin—there was a bladder here, but I am confident it was a whole tumbler when I saw it.

Q. 65. Where was the bladder applied to this tumbler?

A. Here, [indicating the larger end of the tumbler,] the mouthpiece was put on so, [indicating and putting the mouthpiece over the large end]. You could look in through the mouthpiece and see the water through the bladder; the bladder was clear, so you could see through it.

Q. 66. Please look at the instrument which I hand you, and which the examiner will please mark with the letter "B" and his "initials," and state whether you ever saw it before, and if you did, state when and where you first saw it?

A. Yes, sir; I saw that machine at Daniel Drawbaugh's shop about the same time I saw that, in 1869, [pointing to tumbler "F."]

Q. 67. Was this machine, marked "B," a part of the apparatus which Mr. Drawbaugh showed you the first time you saw his talking machine operate?

A. Yes, sir.

Q. 68. Into which of these two machines did Drawbaugh talk and at which did you listen?

A. In 1869 he talked in that, [pointing to tumbler "F;"] I listened at "B," but it is not fixed at all as it was then.

Q. 69. Did the machine "B" then have this green tin tube?

A. Yes, sir; and also the lining inside.

Q. 70. Do you remember whether or not there was anything over the end of the tube next to the coiled wires?

A. It was a bladder over that, placed some way; it looked like a bladder.

Q. 71. Was there anything on it like these coiled wires which I now point to [indicating the electro-magnet]?

A. Yes, sir.

Q. 72. At the time, afterwards, when you saw this machine, marked "A," did you see this apparatus, marked "F," or anything like it?

A. I didn't at that time; that was done away with then.

Q. 73. How did you fix the time when you first saw these two machines marked "F" and "B?"

A. Well, I lived about a mile from Eberly's Mills, or from the machine shop, at that time—in '69; I moved spring of '70 to where I reside now—that is south of Shiremanstown—about two miles and a half from the shop now; I bought the property that spring; then after that I wasn't at the shop still for some time then.

PHONE COMPANY,-1

Q. 74. Do you mean that you bought the property where you now reside in the spring of 1870?

A. Yes, sir.

Q. 75. Did you take a deed of that property?

A. Yes, sir.

Q. 76. Have you that deed with you?

A. Yes, sir.

Q. 77. Will you please produce that deed in order that the examiner may certify the date of it? (Deed produced and handed to Mr. Storrow for examination.)

[*The examiner certifies that the deed is dated February the third, A. D.* 1870, *and is acknowledged the same day, it being a deed from Jessie Berkheimer and Eliza, his wife, to A. B. Shank, acknowledged before Joseph Leas, Justice of the Peace for Cumberland county, Pennsylvania, and unrecorded.*]

Q. 78. How long after the date of that deed did you move to the purchased land?

A. The same spring.

Q. 79. Now, am I to understand that before you moved on to that land you saw these two instruments, "F" and "B," and heard Mr. Drawbaugh talk through them, as you have testified?

A. Yes, sir.

Q. 80. About how long before you moved on to that land, to the best of your knowledge?

A. Nearly a year—near as I can say.

Adjourned until the following morning, at nine o'clock.

April 20, 9 A. M.

The examiner resumed.

Present, same counsel as yesterday, and also Mr. Chauncey Smith, for complainants.

Q. 81. Please examine the apparatus which I now show you, and which the examiner will mark with the letter "C," and state whether you ever saw it during any of your visits to Mr. Drawbaugh's shop?

A. I did. I saw this same time. I couldn't precisely set the time. I saw all those machineries of the first, and this was one of the first, and it was in about the same condition as it is now.

Q. 82. Then you saw this before you saw the instrument marked "A"—is that the fact?

A. Yes, sir.

Q. 83. Between the time when you moved to your present residence and the time when you saw the instrument marked "A," did you visit Mr. Drawbaugh's shop at all?

A. Yes, sir.

Q. 84. How frequently?

A. As near as I can state, about half a dozen times a year; some years oftener.

Q. 85. Prior to moving to your present residence, were you at Mr. Drawbaugh's shop more or less frequently than afterwards?

A. I was there pretty much all rainy days—that is, before I moved where I live now.

Q. 86. During any of your visits to Mr. Drawbaugh's shop, as you have testified, did you at any time see the device which I now hand you, and which the examiner will please mark with the letter "I" and his initials.

A. Yes, sir; I saw this different times about the—about his other machineries.

Q. 87. What do you mean by "about his other machineries?"

A. Well, he would show me his other patterns,—well, he would show—he still working at other machineries.

Q. 88. Other machineries for that?

A. Well, he was working at this here telephone, or what you might call it—speaking machine, he called it.

Q. 89. What is your impression as to the time when you saw the apparatus marked "I," which you hold in your hand?

A. Well, I couldn't—couldn't hardly set the time on this.

Q. 90. At any time when you were at Mr. Drawbaugh's shop, as you have testified, did you speak through the instrument while he listened?

A. Yes, sir; sometimes.

Q. 91. When was that?

A. Well, I couldn't fix the date on that. Some time in '73 and '74, to the best of my knowledge.

Q. 92. Is there any instrument here, in your sight, that was used at the time when you spoke and he listened?

A. Well, I hardly can identify more than that tumbler and the green box he had at the same time he was talking through it.

Q. 93. Do you remember whether or not the instrument marked "A" was used by him or by you when you were speaking and he listening?

A. It was used by him when he was listening, at the time, and also I tried to listen at the other machine, or rather at another machine; I couldn't identify which one it was.

Q. 94. Did you at any time use this machine marked "A" for listening?

A. Yes, sir.

Q. 95. When was that?

A. Well, I can't just set the time, or remember when it was. He had different machines.

Q. 96. How many times did you see this instrument marked "A" in use at his shop?

A. Well, I couldn't recollect; about a couple of times.

Q. 97. You stated yesterday that the first time when you saw this instrument marked "A" in use was about the time when the axle company commenced business at the place. Could you state any more definitely whether it was just before or just after they commenced business?

A. It was just about that time, or rather a little before.

Q. 98. You have stated that this instrument marked "A" was used at one time, when you were present, by Mr. Drawbaugh to speak into; and, again, you have testified that it was used at one time to listen at; state whether you are, or are not, sure about its being used both for speaking into and for holding to the ear to listen at?

A. Well, I was wrong; I know that I had it to my ear. After I thought over it, as I had that to hold to my ear. After I studied over it, I knew that was the one I listened at.

Q. 99. State whether anybody suggested to you that you were wrong in saying that the instrument marked "A" was used to talk into, or did your memory correct you without any suggestion from others.

A. Without any suggestion at all from any others.

Q. 100. You testified yesterday that, at one time, Mr. Drawbaugh made some remark about means—if he had the means—or something to that effect; please state all that you heard him say at any time when he was showing you the talking-machines, or speaking about them, that had reference to his pecuniary means or want of means?

[*Objected to by Mr. Storrow as incompetent, on the ground that it is an attempt to substitute a party's statement of a disputed fact for proof of the fact itself.*]

A. Well, he said he hadn't the means to go on with this machineries except some person or some parties would go in with him.

Q. 101. When did he say that?

A. Well, that I couldn't set no time. He said that frequently.

Q. 102. How long ago did he say it?

A. Well, really I couldn't set no time; but he has, when he was working at these telephones—speaking machines, though, he called it.

Q. 103. What I want to know is whether such remarks were made by him during the time about which you have been testifying—that is to say, from 1869, when you first saw the talking-machines, till you saw the machine marked "A" about the time when the axle company went into operation—was it during that four or five years of time or was it more recently that he made the remark about want of means and about getting others to go in with him?

A. It was between that time. I can't specify the particular time; it was during that time.

Q. 104. What do you know about Mr. Daniel Drawbaugh's pecuniary circumstances from 1869 to the summer of 1880?

A. Well, I know a good bit about them with regard to collecting taxes. I collect State and county tax, or taxes, and school tax, any—well, ever since that time from 1869 to 1880, in Lower Allen township, where I reside now. I have collected some executions off of him, too, and other bills as I had a great deal of trouble to collect them, as he said that he hadn't the means to pay them, and to keep me in good spirits he used to show me those instruments. I rather thought it was done for me to give him still more grace on them for to collect the taxes and bills.

Q. 105. Explain how you used to get his taxes out of him during that time?

A. Well, he would give me bills to collect, and I would collect them—those could be collected—and I would take the best part of that money to pay off other bills and taxes.

Q. 106. What were those bills for, which he gave you to collect?

PHONE COMPANY,-1

A. Well, there were bills for some machineries, pumps, or something of the kind, that he had done for parties. I know of several bills,--this was labor I suppose as he put out. Well, jobs as he put out--sold machines for those bills, I suppose.

Q. 107. Was he in the habit of doing little repairing jobs, and other work of that kind for the people of that vicinity?

A. Yes, sir.

Q. 108. What was his general condition as to ready money during that time, when you would call on him to collect tax bills or other bills from him?

A. I never saw no money from him hardly. Once in a while a dollar or two. The rest I could get out of bills and so forth. He always stated as he had no money. Well, I had to wait till he gets some means of getting it, or rather, some way of making money. Then I had several executions that I paid myself and I have waited him till he gave me bills, and I got my money out of him that way.

Q. 109. How large were these executions that were in your hands against him?

A. Well, really, I can't just say how large they were. I have one here now, an execution against Daniel Drawbaugh in favor of James D. Scott, for the total sum of seventeen dollars and fifty-four cents, including costs. The first payment on it was June 26, 1879, ten dollars, and I paid the execution off myself. Afterwards he give me five dollars. I have no date on that, and the balance due to me is two $\frac{54}{100}$ dollars yet.

Q. 110. The executions which you held against him for collection were on judgments of justices of the peace, were they not?

A. Yes, sir.

Q. 111. Do you know whether or not any of these executions were for groceries, clothes, doctor's bills or other necessary supplies for his family?

A. I could not state that. I do not recollect that—what they were for. Bills that I collected I know of some that were for necessaries.

Q. 112. How long have you held the office of constable of your township?

A. Since '66 I have been in regular every year. Two years before that I was in—'63 and '64—'65 I was out.

Q. 113. Is the office filled by election of the people from year to year?

A. It is.

Q. 114. What are your politics?

A. I am a Republican.

Q. 115. Which political party has been in control in your township during that time?

A. Well, the Republicans had a little majority till '69, or say '70, and since then the Democratic party controlled, and they did sometimes before that.

Q. 116. Then during that time, from '70 till the present time, have you held your office by the votes of people opposed to you politically?

A. Yes, sir.

Q. 117. In your testimony yesterday (Ans. 68) referring to the machine marked "B," you spoke of it as being "not fixed at all as it was then." Please explain more fully how it differs now from what it was then. What is there about it that is different?

A. Well, I hardly can explain it. I might say the bottom is torn out, and this thing (indicating the electro-magnet) isn't put together as it was then. It's the tin box,—as near as I can identify, it is the same box,—the same green color.

Q. 118. Was the electro-magnet then of the same size as that now on the instrument, to the best of your recollection?

A. It was, but it wasn't as big as it is now, that is, it is expanded out,—torn up.

Q. 119. Do you refer to the wire being now loose on the spools?

A. Yes, sir.

Q. 120. From the time when the axle company started up, down to the summer of 1880, were you at Daniel Drawbaugh's shop? If so, how frequently?

A. I was there; I couldn't tell you just how often. I was back and forwards probably six or seven times a year, perhaps oftener.

Q. 121. During that time, did you or did you not see other talking-machines at Mr. Drawbaugh's shop?

A. I did not—that is, not at that time. I might have seen it 1875. Since that he hasn't showed me any to my best recollection.

Cross-examination by Mr. Storrow:

Cross-Q. 122, *de bene.* You testified in your direct examination about some remarks that Drawbaugh made you as to want of means. I wish you would tell me all that he said on that subject at any time.

A. Well, I really couldn't say all that he did say. He said a good bit about means—that he hadn't the means.

Cross-Q. 122½, *de bene.* Tell me all that you remember that he said on that subject.

A. Well, he said he hadn't the means to go ahead with those machines; also, he couldn't pay no taxes or anything that way.

Cross-Q. 123. What did he mean by the phrase "go ahead with those machines?"

[*Objected to by Mr. Hill as incompetent, by reason of calling for witness' opinion as to the meaning of Mr. Drawbaugh's language.*]

A. Well, I don't know myself what he meant as regards to go ahead; it meant that he hadn't the means, I suppose.

Cross-Q. 124. Did he make any talk of this kind to you the first time he showed you the glass-tumbler instrument "F" and the green tin instrument "B"?

A. I don't think he did.

Cross-Q. 125. When was the first time you remember his making any talk of this sort with you?

A. Well, I can't hardly state that. Some time between '73 or '74. It might have been before, but that is the best of my recollection.

Cross-Q. 126, *de bene.* Was not the time when he showed you the instrument "A" the first time when he made that kind of a remark to you, which you recollect?

A. Well, it was about that time—yes.

Cross-Q. 127. Look at all the instruments which have been referred to in your deposition, and which are now on the table, and tell me which is the first one of them that you ever saw.

A. Well, I saw the glass tumbler "F," also the green-painted box "B."

Cross-Q. 128. Which was the next one you saw?

A. The one marked "C." That was just as it is now.

Cross-Q. 129. Which is the next one you saw?

A. I saw instrument marked "A."

Cross-Q. 130. And the next?

A. Well, for that part, I saw "I," but can't set no time when I saw it.

Cross-Q. 131. Do you remember whether you saw "I" after "A" or before it?

A. That I can't recollect. I saw those machines different times.

Cross-Q. 132. Did you first see "I" after you saw "C" or before it?

A. I recollect seeing "C" before I saw "I."

Cross-Q. 133. When did you see "C" the first time?

A. Indeed I can't just recollect the exact time.

Cross-Q. 134. Tell me as near as you can recollect.

A. Well, as near as I can recollect, I really can't state more as between '70 and '74 I saw all them machines.

Cross-Q. 135. I suppose you mean to include the year '74 in your last answer; you don't mean that you saw them all before the year '74 began?

A. I mean in '74; that is about the last time I saw them—in '74, or about that time.

Cross-Q. 136. I call your attention to the little loose piece of tin that plays in a notch under the small block of wood in instrument "B." I suppose you remember seeing that little piece of tin there when you first saw the instrument in 1869, don't you?

A. I did not. I don't remember. I didn't look that close or examine, and, aside from that, the machine ain't like it was at that time.

Cross-Q. 137. Did you hold it in your hand when you listened at it, or was it fastened up to the wall?

A. It was standing on a table.

Cross-Q. 138. When you first saw this instrument "B" and the glass tumbler "F," which you have testified was in 1869, who was in the room with you?

A. Daniel Drawbaugh.

Cross-Q. 139. What kind of manufacturing business was going on in this shop at that time?

A. Faucet—the first faucet manufacture.

Cross-Q. 140. Who were the people who formed that first faucet manufacturing company?

A. Daniel Drawbaugh was the inventor, and the company, I really don't know who all was in. If I am not wrong, William R. Gorgas was one, and John F. Hursh and Joseph Hursh and Dr. M. B. Mosser, Henry S. Rupp, John Sheely. That is all of the party I can think of. There might have been others. Dr. M. B. Mosser, I think, was treasurer. He paid the taxes on the machine shop.

Cross-Q. 141. Daniel Drawbaugh was the superintendent of that company, and superintended the manufacture of their faucets at that time, didn't he?

A. That I don't know; I would suppose so. He also told me he had a share in it—just the same as a share.

Cross-Q 142. What kind of business was being carried on at his shop at the time you saw the instrument "C" there?

A. Well, to the best of my recollection it was the faucets at that time. They were in operation.

Cross-Q. 143. You said you saw the tumbler "F" and the green-box instrument "B" for the first time in 1869. When did you next see them?

A. Well, I didn't see them 'till in about July, '80, as near as I can state that.

Cross-Q. 144. Where did you see them in July, '80?

A. Mr. Chellis and Mr. Jacobs they came asked me if I knew anything about any instrument that Daniel Drawbaugh had, for to talk through or speak through, I don't know which of them words; I forget that. I told them I did, before I moved where I reside now. They asked me also whether I would know any of those instruments. I told them if they had the glass tumbler, and the tin box, I call it, I believe I could recognize very well. Then they showed me both those machines.

Cross-Q. 145. Did they show you any other models or machines at that time?

A. Well, yes, they showed me other machines; I think it was that time; they were several times with me.

Cross-Q. 146. On one of those occasions did they show you the machines now on the table, and which you have testified about?

A. Yes, sir, they showed me "A" and "C."

Cross-Q. 147. How often had you seen "C" between the time you first saw it, and this occasion in the summer of '80?

A. Well that—really I couldn't give you any definite answer on that. I saw that standing on the bench several times; I really couldn't recollect how often I did see it; I saw it several times before I saw Chellis and Jacobs and Daniel Drawbaugh taking it around.

Cross-Q. 148. Tell me as near as you can, in what years you saw it?

A. Well as near as I can; I can't come down to the years; it was between '70 and '74.

Cross-Q. 149. You testified that you saw instrument "A" about the time the axle company commenced operations. Did you see it between that time and the time Mr. Chellis and Mr. Jacobs showed it to you last summer?

A. I saw that about the time, or rather a little before the time, that the axle company got into operation; I did not to my recollection see it between that time and the time last summer, when Mr. Chellis and Mr. Jacobs showed it me.

Cross-Q. 150. When did you last see instrument "I" before to-day?

A. I couldn't give no time—not at all, that I saw it.

Cross-Q. 151. Have you seen it within the last five years before to-day?

A. No, sir.

Cross-Q. 152. Was the manufacturing business of the axle company carried on at Mr. Drawbaugh's shop?

A. Yes, sir.

[*Recess for dinner.*]

Cross-Q. 153. When you first saw glass tumbler "F" and green tube instrument "B" did Mr. Drawbaugh talk into the machine, or sing into the machine?

A. I don't know what you might call it. He doodle, doodle, doodle, and afterwards he talked, and asked me whether I heard it or understood it.

Cross-Q. 154. I suppose you understood what he said through the machine, didn't you?

A. I understood when he asked me whether I heard it.

Cross-Q. 155. You mean that when afterward he told you what he had said through the machine and asked you whether you understood it, you told him yes, is that what you mean.

A. Yes, sir.

Cross-Q. 156. How far from the office of the notary, Mr. Ott, in Harrisburg, is Drawbaugh's shop at Eberly's Mill?

A. About four miles.

Cross-Q. 157. When did you last talk with Mr. Drawbaugh about any telephone or talking machine, before the time when he and Mr. Chellis and Mr. Jacobs came to you last summer?

A. It was, to the best of my recollection, between '73 and '75.

Cross-Q. 158. And is it your recollection that you had no talk with him about any telephones or speaking machines between '75 and the summer of '80?

A. Not as I know of.

Cross-Q. 159. Were you in the habit of reading any of the Harrisburg papers between '75 and '80.

A. No, sir.

Cross-Q. 160. Were you in the habit of reading any newspaper between '75 and '80?

A. Yes, sir.

Cross-Q. 161. What papers?

A. Carlisle *Herald* I am getting for the last eighteen years, and the Mechanicsburg paper; I don't recollect the name; I have been getting off and on. I get the *Mirror* from Carlisle, too.

Cross-Q. 162. I suppose that you knew before last summer, that there were such things as speaking or talking telephones in use in the community, didn't you?

A. Yes, sir.

Cross-Q. 163. You have testified that in the summer of 1880, Mr. Drawbaugh, Mr. Chellis, and Mr. Jacobs saw you on several occasions and talked with you about Drawbaugh's talking machine, did you at any time last summer make an affidavit or deposition for them as to what you knew about Drawbaugh's machine?

A. I did.

Cross-Q. 164. Who wrote the affidavit, and where was it written?

A. I really don't know if Mr. Jacobs or 'Squire Bowman wrote the affidavit; I think though, it was Mr. Jacobs, the first time.

Cross-Q. 165. Did you make a second affidavit, at any time, for Mr. Jacobs or Mr. Chellis?

A. Yes, sir.

Cross-Q. 166. When was that second one and who drew it?

A. It was in the fall, some time in 1880; I think Mr. Jacobs wrote that too, although 'Squire Bowman was along at the same time.

Cross Q. 167. Was it in October when you made that second one?

A. I can't recollect that; I don't know just rightly what time; it was in the fall.

Cross-Q. 168. Did they tell you what they wanted the first one for?

A. They did, but I can't recollect what they did say about the first one.

Cross-Q. 169. Did they tell you what they wanted the second one for?

A. Not as I know; not to my recollection; all they said they were going around taking depositions again.

Cross-Q. 170. Didn't they tell you they were going to use them in a suit?

A. . No, sir; not as I know.

Cross-Q. 171. Who was the first person who spoke to you about making an affidavit?

A. Mr. Jacobs.

Cross-Q. 172. Did he afterwards give you any reason why they wanted a second one?

A. No, sir; not as I know.

Cross-Q. 173. When did you see last the first affidavit?

A. I didn't see it at all from the time they took it.

Cross-Q. 174. When did you see last the second affidavit?

A. I haven't saw it since they took it.

Cross-Q. 175. Was the second one exactly like the first?

A. That I don't know.

Cross-Q. 176. Was the second one brought to you all written out, or was it taken down from your lips?

A. It was taken down, to the best of my recollection—written down at the same time that they were there, as I stated it to them.

Cross-Q. 177. Then the second affidavit wasn't a copy of the first, was it?

A. Not as I know of.

Cross-Q. 178. Who did you swear to it before?

A. Henry N. Bowman.

Cross-Q. 179. Whom did you swear to the first one before?

A. Henry N. Bowman; I think that was the man.

Cross-Q. 180. Who have you talked with about this case since you began to testify yesterday afternoon?

A. I can't tell you; we have talked, different ones; it was, that I am a witness, as regards subpœnaing those witnesses for our court at Carlisle.

Cross-Q. 181. Who have you talked to about this telephone case, since you began to testify in it, yesterday afternoon?

A. I haven't talked with any person, more than I said I was a witness in Daniel Drawbaugh's case.

Cross-Q. 182. Who have you talked with about any of Daniel Drawbaugh's instruments, since you began to testify yesterday afternoon?

A. I haven't talked with anyone that I know of.

Cross-Q. 183. I suppose you knew last summer that speaking telephones were in use in Harrisburg, didn't you?

A. I did not.

Cross-Q. 184. When did you first learn that speaking telephones were in use in Harrisburg?

A. I never learned it; didn't know it.

Cross-Q. 185. Did you ever know that speaking telephones were in use anywhere in the world?

A. Yes, sir.

Cross-Q. 186. How did you learn that?

A. Well, they had telephone or speaking machine at Williams' Grove; I think I saw one.

Cross-Q. 187. When did you see that?

A. When the pic nics were there; I couldn't just tell what month rightly.

Cross-Q. 188. What year?

A. 1880.

Cross-Q. 189. Was it before Mr. Chellis and the others came to you last summer, or after?

A. It was after that.

Cross-Q. 190. Was that the first time you ever knew there were such things as speaking telephones?

A. No, sir; it wasn't the first time.

Cross-Q. 191. What was the first time?

A. Daniel Drawbaugh was the first I heard speak about the telephone or speaking machine.

Cross-Q. 192. When did you first hear of the existence of any telephone, other than the instruments which you say you saw at Drawbaugh's?

A. In '80; I heard them talking about another telephone.

Cross-Q. 193. Who did you hear talking?

A. I couldn't recollect.

Cross-Q. 194. When did you hear anybody have that talk?

A. That was last summer, in '80.

Cross-Q. 195. What time in the summer?

A. I don't recollect.

Cross-Q. 196. Was it before or after Mr. Chellis came to you with Mr. Jacobs?

A. I really couldn' recollect that.

Cross-Q. 197. Was it before or after you saw the telephone at Williams' Grove, or was that the first you heard of it during the year 1880?

A. I couldn't say if it was the first or not.

Re-direct examination by Mr. Hill.

Q. 198. When Mr. Drawbaugh spoke to you through the machine, before you moved to the place where you now live, did you hear and understand what he said through the machine, so that you knew what he said, before he afterwards asked you about it, after laying the machines down?

A. Yes, sir.

Q. 199. When, a long time afterwards, namely, about the time the axle company began operations, he talked at the instrument up stairs, and you listened with an instrument at your ear, on the floor below, did you then understand, through the machine, what was said, so that you knew what he said, before he appeared and stated what it was?

A. Yes, sir.

Q. 200. When he sang through the machine to you, and you heard the singing, and he asked you whether you heard it, did he ask you through the machine whether you heard it, or did he ask you without the aid of the machine, whether you heard it?

A. He asked me through the machine.

Q. 201. Did you hear and understand what it was he was asking you through the machine?

A. Yes, sir.

Q. 202. When Mr. Jacobs took your two affidavits, as you have testified, were they read over by you, or to you?

A. They were read to me after that.

Q. 203. At the time you signed them?

A. Yes.

Q. 204. Were they written down in your presence, as you stated the facts to Mr. Jacobs?

A. Yes, sir.

Q. 205. Who read them over to you, Mr. Jacobs or the magistrate who administered the affirmation?

A. The magistrate.

Examination taken, reduced to writing, and affirmed to and subscribed before me as above set forth.

FRED. M. OTT,
Examiner.

April 20, 1881.

ABRAHAM B. SHANK.

JAMES BROOKS, *being produced, affirmed and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and present occupation.

A. My age is sixty-eight years; my residence is Shiremanstown, Cumberland county; I am a millwright by occupation; at present I am working for the Harrisburg Car Company.

Q. 2. Did you at one time work in the grist-mills at Eberly's Mills, Cumberland county, Pennsylvania?

A. I did.

Q. 3. Can you state the time when you commenced work and the time when you finished your work at said grist-mill?

A. I commenced work there on the sixteenth of December, 1873; I finished the work on the thirty-first of March, 1874.

Q. 4. During the time you were working in said grist-mill, as stated, did you visit the shop of Daniel Drawbaugh at Eberly's Mills, and, if so, how often?

A. I visited the shop; I couldn't tell you how often—I didn't keep any account of that—several times.

Q. 5. I now exhibit to you two instruments, one partially of glass and marked "F," the other partially of metal and marked "B," and ask you whether you saw either of those instruments during any of your visits to Mr. Drawbaugh's shop while you were working in the grist-mill, as stated by you?

A. I saw both of them.

Q. 6. Did Mr. Drawbaugh, at the time, explain those instruments to you and tell you what they were for?

A. He did.

Q. 7. What did he say they were for?

A. For talking in and hearing at a distance.

Q. 8. Did he, at that time, tell you what they were operated by ?

A. Operated by electricity, he told me.

Q. 9. Did you see any batteries connected to them?

A. Not that I recollect.

Q. 10. Did you hear any talk or conversation through the machines at that time?

A. I did.

Q. 11. Where were the two machines while this conversation was carried on through them?

A. This one [indicating machine marked "B"] was on the third floor, or floor next the garret of the shop; this one [indicating machine marked "F"] was on the lower floor.

Q. 12. Which floor do you mean by the lower floor?

A. The ground floor.

Q. 13. Am I to understand that there were two floors or stories between the two instruments?

A. There were two floors between the two instruments.

Q. 14. How were the two instruments connected?

A. By two wires, wrapped with something—I don't know what.

Q. 15. Where were you when you heard the conversation carried on through the instruments?

A. I was on the the third floor that this instrument [indicating "B"] was on first, and afterwards I went down below to hear Mr. Drawbaugh speak.

Q. 16. When you were on the third floor at the instrument marked "B," did you hear any words through it?

A. I did.

Q. 17. Who was speaking at the other instrument?

A. A small boy.

Q. 18. Did you understand through the instrument what he said?

A. I did.

Q. 19. Did you understand through the instrument the peculiarity of his voice, so as to distinguish it as a boy's voice, from the voice of a man ?

A. I did.

Q. 21. Can you now remember any of the conversation, or words that were spoken through the instrument?

A. I do not remember any.

HONE COMPANY,-1

Q. 22. From the position where the boy was and where you were, could you have heard anything the boy said, except by the aid of the instrument?

A. You might have heard a very loud scream, but not to have understood anything.

Q. 23. At which end of the instrument did you place your ear when listening?

A. Here, [indicating the end of the tin tube farthest from the electro-magnet, in the instrument marked "B."]

Q. 24. Was there at that time anything on the end of the tin tube next to the coil, and if so, what?

A. There was what I took to be at that time oiled tissue paper—oiled with linseed oil—over the end of the tube, [pointing to the end of the tube next to the coil;] it was white tissue paper.

Q. 25. Were the instruments at that time lined with a white substance, as they appear now to have been?

A. Yes, sir.

Q. 26. Did Mr. Drawbaugh, at that time, tell you what that lining substance was, and what it was there for?

A. He told me the substance was plaster of Paris, and it was there to prevent echo.

Cross-examined by Mr. Smith:

Cross-Q. 27. How far is your present residence from here and from Eberly's Mills?

A. My present residence from here, we call it five miles, and from Eberly's Mill, two and a half.

Cross-Q. 28. Did you reside in the same place when you were at work in Eberly's Mills in 1873 and 1874?

A. I did.

Cross-Q. 29. And have you resided there ever since?

A. I have.

Cross-Q. 30. And you have known Mr. Drawbaugh all the time, I suppose?

A. I have known him from a child.

Cross-Q. 31. You have been, I suppose, to his place a great many times, both before and since you worked at Eberly's Mills, as you stated before?

A. Yes, sir, I have been there frequently.

Cross-Q. 32. You didn't make any memorandum of this particular occasion when you saw these instruments, did you?

A. My answer to that would have to be too lengthy. For a number of years I have worn glasses all the time, and by bad luck I broke the frame about an inch from the glass, and I went down to get him to mend it in some shape; he fixed it for me; I had some trouble to get him at it, because he was working with these instruments at the time; that is the way I remember the circumstance, I was in a hurry to have it done.

Cross-Q. 33. Did you ever talk with him about them afterwards?

A. I did.

Cross-Q. 34. When was that, and what did you say?

A. One time, I am not able to tell you, I couldn't give you any dates, I recollect of asking him how he was getting along with it; he told me that there was something in it, but he says, "I am too hard up to do what I would like to."

Cross-Q. 35. Can't you give some idea when this was?

A. I could not be positive. If my mind serves me right, it was while I was working at the mill; but I am not sure of it.

Cross-Q. 36. When did you next speak to him about it?

A. I can't fix any time.

Cross-Q. 37. Can you remember what he said about it at any other time?

A. I heard him say several times he would like to make something out of it.

Cross-Q. 38. You thought it would be a very important invention, if perfected, did you not—something very wonderful?

A. I hardly know how to answer that. I didn't look at it of as much importance then as I do now.

Cross-Q. 39. When did you next see the instruments themselves?

A. After I left the mill, I did not see them until last fall or winter some time; I couldn't give you the date when I saw them. Mr. Drawbaugh asked me some time last fall to describe the instrument to him before I saw them, and I did so.

Cross-Q. 40. When and where did you see the instrument after that conversation with Mr. Drawbaugh?

A. Some time last winter in the hotel at Shiremanstown.

Cross-Q. 41. And who was present?

A. Mr. Drawbaugh, Mr. Jacobs, and Mr. A. J. Railing.

HONE COMPANY,-1

Cross-Q. 42. What was done there?

A. These instruments were shown to me, and we talked about them.

Cross-Q. 43. They are not now, of course, in the same condition that they were when you first saw them?

A. No, sir.

Cross-Q. 44. Did you know last winter that speaking telephones had been widely introduced into use in Harrisburg and other places?

A. Personally I did not; but, by reading papers and by rumor, I thought it was so.

Cross-Q. 45. How early did you know of their being used, either by reading or by rumor?

A. That is a question I can't answer.

Cross-Q. 46. Can't you say whether you had heard of them, or read of them, one, two, or three years before last winter?

[*Objected to by Mr. Hill as immaterial and as not in cross-examination on any matter referred to in the direct.*]

A. I can say I heard of them before last winter, but how long I don't know.

Cross-Q. 47. In what papers had you read of them?

[*Same objection.*]

A. I read of them in the Harrisburg *Independent*, Carlisle *Herald*, Carlisle *Volunteer*, Harrisburg *Telegraph*, and different other papers.

Cross-Q. 48. After you saw the instruments the first time, did you speak about them to any one besides Mr. Drawbaugh?

A. I did.

Cross-Q. 49. To whom?

A. It was the topic of conversation in a good many places and I wouldn't be able to name but few whom I spoke to; John B. Drawbaugh, A. B. Shank, Henry M. Rupp, Jacob Rupp, M. P. Dill, A. H. Dill, and others.

Cross-Q. 50. Why didn't you look at the matter as of as much importance then as you do now?

A. Because I didn't know as much about it.

Cross-Q. 51. You knew just as much about the instruments then as you do now, didn't you?

A. I did.

Cross-Q. 52. And what you know now, which you didn't know then, relates to the instruments which have been brought into general use, does it not?

A. It does, but still my knowledge of them is limited.

Re-direct by Mr. Hill:

Q. Q. 53. You knew, then, that Daniel Drawbaugh had an instrument with which, by means of electricity, a person could talk to a distance and his voice be heard and words understood at a distance, did you?

[*Objected to by Mr. Smith as being leading.*]

A. With electricity, or rather about electricity, I would say I know but little, but Mr. Drawbaugh told me they worked by electricity—his instruments—and words could be heard at a distance.

Q. Q. 54. You knew that spoken words could be heard at a distance by means of those instruments which you saw, and through which you heard conversation, as you have testified, did you?

[*Same objection.*]

A. Yes, sir.

Q. Q. 55. But you did not then appreciate as you do now the greatness of the invention and its commercial value—is that the fact?

[*Same objection by Mr. Smith.*]

A. I did not appreciate it then as I do now.

Re-cross by Mr. Smith:

Re-cross-Q. 56. The distance which you refer to in your last answers was the distance from one floor to the second floor above, was it not?

A. Yes, sir.

Re-cross-Q. 57. How did you go from one of those floor to the other?

A. By stairs.

Re-cross-Q. 58. Did the stairs open up on the floors that you spoke of?

A. At the top of each pair of stairs there was a door.

Re-cross-Q. 59. How large is that building?

A. Now you bring me to guess-work if I must answer that question. I have no measurements. We were speaking of that to-day, and I put it down as fifty feet long, and I was told it was forty feet long, and I suppose it is thirty feet wide.

Re-direct by Mr. Hill.

Q. Q. 60. With whom were you speaking about that to-day?

HONE COMPANY,-1

A. Mr. Drawbaugh.

Q. Q. 61. To the best of your recollection, how far would you say it was from the instrument "B," at which you listened, to the instrument "F," into which the boy talked?

A. It was over fifty feet, I guess; I would think so.

Examination taken, reduced to writing, and affirmed before me this 20th day of April, 1881, and subscribed to.

FRED. M. OTT,
Examiner.

JAMES BROOKS.

April 21, 9:30, *A. M.*

Met pursuant to adjournment.

Present, Mr. Smith, for complainants, and Mr. Hill, and Mr. Jacobs for respondents.

JOHN J. ZACHARIAS, *being produced, affirmed, and examined, saith:*

Q. 1. State your age, residence, and occupation.

A. Age, forty-one; residence, Siddonsburg, York county, Pennsylvania; by occupation a miller.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania?

A. I do.

Q. 3. I exhibit to you the two machines marked "B" and "F," and ask you whether you ever saw them before, and if so, when and under what circumstances you saw them?

A. I did see them, and seen them at his shop, and the exact time I couldn't exactly tell, but it was between '70 and '74—rather earlier than '70 than later than '74.

Q. 4. Is there any circumstance connected with your first seeing them which may aid us to fix the time with more certainty?

A. There is.

Q. 5. State what it is.

A. I went there to buy what is called Drawbaugh's patent tram for leveling mill-stones, and at that time there was two sets of mill-stones put into the mill—the year that I seen this. Judge H. G. Mosser was acting as agent, Joseph Stretch as mill-wright.

Q. 6. In what mill were those two sets of stones put that summer?

A. In a mill belonging to Ross' heirs, or Mrs. Ross, at New Cumberland. It was called New Cumberland mills.

Q. 7. Were you at work at the New Cumberland mills at the time?

A. Yes, sir.

Q. 8. As miller?

A. Head miller.

Q. 9. From what time to what time did you work at the New Cumberland mills.

A. From the fall of '68 to the spring of '76.

Q. 10. Were those the only mill-stones that were put in those mills from the fall of '68 to the spring of '76, or not?

A. They were.

Q. 11. Why did you need the tram at that time?

A. To face and level off the new mill-stones.

Q. 12. When you visited Mr. Drawbaugh's shop on that errand, how came you to see the two instruments marked "B" and "F?"

A. He showed me that in company with other inventions that he was working on at that time.

Q. 13. Did he state to you at that time what those two instruments, "B" and "F," were for?

A. He did.

Q. 14. What did he say they were for?

A. He called them his talking machines.

Q. 15. Did he show you their operation?

A. Yes, sir.

Q. 16. Tell us all about it, what you did with them, and how.

A. This machine here [indicating machine marked "B"] was in his office in the shop: this here [marked "F"] was up stairs. "Now," says he, "just wait here, and I'll go up-stairs and talk in the machine," and so he went up stairs, and spoke, and then afterwards came down and took me up, and showed me machine marked "F."

Q. 17. While he was talking in the machine up-stairs, did you listen at the machine in the office?

A. I did.

Q. 18. State whether or not you heard, and understood, through the machine what he was saying up-stairs?

A. I did.

Q. 19. State whether you did or did not, through the machine, hear the peculiar tones of his voice, so as to distinguish it as Mr. Drawbaughs's voice?

A. I understood his voice distinctly and recognized it.

Q. 20. How did it sound, as compared with his voice when speaking in your presence?

A. The same, only not so harsh, I thought.

Q. 21. When he was speaking in the machine up-stairs, and you listening at the machine in the office, could you have heard what he said, except through the machine?

A. No, sir, not in the tone that he spoke.

Q. 22. Do you remember whether the machine at which you listened, and the machine into which he spoke, were connected in any way, and if so, how?

A. They were connected; with what kind of material, I can't say, exactly, but if my memory serves me right, it was material covered something like that there [pointing to the wrapped wire on the electro-magnet of machine marked "B"] is; this here ("B") was on the work-bench in the shop, and then the wires, or cords, or whatever they were, passed out through the partition, and were connected with this machine [indicating machine "F"] up-stairs.

Q. 23. When you listened, in the office, at this machine, marked "B," at which end of the tin box did you place your ear?

A. At this one, [indicating the end farthest from the electro-magnet.]

Q. 24. Do you remember whether or not the other end of the tin-box was covered with anything at the time?

A. It was.

Q. 25. What is your recollection, as to the material with which it was covered?

A. I can't tell exactly, because it was wrapped in the manner that it is there, and, if anything, it was farther from me; I was positive that it was covered, but did not examine what kind of material; the cover was on the end opposite to the end that was towards me.

Q. 26. By "wrapped in the manner it is there," do you refer to the strings or threads, around the end of the box?

A. Yes, sir.

Q. 27. What were those strings or threads for?

A. I had supposed, to hold the end—to fasten the material that it was covered with—the cover.

Q. 28. Did Mr. Drawbaugh, at that time, say anything about what he could do with his invention—to what distance he could talk with it and hear through it; if so, what did he say?

A. He said he could run it out for miles, and parties could talk in at the one end, and be heard at the other end, the same as persons in a room together.

Q. 29. Did he make any comparison between it and telegraphing, and if so, what did he say about it?

A. He said it would eventually take the place of telegraphs.

Q. 30. Did he say anything about getting a patent upon it, and if so, what did he say?

A. He told me that he hadn't the means, but that as soon as ever he got the means, he was going to have it patented.

Q. 31. During the time you refer to, from 1870 'till into 1874, what was his his pecuniary condition, so far as you know?

A. Hard up for money.

Q. 32. What firm was running the New Cumberland mills at that time?

A. A firm styled Zacharias & Co.

Q. 33. Who were the parties composing that firm?

A. Samuel Zacharias, Sr., Samuel Zacharias, Jr., and Eli Graybill.

Q. 34. State whether or not, during that time, Mr. Drawbaugh was indebted to that firm?

A. I suppose he was, for Samuel Zacharias, Jr., gave me orders not to give him anything unless he had the money.

Q. 35. Did you understand at the time that Mr. Daniel Drawbaugh was indebted to the firm?

A. I did.

Q. 36. For what?

A. For coal and flour.

Q. 37. Did you know what Mr. Daniel Drawbaugh's general reputation was in the community where he lived for truthfulness and honesty—the payments of his honest debts, so far as he was able to do so?

A. As a citizen and neighbor, he has always been respected. Among the business men, of course, he was not liked so well, merely on account of his not having the money to pay his debts. He would have paid them if he had had it.

Cross-examined by Mr. Smith:

Cross-Q. 38. How far is New Cumberland mills from Mr. Drawbaugh's place at Eberly's Mills?

A. Not over three miles.

Cross-Q. 39. How long, in all, did you live at New Cumberland mills?

A. From the fall of 1868 to the spring of 1876.

Cross-Q. 40. How long have you known Mr. Drawbaugh?

A. Fifteen or eighteen years.

Cross-Q. 41. How near to him did you live before '68?

A. Mechanicsburg, a distance of about six miles.

Cross-Q. 42. After '76, how near to him did you live?

A. For two years, about two miles from him, and, from that time up to the present, about six miles or more. I have lived at Siddonsburg about a year, and that is more than six miles.

Cross-Q. 43. Were you ever at Mr. Drawbaugh's place on any other occasion than the one which you have spoken about to-day?

A. Yes, sir.

Cross-Q. 44. How often?

A. Once.

Cross-Q. 45. And only once?

A. That is, if I am not mistaken. The reason I remember of that is this, I went there to buy a cider mill.

Cross-Q. 46. A cider mill of Mr. Drawbaugh?

A. Yes, sir.

Cross-Q. 47. Did he manufacture cider mills and these instruments that you call trams?

A. He manufactured the tram—kept them for sale—but the cider mill he had put up for his own use and run it there at his shop, and I bargained for it as second-hand.

Cross-Q. 48. What did you pay him for it?

A. I don't remember the exact price.

Cross-Q. 49. State as nearly as you can what you gave him for it, and at what time you bought it.

A. He wanted fifty dollars for it, and I got it for less. It was in the fall of 1876.

Cross-Q. 50. What other things did he manufacture or sell, or have for sale at the time you bought the tram?

A. He had what was called Drawbaugh's patent faucet there, that then I think belonged to Hauck & Co.

Cross-Q. 51. Were there men at work there manufacturing any articles?

A. No, sir.

Cross-Q. 52. At the time you bought the cider mill, was there any business carried on there?

A. There was the manufacturing of axles, to a small extent, carried on there.

Cross-Q. 53. Are you a relative of either of the members of the firm of Zacharias & Co.?

A. A son of Samuel Zacharias, Sr.

Cross-Q. 54. What other inventions did Drawbaugh show you which he was working on at the time you bought the tram?

A. The electric clock and writing or spelling machine.

Cross-Q. 55. Did he have those machines there—the clock and the writing machine?

A. Yes, sir.

Cross-Q. 56. More than one of each?

A. No, sir.

Cross-Q. 57. What did he say to you about those machines?

A. Well, his electric clock, he said, by running those wires down into the ground, it would run for all time to come, or as long as the machinery would last; the writing machine, he said, in place of those marks on the paper, that all you had to do was just touch the machine, and spell the words, in place of strokes or marks on the paper; he spelled John and several other words; it had a dial like a clock.

Cross-Q. 58. Can you describe the clock?

A. The face—it was only a rude structure—the face and the workings of it—and there was a pendulum, the same as another clock, with wires from the bottom of the pendulum running down into the ground, at least he said they were into the ground.

Cross-Q. 59. Was the clock running when you saw it?

A. Yes, sir.

Cross-Q. 60. Did he explain to you what would make it run forever?

A. Electricity from the ground.

Cross-Q. 61. Did he tell you how long he had had it running?

A. I don't remember whether there was anything mentioned about the time.

Cross-Q. 62. Did you ever see that clock or any others running by electricty after that?

A. Mr. Shapely, in Mechanicsburg, built one and it was running there, or that one I saw.

Cross-Q. 63. When was that?

A. I seen that one 1877.

Cross-Q. 64. In your direct examination you were asked how did it—

the talking machine—sound as compared with his voice when speaking in your presence, and you answered, "the same, only not so harsh, I thought." Do you mean to be understood that it was as loud as his voice when speaking in your presence?

A. I meant I didn't suppose he spoke as loud, and it didn't seem as loud or as harsh; he may have spoke in a lower tone.

Cross-Q. 65. Can you state about how loud it seemed to you, I mean the sound you heard?

A. As though he was speaking in an undertone.

Cross-Q. 66. How far off do you think you could hear a man speaking as loud as the instrument did?

A. That would be hard for me to say; my ear was close to the machine, and he was only showing me that the machine would do the work.

Cross-Q. 67. Do you remember what was said when you were listening to the machine?

A. I don't remember the words.

Cross-Q. 68. Do you remember how long you listened?

A. There was only a few words passed through the machine.

Cross-Q. 69. In your direct examination you were asked whether you could have heard what was said excepting through the machine, and you answered, "No, sir; not in the tone that he spoke." How did you know in what tone he spoke?

A. The reason I gave that answer, I heard no other sound excepting the sound that I heard through the machine.

Cross-Q. 70. When he told you that he could run it out for miles, and parties could talk in at the one end and be heard at the other end the same as persons in the same room together, and when he said that it would eventually take the place of telegraphs, what did you say to him in reply?

A. That would be a hard matter for me to give the exact words that I came over at that time, but I had my doubts about it at the same time that he was telling me.

Cross-Q. 71. If you recollect the substance of what you said to him in answer to either of these statements, won't you give it?

A. I don't for this reason, he was explaining and I was the listener; that machine was too rude a machine to think that there was much in it, or ask many questions.

Cross-Q. 72. Do you remember anything you said to him about the machines at that time; if so, will you tell us what it was?

A. No, sir; I don't remember anything I should have said.

Cross-Q. 73. Did you, after you left there, talk about the machines to other persons?

A. Yes, sir; I have talked about all the machines, the clock, his talking machine, his writing machine, and his gas governor.

Cross-Q. 74. To whom did you talk at any time about these talking machines?

A. I have talked to George Free about it, and to others; I have talked to a man by the name of Springer. That is all I can think of just now there is others, if I could just recall their names.

Cross-Q. 75. When and where did you talk to George Free?

A. I can't remember the exact time and place; it was several years ago.

Cross-Q. 76. Was it soon after you saw the machines?

A. No, sir; it was not just shortly—not the same year—not just afterwards; it was some time afterwards.

Cross-Q. 77. What did you say to him about them?

A. We were talking about his negligence in not finishing up these patent-rights and making something out of them.

Cross-Q. 78. If you can recall what you said yourself to him, will you please do so?

[*Objected to by Mr. Hill, as not competent for any purpose except to test the witness' recollection. And the statements that may be made in answer to the question, are objected to as not being evidence for any other purpose. The same objection is made to the preceding question and answer also.*]

A. No, sir; I can't.

Cross-Q. 79. When did you talk with Mr. Springer about these talking machines and what did you say to him?

[*Same objection by Mr. Hill.*]

A. In talking to Mr. Springer, it was only of a recent date—about eight months ago—we merely talked about the machine as a person would in a common-place way.

Cross-Q. 80. If you remember what you said to him, will you please state what it was?

[*Same objection by Mr. Hill.*]

A. I can't remember the words as we spoke them together.

Cross-Q. 81. Will you give the substance of what you said to him?

A. The substance of the conversation was, principally about his inventive genius, and about the things under contemplation of completion.

HONE COMPANY,-1

[*Same objection by Mr. Hill.*]

Cross Q. 82. My inquiry is as to what you said to him about these talking machines. Will you please give me the substance of what you said to him about these machines?

[*Same objection by Mr. Hill, and further objection, on the ground that it is out of the line of the direct examination of the witness, and is not proper cross-examination.*]

A. I don't remember.

Cross-Q. 83. What is Mr. Springer's full name; where does he live and what is his business?

[*Same objections.*]

A. Henry Springer,—lives near Andersontown, and is a shoemaker by trade.

Cross-Q. 84. How came you to have a conversation with Mr. Springer, about eight months ago, about these machines?

[*Same objections.*]

A. He was coming along the road there and we met and got to talking about it.

Cross-Q. 85. Had you had, before that time, any talk with any other persons upon these machines? I mean within a few weeks or months before?

[*Same objections.*]

A. Yes, sir; I had.

Cross-Q 86. With whom?

[*Same objections.*]

A. With Mr. Jacobs.

Cross-Q. 87. Mr. Jacobs, the counsel in this case?

A. Yes, sir.

Cross-Q. 88. When and where did that conversation with Mr. Jacobs take place?

A. In front of my house, in Siddonsburg, if my memory serves me right.

Cross-Q. 89. Which one of you commenced the conversation in relation to these machines?

A. Mr. Jacobs.

Cross-Q. 90. Was there anybody else present?

A. Mr. Drawbaugh was present.

Cross-Q. 91. Did they have these machines with them?

A. Yes sir.

Cross-Q. 92. When was it that they came to see you?

A. Shortly before I had the conversation with Mr. Springer.

Cross-Q. 93. Now will you state what each of them said to you and what you said in reply?

A. They asked me whether I knew anything of Drawbaugh's telephone; I told them I didn't, but that he had a talking machine—that he called it a talking machine; and they produced these articles in company with others, and I pointed these out as the original machines.

Cross-Q. 94. If you told them about the time when you first saw the machines, will you state what it was?

A. The same I have testified to.

Cross-Q. 95. Did you tell them that when you first saw the machine you had your doubts about it, and that the machine was too rude a machine to think there was much in it?

A. No, sir.

Cross-Q. 96. Why didn't you tell them that?

A. The question was not asked.

Cross-Q. 97. Did you remember it at that time?

A. Remember what?

Cross-Q. 98 That you at the time you first saw the machine, had your doubts about it, and that the machine was too rude a machine to think there was much in it?

A. Yes, I remembered it.

Cross-Q. 99. Did they ask you to see other people, and talk about the machines to them?

A. They did not.

Cross-Q. 100. Did you at any time after that, make an affidavit or deposition in relation to these machines?

A. Yes sir.

Cross-Q. 101. When did you do that?

A. I can't tell now the exact time; the evidence is here, though.

Cross-Q. 102. State as nearly as you can?

A. It was last fall; the exact time I can't tell, because I made no memorandum of it.

Adjourned for dinner.

Three o'clock, P. M.

Examination of Mr. Zacharias resumed.

Cross-Q. 103. Who was present when that deposition was taken?

A. Mr. Jacobs, Mr. Drawbaugh and 'Squire Eichelberegr.

Cross-Q. 104. Do you remember who wrote the deposition?

A. 'Squire Eichelberger.

Cross-Q. 105. Did Mr. Jacobs or Mr. Drawbaugh ask you questions, which were taken down, or did you tell your story yourself for the magistrate to take down?

A. Mr. Jacobs told me to go ahead and state to the 'Squire what I knew about the machine, and I did so as well as my memory served me.

Cross-Q. 106. Did you understand or know what the object was in taking that deposition, or what use was to be made of it?

A. I knew, of course, that it was to be in testimony, in favor of that machine.

Cross-Q. 107. Did you put into the deposition the fact, that the first time that you saw the machine you had your doubts about it, and that the machine was too rude a machine to think there was much in it?

A. I wasn't asked that question, and the question was merely asked whether I recognized that machine—at what time and place.

Cross-Q. 108. I understood you to say that you were told by Mr. Jacobs to tell what you know about the machines? If that was so, why didn't you state these facts?

[*Objected to by Mr. Hill, on the ground that the question assumes that they were facts, whereas the witness only testified that they were his inferences and opinions at the time, which inferences and opinions were legal evidence neither when the affidavit was taken nor now.*]

A. He asked me, that is true; Mr. Jacobs asked me for what I knew, but not for my opinion.

Cross-Q. 109. You mentioned a gas governor as one of Mr. Drawbaugh's inventions; what sort of a machine was that and where did you see it?

A. There were two concave dishes, with the concave sides facing one another fastened together with India rubber or gutta percha. I saw it in the shop.

Cross-Q. 110. At the time you saw the machines "B" and "F"?

A. Yes, sir.

Cross-Q. 111. Do you know whether that was a patented invention or whether he manufactured and sold the machines?

A. From his conversation, it was neither patented or was he manufacturing any for sale. I understood that he was only working at its completion; might have made a few test machines.

Cross-Q. 112. When did you first learn that the speaking telephone was in practical use here in Harrisburg, or in any other place?

A. I have only heard talk of it within the last year, I believe, worth mentioning.

Cross-Q. 113. Did you, before that time, read accounts of it in the papers?

A. I may have seen accounts; don't remember them.

Cross-Q. 114. What papers have you been in the habit of reading for the last three or four years?

A. The Mechanicsburg *Journal.*

Cross-Q. 115. Is that the only paper you read?

A. That is the only paper that I have been a regular subscriber for until this year. No, sir; that is not the only paper I read. Since the first of January I have been a subscriber to the New York *World.*

Cross-Q. 116. Have you, for the last three or four years, been accustomed to read any other papers, either regularly or occasionally, as they came in your way?

A. Yes.

Re-direct examination by Mr. Hill:

Q. Q. 117. In your cross-examination, while Mr. Smith was examining you as to what took place in Mr. Drawbaugh's shop, at the time when you listened in the office with your ear to the tin tube, and Mr. Drawbaugh talked into the glass instrument on the floor above, you were asked whether you remembered how long you listened, and you replied in cross-answer 68, in these words: "There was only a few words passed through the machine." What did you mean by that answer? Please explain it more fully.

A. There was only a few words spoken, merely to show that the machine would convey the sound from one place to the other.

Q. Q. 118. Did you believe at the time that you heard and understood all the words that Mr. Drawbaugh spoke into the machine for you to hear?

A. Yes, sir; because he only wanted to show me the working of the machine and there was no cause for deception.

Q. Q. 119. In cross-question 50 you were asked what other things Mr. Drawbaugh manufactured, sold, or had for sale at the time when you bought the tram; to which you replied that he had what was known as Drawbaugh's patent faucet, and that you think it then belonged to Hauck & Co. Do you know when Hauck & Co. bought out the faucet business from the Drawbaugh Manufacturing Company?

A. I do not. The Drawbaugh Manufacturing Company was carrying on in '68, and shortly afterwards it was sold out, but the year I can't tell.

Q. Q. 120. If it should be shown to your satisfaction that Hauck & Co. bought out the Drawbaugh Manufacturing Company in the spring of 1873, what would then be your belief as to whether Hauck & Co. were or were not in control of the faucet business at the time when you purchased the tram and saw the talking machines.

A. I did not know at the time whether those faucets belonged to Hauck & Co. or not, but those faucets were laying there and belonged to some one, or were laying in the shop there, and I had no positive recollection of the time when the firms were changed.

Q. Q. 121. Do you remember what price you paid for the tram that you bought?

A. Fifteen or twenty dollars. He gave it to me under price.

Q. Q. 122. Do you remember why he gave it to you under price?

A. His remark was, he had several laying there, and no call for them, and he would finish me one off for that money.

Q. Q. 123. I wish you would refresh your recollection as to making the affidavit for Mr. Jacobs before 'Squire Eichelberger, and then state whether you are sure as to which one of those gentlemen it was that wrote down your affidavit—whether it was 'Squire Eichelberger himself or Mr. Jacobs.

A. I am under the impression that it was 'Squire Eichelberger. He read the affirmation. I saw the paper, but I didn't give attention to who done the writing.

Q. Q. 124. Who read the affidavit over to you after it was written down?

A. Mr. Jacobs called on Mr. Eichelberger, and Mr. Eichelberger declined on account of sight or of inability; Mr. Jacobs read it.

Q. Q. 125. From the circumstance that Mr. Eichelberger declined on account of sight or of inability, it would seem probable that Eichelberger did not write it. How do you reconcile the fact with your belief that he wrote it?

A. From the fact that he was present and there to take my deposition.

Examination taken, reduced to writing, affirmed, and subscribed before me, this 21st day of April, A. D. 1881.
FRED. M. OTT,
Examiner.

JNO. J. ZACHARIAS.

JOSEPH B. STRETCH, *being produced, sworn, and examined, saith, in answer to interrogatories, as follows:*

Q. 1. State your age, residence, and occupation.

A. Age, forty; residence, Mechanicsburg; occupation, mill-wright.

Q. 2. Were you at any time, as mill-wright, in the employment of Zacharias & Co., at the New Cumberland mills, or Ross' mills, at New Cumberland, in Cumberland county, Pennsylvania; if so, from what time to what time?

A. I wasn't in the employ of Zacharias & Co. I was employed by Henry G. Mosser, agent for Ross' estate at that place. The first work I done for Mr. Mosser was from November 21 to December 19, 1868.

Q. 3. The last?

A. The next was from June 18 to July 3, 1869.

Q. 4. What were you employed to do on these two occasions?

A. On the first occasion, I was employed to put new timbers under the herst; on the second occasion, I was employed to put in two new pair of burrs or mill-stones.

Q. 5. Did Mr. John J. Zacharias, who has just testified in this case, have anything to do in connection with putting in those new mill-stones; if so, what?

A. Mr. John Zacharias, being miller, faced off the burrs and dresssed them up ready for use.

Q. 6. Have you any recollection of his procuring a tram to assist him in facing off and dressing up the burrs on that occasion?

A. Yes, sir; he bought one of Mr. Drawbaugh's patent tram-staffs.

Q. 7. State whether or not such circumstance, of new burrs being put in that mill, and Mr. Zacharias buying one of Drawbaugh's patent tram-staffs to aid in dressing them up, ever occurred on any other occasion than at the time of which you are testifying, so far as you know?

A. No, sir.

Q. 8. How do you fix the date of that transaction?

A. Why, I always keep an account of the work I do, for myself and hands, and I have the dates here from the time the work was done.

Q. 9. Was the tram-staff bought within those dates, from June 18 to July 3, 1869?

A. Yes, sir.

Q. 10. Have you the account book here by which you fix those dates?

A. I have.

Q. 11. Will you please hand it to me, open at the place?

A. Yes, sir; here it is. [Witness hands book to Mr. Hill.]

Q. 12. In whose handwriting are these entries?

A. My own.

Q. 13. When were these entries made in this book?

A. They were made at the end of each week, when we quit work; when this work was going on, which is entered in the book.

Q. 14. Is this your book of original entries?

A. Yes, sir.

Q. 15. Has this book been in your possession from that time to the present?

A. Yes, sir.

[*The book having been submitted to the inspection of counsel for complainants, Mr. Hill requests the examiner to enter upon the record at this point an exact copy of all the entries on the page which the witness points out as the page to which he refers.*]

The examiner copies said page, which is as follows:

April 6*th*, 1869,
To work done at Mrs. Ross' Mill:
J. B. Stretch, 1½ days;
A. H. Smith, 1½ do.
May 14, Smith 5 do.
J. B. S. 4¼ do.
Paid, $30.62½

June 18*th*,
To putting in two new pair burrs:
J. B. S., 5½ days;
A. H. Smith, 5½ do.
26, J. B. S., 4½ do.
" A. H. S., 4½ do.
July 3, J. B. S., 5¾ do.
" " A. H. S., 6 do.
31¾ days @ $2.50, $79.37½.
Paid.

Cross-examined by Mr. Smith:

Cross-Q. 16. Did you mean to be understood in your answer to interrogatory seven that no new burrs had been put into that mill since the ones of which you spoke?

A. No new burrs were put into it after that date while Zacharias was running it.

Examination taken, reduced to writing, and sworn to and subscribed by the witness before me, this 21st day of April, 1881.
FRED. M. OTT,
Examiner.

J. B. STRETCH.

SAMUEL C. CRAWFORD, *being produced, affirmed, and examined, saith, in answer to interrogatories, as follows:*

Q. 1. State your age, residence, and occupation.

A. My age is forty-two; residence, Camp Hill, Cumberland county, Pennsylvania, and occupation, a house painter.

Q. 2. Do you know Daniel Drawbaugh, of Eberley's Mills, Cumberland county, Pennsylvania, and if so, how long have you known him?

A. Yes, sir; I know him; I have known him since the fall of 1874.

Q. 3. Where did you see him, and with whom, in the fall of 1874?

A. At his shop, or work-shop, in company with Mr. Wilson Bear.

Q. 4. Did you go to his shop with Mr. Wilson Bear?

A. Yes, sir.

Q. 5. While you and Mr. Bear were at his shop on that occasion, did you see what Mr. Drawbaugh called his talking machine?

A. Yes, sir.

Q. 6. Please examine the instrument marked "A," which I now hand you, and state whether you ever saw it before, and if so, when and where you first saw it?

PHONE COMPANY,-1

A. This is the instrument, to the best of my knowledge, that I saw at Mr. Drawbaugh's at the time referred to, or one like it. The manner in which I remember the time, or circumstance, I should have said, was we were there regarding the axle business, in which business Mr. Wilson Bear and Mr. Kline were engaged in selling at that time, and Mr. Drawbaugh was showing Mr. Bear through his work-shop. I noticed several instruments that had the appearance to me as being telegraph instruments, and I asked Mr. Drawbaugh whether they were such. The first one alluded to was a fire alarm, then noticing this one, I asked him the question whether this was a telegraph sounding instrument; I can't get at the word, but it was something about a telegraph sounding instrument. Mr. Drawbaugh said, "No, sir; it is a talking machine."

Q. 7. Now, about what time of year was that visit?

A. I couldn't fix the date, but it was some time in the fall of 1874.

Q. 8. Was it cold weather; had there been any snow?

A. No, sir.

Q. 9. Was the weather such as to require fires—was there any fire in the shop that day?

A. No, sir.

Q. 10. Were you about entering Mr. Wilson Bear's employment at that time?

A. As near as I can remember, I was.

Q. 11. Had you been out of employment for some time previous to that?

A. Yes, sir.

Q. 12. What had been the cause of your being so out of employment?

A. The amputation of my limb.

Q. 13. Do you remember the fact of Wilson Bear and Mr. Kline associating themselves with M. M. Grove and J. A. Moore under the name of M. M. Grove & Co., commonly called The Axle Company, for the manufacture of axles and sewing machine axles or journals at Mr. Drawbaugh's shop?

A. Yes, sir.

Q. 14. At what time was your leg amputated?

A. The tenth of June, 1874.

Q. 15. State whether your said visit to Mr. Daniel Drawbaugh's shop was or was not between the date when your leg was amputated and the date when the firm of M. M. Grove & Co. was established and commenced business at that shop?

A. It was.

Q. 16. After your visit to said shop with Mr. Bear, as you have testified, were you in Mr. Bear's employment for some time?

A. Yes, sir.

Q. 17. Were you in the employment of M. M. Grove & Co. after they started?

A. I was for a few days, to go to Allentown to see after their axles which they were having manufactured at that place.

Adjourned until 9 A. M. to-morrow.

April 22, 10 A. M.

Examination of Mr. Crawford resumed pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow, for complainants, and Mr. Hill, Mr. Abraham and Mr. Jacobs, for respondents.

Cross-Q. 18. Did you ever see any other talking machine instrument at Daniel Drawbaugh's except "A?"

A. No, sir.

Cross-Q. 19. You have stated in your sixth answer that on the occasion when you saw it, Mr. Daniel Drawbaugh said, "No, sir, it is a talking machine;" please to tell me anything else that was said about talking machines on that occasion?

A. Do you wish me to state whether there was anything said outside of what I have testified? There might have, but I couldn't recollect more than I have said already.

Cross-Q. 20. After he told you that it was a talking machine, I suppose you made some remark about it, or some inquiry, didn't you?

A. Probably I did; I don't remember more than I have testified.

Cross-Q. 21. Did you stay around there after you heard that, or did you go right away?

A. In all probability we left right away, for we had been there on business—Wilson Bear had been there on business; we had attended—I know that—before that we had attended to the business that called us to go there, and know of no other business that was transacted after that on that occasion.

Cross-Q. 22. I suppose then that, after you got through your business, you looked around among some of his contrivances, out of curiosity, did you?

A. Yes, sir.

PHONE COMPANY,-1

Cross-Q. 23. When did you next go to his shop?

A. That I couldn't say; we went there very frequently that fall, but saw nothing more.

Cross-Q. 24. I suppose you have been there since that fall, often, have you not?

A. Yes, sir.

Cross-Q. 25. Please describe to me any other talking machines you ever saw there, since that fall?

A. I saw none others than this one [pointing to instrument "A."]

Cross-Q. 26. When did you see the instrument "A" after that fall?

A. In 1880.

Cross-Q. 27. What time in 1880, and where?

A. The exact month I couldn't name, probably the last of June or the first of July, in Shiremanstown.

Cross-Q. 28. And where in Shiremanstown?

A. On the street.

Cross-Q. 29. Who showed it to you, and who was present?

A. If you will allow me here to go into details, I was painting at Mrs. Smith's house, when Mr. Drawbaugh and Mr. Jacobs and Mr. H. N. Bowman stopped in front of the house, for what purpose I could not state. I went out to the carriage and spoke to Mr. Drawbaugh, and I saw this instrument—talking machine—and remarked: "I think you are in business, judging from the appearance of things." He says, "yes, sir." I do not remember now whether he said he was on the hunt of Mr. Zimmerman. Mr. Jacobs said, "Had you ever saw any of those instruments?" I told him that I had saw this to the best of my recollection. Mr. Jacobs then asked me when I would be at home; I told him I could not say. He asked me whether I would make affidavit as having seen this machine; I told him I would do so; he said they would call and see me.

Cross-Q. 30. Did you afterwards make an affidavit for Mr. Jacobs, about this machine, and, if so, when and where?

A. Yes, sir, I did; I could not tell the date—probably three weeks after that, at Camp Hill.

Cross-Q. 31. Before whom did you swear to it?

A. H. N. Bowman.

Cross-Q. 32. At this office?

A. No, sir.

Cross-Q. 33. At whose house or office was it?

A. At my house.

Cross-Q. 34. Have you, since then, made a second affidavit?

A. No, sir.

Cross-Q. 35. When Mr. Drawbaugh and the others came to you, in Shiremanstown, how many other instruments besides "A" did they show you?

A. They did not show me any others; there was others with them in the carriage, which I recognized since I am here, that they are used, or have been used, as talking machines.

Cross-Q. 36. Did you ever see the inside of "A?"

A. No, sir.

Examination taken, reduced to writing, and affirmed before me, this 22d day of April, 1881, and subscribed to.
FRED. M. OTT,
Examiner.

S. C. CRAWFORD.

DANIEL WESLEY SMITH, *being produced, affirmed, and examined, saith, in answer to interrogatories, as follows:*

Q. 1. State your age, residence and occupation.

A. I am thirty-two years by the fifth of next August; have worked at printing, on a small scale, with a small office of my own, and between times I have followed peddling; I have not had enough of that kind of work to do—printing blanks, bill-heads, and such things—and living in a part of the country where such things were not in much demand, I have had occasion to follow other things besides printing. My present residence is in Lisburn, Cumberland county, Pennsylvania.

Q. 2. State whether you are acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.?

A. Yes, sir; I got to be intimately acquainted with him while we lived there, but I knew him before, but not intimately.

Q. 3. Where did you reside in the fall of 1874?

A. At Lewisberry, York county, Pa.

Q. 4. State what changes of residence you made that fall and the next spring?

A. We moved from Lewisberry to Milltown, Cumberland county.

Q. 5. What other changes?

EPHONE COMPANY,-1

A. We lived there about two months and then moved to Harrisburg, to a place on Ridge road; I don't remember the number.

Q. 6. What time of year was it when you moved from Lewisberry to Milltown or Eberly's Mills?

A. In the fall, right after corn-husking; I don't remember any date.

Q. 7. Milltown and Eberly's Mills are names for the same place, are they not?

A. Yes, sir.

Q. 8. While you were residing at Milltown, were you at any time in the shop of Mr. Drawbaugh at that place?

A. Yes, sir; very frequently.

Q. 9. Did you, while there on any of those visits at that time, see Mr. Drawbaugh working on a machine or instrument for talking at a distance?

A. Yes, sir; he was working on the parts of an instrument he called a talking machine.

Q. 10. Will you please examine the instrument marked "A," which I now hand you, and state whether you have any knowledge of having seen it or any of its parts—if so, when and where you first saw it or them?

A. The parts he was working at were something like this—its mouth-piece and those screws—and I did not see it together in this shape; it was to be something of this shape, I recollect; I didn't charge my memory.

Q. 11. How soon after you moved to Milltown or Eberly's Mills was it that you saw him working at this talking machine, as you have testified?

A. Within one week Dan came to my place and told me to come down to his shop and see him working at the shop.

Q. 12. Did you go?

A. I had my work there to attend to, and I don't think I went down—probably in a day or two—I couldn't fix no date.

Q. 13. Well, fix the time as near as you can.

A. As I don't know the date when I moved, it would be impossible for me to locate the particular time when I was down to see Dan.

Q. 14. You lived there about two months; was it during the early or latter part of your residence there that you first saw Drawbaugh working at the talking machine?

A. Well, I was down there frequently all the time I lived there. It was during the early part that I first saw the machine.

Q. 15. Did you at that time have any conversation with Mr. Drawbaugh about the talking machine at which he was working?

A. Yes, sir.

Q. 16. State that conversation, as nearly as you can recall it.

A. He told me he was working at an instrument to convey the voice, to supply the place of the telegraph, and I asked him the limits, thinking it was merely something to connect rooms from one to another, but he gave me as an illustration the distance between Harrisburg and Philadelphia—that parties at that distance could communicate as if they were speaking together. I asked him the limits, and he said, if it were perfected, there would be hardly any limits; that is all; we spoke frequently; he passed my house every morning as he went to his shop.

Q. 17. By limits do you mean limits within which persons could speak to each other by means of this instrument—limits of distance?

A. Yes, sir; I understood him to mean, by saying no limits, great distances.

Q. 18. Did he at that time tell you how or on what principle the machine operated?

A. I don't distinctly remember, but was under the impression and am pretty sure that he intimated electricity; I was under that impression all the time. Well, from his having numerous batteries and a heap of what he called insulated wire—by that I was under no other impression than it was by electricity.

Q. 19. Did he say anything at that time about procuring a patent on it?

A. Yes, sir.

Q. 20. What did he say, as nearly as you can remember?

A. As near as I can remember, he said he had not got the the means required to take out a patent.

Q. 21. Did he or not express his intention to take out a patent when he got the means?

A. He said, if he got able, he was going to have it patented. That is what he told me.

Cross-examined by Mr. Storrow:

Cross-Q. 22. After you moved over to Harrisburg, did you ever go to Drawbaugh's shop?

EPHONE COMPANY,-1

A. No, sir; not till we moved back, and that was last summer, that I was there but a few minutes—passed there.

Cross-Q. 23. And so you have never been in his shop between the spring of '75, when you moved to Harrisburg, and the summer of '80—is that what you mean?

A. Yes, sir.

Cross-Q. 24. You are quite sure that you were never in his shop during those five years, are you?

A. Yes, sir; I am positive that I was not in his shop till last summer, in that time.

Cross-Q. 25. How often did he come to where you lived or worked during those five years?

A. Not once that I can remember. We lived eight or nine miles away from his shop at that time.

Cross-Q. 26. Where have you been in the habit of meeting him since the spring of 1875?

A. I met him frequently in town—when I came to town here.

Cross-Q. 27. Do you mean in Harrisburg?

A. Yes, sir.

Cross-Q. 28. Where did you meet him in Harrisburg?

A. I can't locate any spot. I have passed him on the street. I remember distinctly once of meeting him at White Hall hotel, in Harrisburg.

Cross-Q. 29. When was that?

A. I could not remember, as I have no date to go by and didn't charge my memory as to meeting a friend.

Cross-Q. 30. How many times have you seen him since the spring of '75?

A. It would be impossible for me to tell—frequently, though.

Cross-Q. 31. Give me some idea of what you mean by frequently—once a week, or two or three times a year?

A. I mean probably three or four times in a year.

Cross-Q. 32. At these meetings did he and you talk about his talking machine?

A. No, sir; we merely met as friends would meet, salute each other, and talk of some news of the day; something of that amount. There was never anything intimated about the talking machine in any of our meetings.

Cross-Q. 33. When did you next see any of the parts of instrument "A," after the very first time you saw it?

A. I don't remember of seeing that instrument, only 'till last fall, when Dan was by my place, and had an instrument with him, something like this one, but I don't know whether this is the same one.

Cross-Q. 34. Who was with him when he came to your place last fall with that instrument?

A. This gentleman, Mr. Jacobs, was with him; only those two, Mr. Jacobs and Mr. Drawbaugh.

Cross-Q. 35. Did they have any other instruments with them?

A. They had a battery and several other parts; to see whether I would know them.

Cross-Q. 36. Did you make an affidavit for them on that occasion, or soon after?

A. On that occasion.

Cross-Q. 37. Please tell me as near as you can, when it was?

A. We were husking corn; I can't just tell what date; I could tell if I had my book here; I could tell the date precisely, but I haven't that with me.

Cross-Q. 38. Where is your book?

A. It was only a small pass-book and is at my place of residence, at Lisburn. From a paper just shown me by Mr. Hill, I am satisfied that it was the twenty-first day of October, 1880.

Cross-Q. 39. When you saw Mr. Drawbaugh at work on the parts of an instrument, as you have described, while you lived at Eberly's Mills, I suppose you remember what he told you what each part was for, and how he intended to put them together; don't you?

A. No, sir; he didn't describe the particular uses of the several parts.

Cross-Q. 40. Did he show you how they were to be put together?

A. No, sir; I only saw it in parts all the time he was working at it.

Cross-Q. 41. Did he tell you how it was to be used, when put together?

A. I remember of him saying that a piece like this [indicating mouth-piece of instrument "A"] was to be used as a mouth-piece. Something like this, I am not positive whether this was the piece.

Cross-Q. 42. What was he doing to the parts, when you saw him working at them on this occasion?

A. He was turning screws and thumb-heads like this here, [pointing to the milled thumb-screws-heads on the two sides of the instrument marked "A"] on a lathe on the second floor.

Re-direct examination by Mr. Hill.

Q. Q. 43. Do you remember whether it was before or after corn-husking in the fall of 1874, that you saw him turning up those screw-heads?

A. Yes, sir; it was after. We moved right after corn-husking, and it was after we moved, that I saw him, working at work of that kind on the instrument.

Q. Q. 44. Did you move back to Harrisburg before, or after the first day of January, 1875?

A. I can't remember whether it was before the holidays or after; I am not able to say. I rather think it was after.

Q. Q. 45. When you made the affidavit for Mr. Jacobs and Mr. Drawbaugh in the fall of 1880, who administered the oath or affirmation to you?

A. Mr. Jacobs.

Q. Q. 46. I mean who was the justice of the peace who swore you or affirmed you?

A. I was affirmed by Mr. Jacobs to what I had said, then and there.

Q. Q. 47. Do you remember whether or not an elderly gentleman, 'Squire John F. Lee, of New Cumberland, Pa., was with Mr. Jacobs and Mr. Drawbaugh at the time?

A. No, sir; I don't remember more than of Mr. Jacobs, and Mr. Drawbaugh. If there was another gentleman, he was in the conveyance and I didn't notice him.

Q. Q. 48. Where were the parties when the affidavit was made?

A. At the house of Mr. Bentzel, where I was husking corn.

Q. Q. 49. Do you remember whether the affidavit was written in the house or in the carriage?

A. In the carriage.

Q. Q. 50. Were you in the carriage, or standing by it?

A. Standing by it.

Adjourned until two o'clock P. M. for dinner.

AMERICAN BELL TELEPHO

Two O'clock, P. M.

Examination of Mr. Smith resumed, pursuant to adjournment.

Present Mr. Smith and Mr. Storrow, for complainants, and Mr. Hill, Mr. Abraham and Mr. Jacobs, for respondents.

Re-Cross-Q. 51. When Mr. Drawbaugh and Mr. Jacobs came and got your affidavit, what instruments, or parts of instruments, did they have beside "A"?

A. A battery of some kind, as I stated before, and a few other pieces that I can't accurately describe.

Re-Cross-Q. 52. Please to describe them as well as you can?

A. There was a large jar that I understood represented the battery and a few other wood pieces. The one like "A."

Re-Cross-Q. 53. Did you see anything, except wood pieces, on that occasion other than what you have described?

A. Not wood pieces; but several coils of wire—small coils of wire—to see whether I would recognize the materials he was working on. I could only recognize them as such coils of wire as I saw him have in the shop, when he was at work.

Re-Cross-Q. 54. Since your last answer was given, a number of instruments have been placed upon the table by respondents' counsel. State whether any of those are the instruments, and if so, point out which ones they are?

A. This here jar "F" is one I recognize. And this one "B" with the wire. I ain't so positive about the other two, but it is very likely he had them along. [The other two are marked "D" and "E" for identification.]

Re-Cross-Q. 55. When you saw Drawbaugh at work on the parts of "A" in 1874, as you have testified, what other work was going on in the shop?

A. There was not any work that I was familiar with; there had been a faucet company, but I don't know whether they were doing anything at that time. If there was anything, it was not very extensive, or I would have known something of it. I remember one time of Mr. Wilson Bear, of Camp Hill, and some other gentleman, whose name I don't know, being there to see Dan on business of some patent axle, but the nature of their business, farther, I know nothing about.

Re-Cross-Q. 56. Was this while you lived at Eberly's Mills, that these gentlemen came there to see him about a patent axle?

A. Yes, sir.

EPHONE COMPANY,-1

Re-Cross-Q. 57. Were Mr. Grove, or Mr. Moore, or both of them, the gentlemen who came with them?

A. I don't remember any other parties, but the two gentlemen who I saw there.

Re-Cross-Q. 58. Was Mr. Jacob Kline the other gentleman?

A. I could not say at all; for I did not know the other gentleman, I was acquainted with Mr. Bear, but not the other. I did not know who he was.

Re-Cross-Q. 59. The first time you saw Mr. Bear and the gentleman there about their axle, was it before or after you saw Drawbaugh at work on the parts of "A," as you have testified?

A. It was while he was working at them, and it was the only time that I saw them there.

Mr. Hill states that, on his way to this room after dinner, the witness met him at the door of this building, and stated that he desired an opportunity to correct his testimony on one point, and for that purpose Mr. Hill will ask one or two questions more.

Re-re-direct by Mr. Hill:

Q. Q. Q. 60. Since testifying here this forenoon, have you refreshed your recollection as to the persons in the carriage, at the time when you made your affidavit last fall?

A. Yes, sir, I distinctly remember that there was an elderly gentleman with the party, consisting of three, that I had forgotten. I was thinking over this, while at dinner, and remembered very distinctly that there was such a gentleman, but I didn't know who the gentleman was.

Q. Q. Q. 61. Did anybody talk to you about the matter after you left the witness stand, until you told me at the door, that you wished to correct your testimony?

A. No, sir, I went to the hotel and registered my name on the register, and was thinking over all that I said here, when it flashed on my mind that there were three gentlemen, in place of two, when I gave my affidavit.

Examination taken, reduced to writing, and affirmed and subscribed before me, this 22d day April, 1881.

FRED. M. OTT,
Examiner.

D. W. SMITH.

CHARLES W. DIVEN, *being produced, sworn, and examined, saith, in answer to interrogatories, as follows:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is forty-nine; residence, Fifteenth street, near Herr street, Harrisburg; am Superintendent of the State Arsenal.

Q. 2. Are you able to inform me when and for what length of time one Michael P. Smyser was employed at the State Arsenal, of which you are superintendent?

A. The records of the Arsenal show him to have been on duty from June 1, '70, until June 30, 1873.

Q. 3. State whether you have obtained these dates from an examination of the Arsenal records this morning?

A. Yes, sir; I have.

Cross-examined by Mr. Storrow:

Cross-Q. 4. In what capacity was he employed?

A. One of the employés—a laborer. He could do the labor or duties to be done there.

Examination taken, reduced to writing, and sworn and subscribed to before me, this 22d day of April, 1881.
FRED. M. OTT,
Examiner.

CHAS. W. DIVEN.

MICHAEL P. SMYSER, *being produced, affirmed, and examined, saith, in answer to interrogatories, as follows:*

Examination by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, fifty; residence, Lisburn, Cumberland county; and occupation an auctioneer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county?

A. Yes, sir.

Q. 3. How long have you known him?

A. About twenty-five years.

Q. 4. Were you formerly employed at the State Arsenal, at Harrisburg—if so, from what time to what time?

A. Yes, sir; I was, from '70 to '73.

Q. 5. During that time, where did your wife reside?

A. At Lisburn, Cumberland county, where I reside at present.

Q. 6. Where is the State Arsenal at which you were employed?

A. It was then in the Capitol grounds here at Harrisburg.

Q. 7. While you were so employed, did your way to and from your home in Lisburn take you by Eberly's Mills?

A. Yes, sir.

Q. 8. State whether, during that time, when going back and forth between Lisburn and Harrisburg, you occasionally stopped at Daniel Drawbaugh's shop, at Eberly's Mills, to see him?

A. Yes, sir.

Q. 9. Do you recollect anything about stopping to see him once, on one of those occasions, with reference to a magic-lantern?

A. Yes, sir.

Q. 10. When was that?

A. It was 1871 or 1872—it was not later than 1872.

Q. 11. While there, on that occasion, state whether Mr. Drawbaugh did or did not exhibit to you what he called his talking machine?

A. He did, sir.

Q. 12. State whether you identify any of the instruments now present, with the machine which he then and there exhibited to you?

A. Yes, sir; it is laying right in front of me. Both of these instruments [indicating instruments "F" and "B."] ["F" and "B" are the only instruments within sight of the witness.]

Q. 13 At what place or places in the shop were those two instruments at that time?

A. This [indicating "F"] was in the cellar, down on the ground floor; there was no flooring there; the ground formed the floor. This [indicating "B"] instrument was on the upper floor; there were two flights of stairs up to where this instrument was.

Q. 14. Were the two instruments connected in any way?

A. Yes, sir; they were connected by a cord, coil, or whatever you may term it—green cords, two of them.

Q. 15. Do you see anything about the instrument now that resembles those cords?

A. Those [indicating the wrapped wire on the electro-magnet of instrument "B"] do.

Q. 16. Did Mr. Drawbaugh, on that occasion, exhibit to you the operation of the talking machine?

A. He did.

Q. 17. Please explain how he exhibited it; tell us all about the exhibition.

A. We went into the cellar on the ground floor, Mr. Drawbaugh and I; a boy, whom I supposed to be Mr. Drawbaugh's boy—I did not ask him whether it was his boy or not—was there, and Mr. Drawbaugh told the boy that he should sing a piece and we would go up stairs—that is, Mr. Drawbaugh and I, where this box [indicating "B"] was, connected with the other by the green coil or wire, whatever you may term it, and he said I could hear it distinct. I took particular notice when we went up stairs that the doors were shut after us. We went into the room where instrument "B" was—the tin box. The boy sang a piece, "Don't you want to be a Christian while you're young?" I heard it just as distinct as if the boy would have been in the room where I was listening at the box. After the boy had sang the piece, Mr. Drawbaugh told him to whisper. He counted five in a whisper, in this way: "one—two—three—four—five" [whispering.]

Q. 18. When the boy was singing the piece, state whether or not you heard and understood the words which he sang as distinctly as you did the music?

A. I did, sir.

Q. 19. Did Mr. Drawbaugh go out of the room to tell the boy to count?

A. He opened the door and halloed down to the boy to whisper; I took notice that he closed the door. Then the boy counted five in a whisper, as I repeated a while ago.

Q. 20. What door did he open; the stair-way door?

A. The stair-way door where we were.

Q. 21. Did Drawbaugh tell you at the time how the instrument was operated, whether by electricity or otherwise?

A. He did; by electricity—it would carry the sound.

Q. 22. Did he tell you how far it would carry the sound?

A. He did, sir; he said he could make a talking machine that could talk from here to California.

Q. 23. Was that visit, to your best recollection, the year before you quit working at the arsenal?

A. Yes, sir.

Q. 24. What was your reason, at that time, for looking into the magic lantern business?

A. My reason was that I was a poor man—and am yet—and in changing of Governers I would have to look out for something, if I was not retained by the incoming Governor, to make a living.

Q. 25. Your arm had been taken off at the shoulder at the battle of the Wilderness, had it not?

A. Yes, sir.

Q. 26. Since leaving the arsenal, have you occasionally visited Mr. Drawbaugh's shop?

A. I have.

Q. 27. Have you, at different times, seen other talking machines at his shop?

A. Yes, sir.

Q. 28. Please look at the twelve other instruments which I now show you, and state whether you recognize any of them as instruments which you saw at Mr. Drawbaugh's shop on other occasions, subsequent to June, 1873?

A. Here is a machine [indicating "A"] that I saw, or one like it, as near as I can tell, and I saw these other ones, [indicating "D" and "E,"] and I saw every other instrument Mr. Drawbaugh had up to six or eight months ago. I have saw this [indicating a machine which is marked "H" for identification;] I saw the instrument marked "I," also "C;" I saw a box like this [indicating box marked "J" for identification.] I saw other machines, but I couldn't particularly identify these others; ["these others," referred to by the witness, are marked "G," "K," "L," "M," "N," for identification.] When I would visit Drawbaugh's shop after the time when I saw machines "B" and "F," I would ask him how he was getting along with his talking machine; he would tell me that he was making improvements, showing me the different improvements.

Q. 29. To the best of your memory and judgment, how many times a year, from June, 1873, to July, 1880, did you visit Mr. Drawbaugh's shop, and see his machines?

A. I visited it some years maybe a dozen of times, or two dozen of times, I couldn't tell positive how many; some years not so many.

Q. 30. What was your observation as to Mr. Drawbaugh's continuing his work on the talking-machines, and making different forms and improvements on the talking-machines, from the time when you first saw them down to July, 1880. Did he seem to be always thinking about them and working upon them, so far as you had opportunity to know, or not?

A. His conversation he and I had was about the machines, because I would ask him how he was getting along with the talking-machine, and then he showed me the improvements on it.

Q. 31. During all that time, did he or did he not frequently show you talking-machines which you had not seen before?

A. He did.

Q. 32. What did he say about them, when he would show you machines which you had not seen before?

A. He said he was making improvements on them.

Q. 33. Did Mr. Drawbaugh ever say anything to you about procuring a patent on his talking-machines?

A. He did.

Q. 34. What did he say about it?

A. He told me that he would procure a patent, but he was making improvements on it. He was going to procure a patent.

Q. 35. In connection with those remarks about procuring a patent, did he say anything about his pecuniary means, and if so, what?

A. Yes, sir, and I knew it without him telling me. He told me that he was poor.

Q. 36. Did he say anything about his poverty interfering with his work upon the machines?

A. He did.

Q. 37. What did he say about that?

A. That he couldn't work at the machine all the time, because he had to do something else to sustain his family.

Q. 38. Do you know his family?

A. I knew his wife and children, yes, sir.

Q. 39. How large a family had he to support?

A. I can't tell the number of his children exactly—how many he has.

Q. 40. Do you recollect anything about sickness in his family during that time?

A. Now, that I can't answer you positive—to the best of my knowledge, he had sickness in his family. That is, I heard so.

Q. 41. Do you know what Mr. Drawbaugh's general reputation was, in the neighborhood where he lived, and is, for honesty, and truthfulness, and as a citizen of that community?

A. I never heard his word doubted or his character either. He is a poor man.

Cross-examined by Mr. Storrow.

Cross Q. 42. Were you at Mr. Drawbaugh's shop in the first half of 1880; and if you were, what work was then doing on telephones?

A. I was there, and I seen that there was improvements, as I stated before.

Cross-Q. 43. Which instruments did you see him at work on in the first half of 1880?

A. I can't tell you that—I can't give you the right answer.

Cross-Q. 44. What improvements did you see in the first half of 1880?

A. I seen the machines were gotten up in better style.

Cross-Q. 45. Did you see many telephones there in 1880, besides these that have been shown you during your deposition?

A. Well, I couldn't say how many. He would show me the improvements, still, that he had made.

Cross-Q. 46. Did you, during the first half of 1880, at Drawbaugh's shop, see any telephone instruments, other than these that are now on the table?

A. Well, I couldn't say positively whether I did, unless I would see the machines, but I rather think I did.

Cross-Q. 47. Didn't you see quite a number of others during that time?

A. When he would show me an improvement, why he would just show me that, and the other ones he wouldn't show me because I could see that there was an improvement. That is after I saw the other ones, still they were the later improvements. I had seen the other ones before.

Cross-Q. 48. I suppose you mean by that, that when you went there, he showed you the latest, and most improved one and didn't take the trouble to show you the old ones over again; do you?

A. If you mean the old ones that I had seen, yes, sir.

Cross-Q. 49. Did you talk through any of his machines, or hear any-one talk through them, in the first half of 1880?

A. I did not.

Cross-Q. 50. Which of these machines did he show you as his newest and most improved machine, in the first half of 1880?

A. This machine [indicating "J"] I saw in or about that time; I can't be definite.

Cross-Q. 51. I suppose you mean that you first saw it about that time, do you?

A. I can't say that it was the first half of 1880. I recollect seeing a box similar to this; I took notice to the nice curled walnut—the cover of it—the lid of it.

Cross-Q. 52. State as near as you can when you first saw the box "J," or one like it.

A. I couldn't say whether it was in 1880 or 1879; in or thereabouts.

Cross-Q. 53. State what other of the instruments on the table he showed you for the first time in 1879, as his newest and most improved instruments?

A. I can't answer that question—put it down just in 1879—I can't do it.

Cross-Q. 54. Can you tell me which of these instruments on the table he showed you in 1878?

A. No, sir.

Cross-Q. 55. Of these instruments on the table, which was the last one he showed you, as his latest and most improved?

A. The last one I don't think is on the table.

Cross-Q. 56. Of these which are on the table, which did he show you the latest?

A. I can't answer whether it was this [indicating "J"] or this other one, [indicating "H"]—saw them both together at one time.

Cross-Q. 57. When was it that you saw them both together?

A. I can't remember.

Cross-Q. 58. Had you ever seen "H" before that time when you saw "H" and "J" both together?

A. I can't recollect that.

Cross-Q. 58½. When you saw these two together, did he say anything to you about getting a patent on either of them?

A. He did not, but I took it for granted that he was going to get it patented, because he had told me on former visits that he was going to get it patented.

Cross-Q. 59. Did he say anything to you about geting it patented at any time since January, 1878?

A. He did tell me before January, 1878, and he told me since, that he was going to get it patented.

Cross-Q. 60. Has he told you that more than once since January, 1878?

A. I think we have talked about it since, but I won't be positive; I couldn't tell how often we talked, because Mr. Drawbaugh and I were very intimate, and I was always anxious to know how he was getting along.

Cross-Q. 61. Why didn't he get it patented in 1878 or 1879?

A. He didn't tell me why, but I supposed because he hadn't the money to do it—was poor.

Cross-Q. 62. Point out, among the instruments on the table, which are the ones you did not see until after January, 1878.

A. I don't know that I saw this machine in front of me marked "J," and this one [indicating "H"]; I won't be positive.

Adjourned until 9 o'clock, A. M., to-morrow morning.

April 23, 9 *o'clock, A. M.*

Examination resumed.

Present Mr. Storrow and Mr. Smith, for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

Cross-examined by Mr. Storrow:

Cross-Q. 63. I understand you to say that, from the time you first saw a talking machine at Drawbaugh's down to last summer, he was too poor to apply for a patent; am I correct or not?

A. I did not say down to last summer.

Cross-Q. 64. Please explain what you did mean in that respect.

A. I meant that he was too poor; I did not specify any time whatever.

Cross-Q. 65. Was he too poor in 1872?

A. I thought he was too poor, just because I didn't know what it cost to procure a patent; I never had any experience in the patent-right business—that is, procuring patent-rights—what it cost.

Cross-Q. 66. Up to what time did you think he continued too poor to take out a patent?

A. I can't answer that question.

Cross-Q. 67. Then you don't mean to say that he was too poor to take out a patent in 1876?

A. I haven't. I might answer that question this way: I didn't know what it cost to take out a patent; no experience, and I thought he was too poor, maybe. No conversation with Mr. Drawbaugh in regard to a patent in 1876. That is the best of my knowledge.

Cross-Q. 68. Are you prepared to say that in 1876 he was too poor to take out a patent?

A. No, sir; I can't answer that question.

Cross-Q. 69. Are you prepared to say that in 1877 and 1878 he was too poor to take out a patent?

A. No, sir.

Cross-Q. 70. Are you prepared to say that in 1875 he was too poor to take out a patent?

A. No, sir.

Cross-Q. 71. Did you in 1878 then consider that he was too poor to take out a patent?

A. I didn't give it any thought, because I didn't think it belonged to me.

Cross-Q. 72. Would you make the same answer about 1875, 1876, and 1877?

A. I would—just the same as the other answer. I didn't give it no thought at all—that is, with regard to getting out a patent-right.

Cross-Q. 73. If you had been told that he could get out a patent for thirty-five dollars, would you have thought he was to poor in all those years to do it?

A. I didn't give it, as I stated before, the getting out a patent-right, no thought—not at that time.

Cross-Q. 74. When did you begin to give thought to his getting out a patent-right?

A. When Mr. Drawbaugh showed me this box [indicating "B"] connected by two wires with the glass tumbler ["F"], I said "You ought to get a patent on that."

Cross-Q. 75. When did you next give thought to the subject of getting a patent on the talking machine?

A. I can't answer definitely.

Cross-Q. 76. Did you ever give thought to that subject after the first time you mentioned?

A. I thought he would at some time.

Cross-Q. 77. Did he and you, after that, ever talk about his getting a patent?

A. I do not know; we might have. I couldn't tell that.

Cross-Q. 78. I suppose within the last six or eight months you have talked with him about his getting a patent; haven't you?

A. I don't know as I did.

Cross-Q. 79. You took a good deal of interest in the improvements he was making in his talking machine after 1873, didn't you?

A. I did.

Cross-Q. 80. Please tell me what talk you had with him, after 1873, about patenting his improvements?

A. I asked him how he was getting along with his talking machine, and he said he was making improvements on it.

Cross-Q. 81. My question was, what talk you had with him about getting out a patent on those improvements; please answer that.

A. I will answer that question as I did the other, that I don't know that I had no particular conversation with regard to the getting out the patent.

Cross-Q. 82. Do you recollect having had any—if so, state what it was?

A. The only conversation that I can state was when the first operation or message conveyed on that there [indicating "B" and "F";] when the boy sang—then I said to him, "If this works right, and you get it completed, you ought to get a patent-right—you ought to get it patented."

Cross-Q. 83. On that occasion, when the boy sang and whispered through "F" and "B," as you have described, did you hold "B" in your hand, or did it lie on the bench?

A. That ["B"] was on the table or bench.

Cross-Q. 84. How near to it did you put your ear?

A. I might have put it within two or three inches or within an inch; I don't know exactly the distance.

Cross-Q. 85. Don't you think your ear was a foot from it?

A. No, sir.

Cross-Q. 86. Please to give your best recollection as to how far your ear was from it.

A. Just the same; I will repeat the answer before, that it might have been within an inch.

Cross-Q. 87. Is it your recollection, that your ear was not more than four inches from it?

A. My ear was closer than that, because this thing being a new thing, evidently I would put my ear close to it, to hear the sound, or to hear the boy sing.

Cross-Q. 88. I do not ask you what you now think is evident or probable; I want you to tell me your recollection of what you actually did then, if your memory enables you to answer.

A. I can't tell exactly how far my ear was away from the instrument.

Cross-Q. 89. Please give me your best recollection on that point, if you have any recollection.

A. I shall repeat the answer as I did before; that is the only answer that I can give; I can't specify a certain distance; I can't do it truthfully, and shan't do it, unless I can do it truthfully.

Cross-Q. 90. What part of the instrument "B" did you put your ear nearest to?

A. I put my ear to this side, [indicating the end of the tin tube farthest from the electro-magnet.]

Cross-Q. 91. Were "B" and "F," at that time, in the same condition they are now in? If they were not, point out any differences that you remember.

A. No, sir; they are not in the same condition they were then. There was a parchment covering over the end of the tube of "B" next to the electro-magnet. I don't take notice of any other difference in "B," only the wires were connected. I can't tell whether this machine "F" was in the same condition as now, because I didn't take so much notice of that. I took notice when we went into the cellar, and he told the boy to sing, that the machine in the cellar was a broken tumbler, or something like a broken tumbler. That machine there [indicating "F"] is just like that, to the best of my knowledge; I took notice that the tumbler had a covering—a wooden covering, like that now on it. I took notice that the tumbler was painted inside.

Cross-Q. 92. What part of the tumbler did you take notice was broken?

A. I took notice that the bottom was broken off, or cut off.

Cross-Q. 93. Wasn't that end of the tumbler all covered up, so that you couldn't see whether it was broken off, or not?

A. I will answer that question in this way: I says to Mr. Drawbaugh, "What are you doing with a tumbler?" and he says, "It is a broken tumbler," and then I took notice it was broken; I merely glanced at the tumbler; I didn't take notice of its being all covered over.

Cross-Q. 94. What was there inside the tumbler?

A. I didn't take particular notice of the inside; I seen it was painted inside—was white inside as if it was painted, because I could see by looking at the outside of the tumbler, that it was painted, or whitened in some way; I was anxious—my attention was drawn, or anxious to go up stairs to hear the boy sing, to see whether the sound of his voice could be conveyed, on the wire, from the tumbler to the box there.

Cross-Q. 95. Wasn't there a frame to hold it, or a basin for it to stand in?

A. I can't say just exactly what it was on. I can't answer definitely. Mr. Drawbaugh took the tumbler in his hand. I don't remember whether it was lying down or not; my attention, as I said before, was drawn upstairs. The first I took notice of it, Mr. Drawbaugh took it up, and handed it to the boy.

Cross-Q. 96. I call your attention to the instruments now on the table, marked "A," "D," "E," "H," "J," "I," and "C," and ask you whether they are all of them now in the same condition that they were in when you first saw them at Drawbaugh's shop.

A. That is a question I cannot answer, because there may be some parts of them taken away that I didn't notice. The boxes and appearance resemble those that I saw. I remember one was broken, when I saw them here yesterday; [the instrument "G" is now also shown to the witness.] I don't remember seeing the broken one at Mr. Drawbaugh's. That instrument "G" is the broken one that I saw yesterday. I don't remember whether a bottom cover was on instrument "D" or not. I just took up the machines and looked at them in this way [holding an instrument up and looking at it with the mouthpiece towards him.] I didn't think I was expert enough to pick any flaw in it.

Cross-Q. 97. When you saw them at Drawbaugh's shop, did you look at their insides, so as to examine and know what the works were inside of each of them?

A. Do you mean, did Mr. Drawbaugh or myself take them apart? No.

Cross-Q. 98. Are you quite sure that you never tried to transmit or hear anything transmitted by any of these machines, except the trial of "F" and "B," which you have mentioned?

A. No, sir; only that one.

Cross-Q. 99. Did you see any of the others at Drawbaugh's shop connected up with wires and batteries, ready to be talked through; and if so, when, and which ones?

A. I seen them connected with wire. Battery—I didn't take notice anything about battery, because I would merely just look at the mouthpiece, or to see that they were improved. There was a difference between the box "B" there and those that I saw. I couldn't say just when. I couldn't give accurate time or date. I couldn't say which; I think I saw "A;" I may have seen "E;" I saw several; I couldn't tell just which ones.

Cross-Q. 100. Where was "A" when you saw it connected with another instrument by wires?

A There is a question I can't answer you; I don't know whether it was connected with any other instrument—that I can't tell; it was up in the shop, where he manufactured his electric clock; it was in the third story, I think, when I heard "B;" there were two rooms on the third story, and that afterwards the room I heard "B" in was partitioned off into two rooms, in one of which the electric clock was, and in that room I think I saw "A" on that occasion.

Cross-Q. 101. Didn't you ever hear or see "A" used at Drawbaugh's shop?

A. No, sir; I did not see it used.

Cross-Q. 102. Did not Drawbaugh explain to you how it was to be used?

A. He did, I think; he told me that you put that to your ear, that way, [witness indicates by holding the instrument up with the mouthpiece against his ear.]

Cross-Q. 103. Have you ever seen more than one electric clock at Drawbaugh's?

A. I did.

Cross-Q. 104. About how many?

A. I might have seen a half a dozen; I might have seen more than that; I saw an improvement on them, too, in the cases and in the works.

Cross-Q. 105. When, as near as you remember, did you first see an electric clock there?

A. It might be four or five years ago; it might be longer; it mightn't be that long.

Cross-Q. 106. Who made them and who invented them?

A. Mr. Drawbaugh told me he made them; I never saw him working at them—not at the clock; I saw him working at a case once; he showed me some works of a clock there, which I supposed that he had

PHONE COMPANY,-1

made. He told me that he invented them; and that is the general belief about it—that is my belief.

Cross-Q. 107. Did you ever see any other things that you understood he invented and made?

A. The first thing I seen that he had invented was a stave-cutter; the next was a jointer, to joint staves, and the next was a molasses faucet, to measure molasses accurately while drawing it; the next thing was a pump, to pump water—a force pump. Since that he has made an improvement on his pump; he has quite another pattern. I think, if my memory serves me right, that the first thing he made was a machine to take daguerreotypes. The first that I saw I couldn't enumerate; a lot of little machines that he had there about the shop. He made a little machine to knot rags for carpet, in place of sewing them. Then he showed me, also, one time that I made a visit to his shop, he told me, he says, "I have got a machine that will give notice when the house is on fire." He took a piece of pine, probably six inches long, and something like a piece of plastering lath, and he had a green coil of wire connected with it—the color of that there [indicating electro-magnet of machine "B;] he said, "I put this to the stove, and whenever it gets browned to a certain degree of heat, why, the bell would ring in the other room." I said to myself, "Dan, you're going to be fooled this time;" but he tried it, and when the wood became brown, sure enough, the bell did ring. I thought at first it was one of his wild notions.

Cross-Q. 108. Do you remember any machinery of his for dressing mill-stones?

A. I do; I think he invented it; it is called the Drawbaugh machine, anyhow, or used to be.

Cross-Q. 109. Do you remember an invention of his in making a self-feeding nail machine?

A. Yes, sir; I remember; I have seen it in operation.

Cross-Q. 110. Were any of these things that you have referred to manufactured at his shop for sale?

A. Yes, sir; the faucet was, the stave jointer, stave-cutter, pump, and clock.

Cross-Q. 111. Did he patent any of these things you have mentioned?

A. The stave-jointer and cutter were patented; whether he got it done or not I can't say.

Cross-Q. 112. Were any of them patented as his inventions, and if so, which ones?

A. Yes, sir; all that were patented were patented as his inventions, to the best of my knowledge; the stave-jointer and cutter, and molasses faucet, pump, also, I think—I am not certain; I don't know whether the others were patented or not, I never took notice.

Cross-Q. 113. Why did you go to his shop when you wanted a magic-lantern?

A. The reason why was that Dan had one, and I knew he could tell me all about it; I knew he was acquainted with such things more than anybody else in our neighborhood; that was his general reputation; when we wanted anything particular we went to Dan; I had all confidence in him that he would tell me the truth—that is his general reputation.

[*Recess for dinner.*]

---

2 *o'clock, P. M.*

Examination resumed; same counsel present.

Cross-Q. 114. Look at instrument "B," and tell me what is the use of the long strip of tin underneath the block on which the magnet rests?

A. I don't know; as I told you awhile ago, I was no expert; I didn't take notice of that, either.

Cross-Q. 115. Have you made an affidavit at any time about Drawbaugh's talking machine?

A. Yes, sir.

Cross-Q. 116. When and where?

A. At Lisburn, Cumberland county; I couldn't give you the date; this last spring; I don't know whether it was in December, 1880, or January, 1881. By looking at a memorandum furnished by Mr. Hill I can give the date; it was November 19, 1880.

Re-direct examination by Mr. Hill:

Q. Q. 117. In answer to cross-question 112, with reference to the patenting of Mr. Drawbaugh's stave-jointer, stave-cutter, faucet, &c., and in answer to other questions in the cross-examination relating to the patenting of those inventions, in which answers you stated that some of them were patented, had you any actual knowledge of your own that they were patented, or did you state the fact from hearsay?

A. I have no actual knowledge of my own, but stated it just from hearsay.

IONE COMPANY,-1

[*Mr. Hill states that he objects to all the evidence brought out on cross-examination, relative to the patenting of other inventions than the talking machine, on the ground that such evidence is secondary.*]

Examination taken, reduced to writing, and sworn to and subscribed by the witness before me, this 23d day of April, 1881.
FRED. M. OTT,
Examiner.

M. P. SMYSER.

URIAS R. NICHOLS, *being produced, affirmed, and examined, saith, in answer to interrogatories, as follows:*

Q. 1. State your age, residence, and occupation.

A. Thirty-nine years; residence, Newberry township, York county, Pennsylvania; farming and brick-making is what I am following at present; my regular occupation is that of a machinist.

Q. 2. When did you commence to reside near Newberry, York county?

A. The 15th of July, 1874.

Q. 3. Prior to that time, what had you been doing?

A. Assistant signal-station and light-house keeper at Miller's Island, near Baltimore.

Q. 4. Were you in Harrisburg, Pa., in the month of January, 1875—if so, for what purpose?

A. I was; for the purpose of seeing Mr. Stevens, member of the Legislature.

Q. 5. Why did you want to see him?

A. Under the new Constitution, he thought a special law could be passed respecting private roads.

Q. 6. Did you go to see him with reference to getting such a law passed?

A. Yes, sir.

Q. 7. At that time—January, 1875?

A. Yes, sir.

Q. 8. How long had the Legislature then been in session when you went to see him?

A. It was in the second week of the session.

Q. 9. How do you fix the time as in the second week of the session?

A. Mr. Stevens mentioned that they had been in session only a few days, and the committees were not all appointed and organized.

Q. 10. Did he say anything from which you fixed the time as in the second, instead of the first, week of the session?

A. He did. He said the first week had been principally occupied in organizing the House and its subordinate officers and that they had adjourned over Sunday.

Q. 11. How long were you in Harrisburg on that trip?

A. I came in the morning, and left about eleven o'clock the same day.

Q. 12. Did you make any purchase while here in Harrisburg on that trip; and if so, what was it?

A. Not in Harrisburg. I purchased, on my way home, lime from Hake.

Q. 13. Are you able to fix the date of that purchase?

A. Not definitely to the day.

Q. 14. Are you able to fix the day when you received the lime so purchased?

A. Yes, sir.

Q. 15. What was the day, and how do you fix the time?

A. It was the eighteenth day of January, 1875. I fix it by the date of an entry of its receipt on my book.

Q. 16. When did you last refer to that book to refresh your memory as to the date?

A. On Wednesday evening last.

Q. 17. On your way home on that trip, did you or not stop at the shop of Daniel Drawbaugh, at Eberly's Mills, Cumberland county?

A. I did.

Q. 18. Did you, then and there, see any of the instruments now on the table before you? If you did, please point out the particular instrument or instruments which you saw.

A. I did see two of the instruments before me—these [indicating "A" and "B."]

Q. 19. Did Mr. Drawbaugh then and there tell you what those instruments were for?

A. He did.

Q. 20. What did he say they were for?

A. A talking-machine.

HONE COMPANY,-1

Q. 21. Did he explain to you the principle upon which they were operated?

A. He did.

Q. 22. What was his explanation, so far as you remember it?

A. That the sound was conducted by electricity, and the waves of sound imparted to a thin substance in the machine, as the parchment with which this end [indicating the end of the tin box next to the electro-magnet of machine "B"] of the machine was then covered.

Q. 23. Do you mean for us to understand that the sound waves were conveyed by electricity, and imparted to the parchment that was stretched over the end of the tin box next to the electro-magnet, in the machine marked "B?"

A. That is what I understood him to explain.

Q. 24. Did you, at that time, hear any conversation carried on by means of these machines, or either of them?

A. I did by this one [indicating machine marked "A."]

Q. 25. While that conversation was carrying on, was the machine marked "A" connected to anything; if so, how?

A. It was; with two wires, to those posts here, fastened with screws, [indicating the two binding posts of the machine marked "A."]

Q. 26. Were the wires connected with those two binding posts before you went there, or was the connection made in your presence, while you were there?

A. Made in my presence, while there.

Q. 27. By whom?

A. By Mr. Drawbaugh.

Q. 28. When you were listening to the conversation which was carried on through the machine or machines, while there, which of the machines did you use while listening?

A. This machine, [picking up machine marked "A."]

Q. 29. Show us how you used that machine when listening.

A. Holding it to the ear in that shape. [The witness picks up the machine marked "A," and holds it with the mouthpiece against his ear.]

Q. 30. What did Mr. Drawbaugh do when you took that machine up and held it against your ear—I mean, what did he do to start the conversation which you heard?

A. He opened a small box that was setting in a closet or cupboard, and spoke as though he was speaking into the box.

Q. 31. Then what did you hear?

A. I heard the voice of a boy saying: "Is it you, father, speaking?"

Q. 32. Where did you hear the boy's voice;—was it in the instrument at your ear?

A. It was.

Q. 33. Did you, while there, see the boy, or see the instrument into which he was speaking?

A. I did not.

Q. 34. Did Mr Drawbaugh, at that time, tell you how far the boy was away from you, when he was speaking and you listening?

A. In answer to my question as to how far he was away, he said it was two hundred feet, or at least two hundred feet of wire, between me and the person speaking.

Q. 35. Did Mr. Drawbaugh, at that time, tell you how long he had had the instrument marked "A?"

[*Objected to by Mr. Storrow, as incompetent, as secondary*]

A. In answer to my question as to how long he had been using this instrument [indicating instrument "A"] he said he had been working at it or using it about sixty days, and then taking up this instrument [indicating instrument "B"] he said he had had it about three or four years.

Q. 36. Did you see instrument "B" operated while you were there at that time?

A. I did not.

Q. 37. Was instrument "B" in the same room with you, while you were listening at instrument "A?"

A. It was laying on the same table on which the other was; he took it from the same cupboard.

Q. 38. Was it connected with wires?

A. It was not.

Q. 39. Am I to understand you that there were three instruments in the room with you, to wit: the box into which Mr. Drawbaugh spoke to the boy, the instrument "A," by which you heard the boy answer back, and the instrument "B," which was lying on the table or bench?

A. From what I saw, there were the instruments "A" and "B," and whatever was in the box was a third one or thing; I didn't examine it.

Q. 40. What was the appearance of the wires which Mr. Drawbaugh, in your presence, connected to the binding posts of the instrument "A?"

A. They seemed to be ordinary copper wires covered with some green substance.

HONE COMPANY,-1

Q. 41. State whether, while you were there, you saw a battery connected with the wires.

A. He showed me a battery that was sitting under the table or work bench, on a small bench, and told me that it was a battery that conducted the electricity, and that it was connected with the machines.

Cross-examined by Mr. Storrow:

Cross-Q. 42. After that visit to Mr. Drawbaugh's shop, did you tell anybody what you had seen and heard there?

A. I think I told Mr. Croll and Mr. Mash (or Maish.)

Cross-Q. 43. Who are they, and where do they live?

A. Mr. Croll is a neighbor of mine, living near Newberry, and Mr. Mash is an attorney, living in York.

Cross-Q. 44. When did you tell them about it?

A. Some time during the winter, when we were in conversation concerning Mr. Drawbaugh and his burr-dressing machine.

Cross-Q. 45. How did you come to talk with them about his burr-dressing machinery?

A. Mr. Croll is a mill owner, and was with me in Mr. Mash's office; his errand in town, he said, was to purchase some bolting cloth; I asked him, I think, whether he used Drawbaugh's burr-dressing machine.

Cross-Q. 46. How did you come to know of Drawbaugh's burr-dressing machinery?

A. I had seen it in use at Mr. Kunkle's mill, at Lisburn.

Cross-Q. 47. Did you ever talk with any one else about these two instruments, "A" and "B," and what you saw and heard at Drawbaugh's on that occasion?

A. I am not able to say whether I did or not.

Cross-Q. 48. When did you next see either of these instruments, "A" or "B," after that occasion?

A. This winter, when Mr. Drawbaugh brought them up to my place.

Cross-Q. 49. Did you ever see Drawbaugh between the occasion referred to and the time when he came to your place in the winter?

A. But once.

Cross-Q. 50. When was that?

A. Some two years, or near that, ago.

Cross-Q. 51. Did you have any conversation then about his talking machines?

A. We did not.

Cross-Q 52. Where was it you saw him then?

A. At Mr. Hake's, in the upper end of York county, about two and a half miles from Eberly's Mills.

Cross-Q. 53. Had you ever seen Drawbaugh before the occasion when you saw these instruments, and which you say was in January, 1875?

A. Yes, sir.

Cross-Q. 54. When and where?

A. A number of times here in town, and at sales in the upper end of York county, and meetings there.

Cross-Q. 55. How far from Eberly's Mills did you live then?

A. Eight or nine miles.

Cross-Q. 56. Eberly's Mills is quite close to the line of upper York county, isn't it?

A. Yes, sir.

Cross-Q. 57. How came you to go to Drawbaugh's shop on the occasion referred to?

A. With Mr. Millard, who had business at Eberly's Mills, who was going by Hake's and near to my place.

Cross-Q. 58. Who was present and witnessed this use of "A" and "B," which you have described?

A. A gentleman who was working in the shop at some other business; he was a stranger to me.

Cross-Q. 59. Wasn't Millard present?

A. No, sir; Millard was not present. When he was through with his business he called at the shop for me, and we started in a few minutes.

Cross-Q. 60. Then Mr. Millard's business was not at Drawbaugh's shop?

A. No, sir.

Cross-Q. 61. How did you happen to go to Drawbaugh's shop, instead of staying with Mr. Millard?

A. To see the electric clock, of which I had read a description in the papers.

Cross-Q. 62. What papers had you read a description of it in?

A. In one of the Harrisburg papers.

Cross-Q. 63. How long before?

A. Some two or three months, I think.

Cross-Q. 64. Do you remember which paper?

A. I do not.

PHONE COMPANY,-1

Cross-Q. 65. Have you been in the habit of reading the Harrisburg papers—any of them?

A. Most always in coming to town to market I buy a morning paper.

Cross-Q. 66. How often have you been in the habit of coming to Harrisburg to market?

A. In the after part of the summer and fruit season, once and twice a week, and in the winter often not more than once a month.

Cross-Q. 67. What was it that you saw in the paper about the clock?

A. Account of a clock invented by Drawbaugh that was run by electricity, and required no winding.

Cross-Q. 68. Did you see the clocks at Drawbaugh's on that occasion?

A. I saw two clocks, but they were not running.

Cross-Q. 69. Were they in the same room as "A" and "B?"

A. They were.

Cross-Q. 70. What other business was being carried on at Drawbaugh's shop on that occasion?

A. I do not know.

Cross-Q. 71. In your forty-ninth answer, you say that you never saw Drawbaugh but once in the six years after your visit, and in your fifty-fourth answer you say that between the time you moved to Newberry and 1875, which I understand to be about six months, you saw him a number of times. I wish you would explain how it happened that your meeting with him ceased so suddenly, and for so long a time.

A. Not from the time I moved to Newberry, but from 1866 to 1869 I saw him a number of times.

Cross-Q. 72. How long ago did you first know him?

A. I have known Drawbaugh, by sight, since about 1860.

Cross-Q. 73. Then I understand you to say that from 1866 to 1869 you saw him frequently?

A. Yes, sir.

Cross-Q. 74. And how often did you see him between 1869 and 1875?

A. Not at all.

Cross-Q. 75. Have you told us all that he said to you about his talking-machine, on the occasion of your visit to his shop, in January, 1875? If not, please tell me everything else that he said, that you can remember.

A. I think that I asked him whether it would take the place of the telegraph on the signal service from one post to another, and he said he didn't know how it would work on long distances. I think he said he hadn't tried it at any great distance, but if he could get it perfect enough to get others to take hold to help him to introduce it, he thought it would answer to communicate between places of business in cities.

Cross-Q. 76. I suppose you have read in the papers, from time to time, about the use of speaking telephones in Harrisburg and other cities.

A. I saw a description some two or three years ago in the *Scientific American*, of a speaking telephone.

Cross-Q. 77. Don't you think it was four years ago that you saw it in the *Scientific American?*

A. I do not know, but I do not think it was so long as four years ago; I do not recollect of reading *Scientific Americans* four years ago, as I had but little interest in such things at that time.

Cross-Q. 78. When did you begin to read the *Scientific American?*

A. Between two and three years ago.

Cross-Q. 79. Have you read it pretty generally ever since?

A. I have not read it generally; I have read it once or twice a month, if I could get them at the book-store, or from other parties who were subscribers.

Cross-Q. 80. Whose telephone was it, or what kind of a telephone was it, that you saw in the *Scientific American?*

A. I don't recollect whose, but it runs in my mind it was Edison's.

Cross-Q. 81. I suppose, after you saw that article in the *Scientific American*, you have seen in the Harrisburg or other papers, references to the use of the speaking telephone in the community; haven't you?

A. I may have, but I don't recollect; I didn't task my memory with it, until this last fall, when there was an account in our county paper of the establishment of a telephone system in our borough of York.

Re-direct examination by Mr. Hill:

Q. Q. 82. State whether you are, or are not, sure that the paper was published in Harrisburg, in which you saw the description of the electric clock.

A. I am not positive, but I think it was; I can't be positive whether it was a Harrisburg paper or not.

Q. Q. 83. The examiner will now read your 75th cross-answer to you, and then ask you whether you are sure that that contains the exact purport and meaning of his remarks, or whether the meaning may have been modified by other remarks which you do not remember.

[*Objected to by Mr. Storrow, on the ground that it is leading, that it*

HONE COMPANY,-1

assumes that to be a fact which has not been testified to, and asks the witness to give a meaning to alleged remarks which no one has testified, were made, and which witness has testified he does not recollect ever were made.]

A. From what I recollect at present, it conveys the idea that I received from the conversation between me and him, as regards himself being too poor to complete and introduce it; that is what I inferred from it, that he was too poor to test it at great distances, and to complete and introduce it.

Q. Q. 84. How long was the interview between you and Mr. Drawbaugh, at the shop, when he exhibited to you the operation of the machine?

A. I am not able to say how long we conversed about that; I was in the shop about the space of two hours.

Q. Q. 85. Was there, or was there not, on that occasion, a good deal of talk between you and Mr. Drawbaugh about the talking machine, but which you are not able now to remember and to state in your testimony?

[*Objected to by Mr. Storrow, on the ground that it is not competent for the party producing a witness to prove that he is not able to give a substantially correct account of the interview which the party has called him to prove.*]

A. After he laid the instrument back in the case, and closed it up, the conversation between us was concerning the artificial arm which I now wear, and other machinery, of which I cannot now call to mind the particular points.

Examination taken, reduced to writing, and sworn to and subscribed by the witness before me, this 23d day of April, 1881.
FRED. M. OTT,
Examiner.

URIAS R. NICHOLS.

Adjourned until Monday, April 25th, at half-past 9 o'clock, A. M.

April 25, 9.30, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Smith, for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs, for respondents.

JACOB B. FRY, *being produced, affirmed and examined, saith in answer to interrogatories, as follows:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is twenty years; Shiremanstown, Cumberland county, Pa.; occupation laboring.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.?

A. Yes, sir.

Q. 3. How long have you known him?

A. Since 1875.

Q. 4. What is your father's name?

A. Jeremiah Fry.

Q. 5. Have you always made your home in your father's family?

A. Yes, with the exception of a few months, when I was hired away from home.

Q. 6. Did your father formerly live at Eberly's Mills; if so, from what time to what time?

A. From the year 1875 to the year 1880.

Q. 7. What time in the year 1875 did he move to Eberly's Mills?

A. In the last days of March, or not later than the first of April in the year 1875.

Q. 8. Did you become acquainted with Daniel Drawbaugh before or after your father moved to Eberly's Mills?

A. After he moved to Eberly's Mills.

Q. 9. How soon after?

A. In a week or so after we lived there, I became acquainted with him.

Q. 10. Were you in his shop frequently?

A. Yes, sir.

Q. 11. Did you ever see any talking-machines there in his shop?

A. Yes, sir.

Q. 12. How soon after you went there to live, did you first see talking-machines in his shop?

A. Several months afterwards; it must have been the latter part of May or June; I am not able to say, or to give the correct time.

Q. 13. Do you remember what kind of weather it was about that time, whether warm or cold?

A. Warm, I think.

Q. 14. What were you doing at the time when you first saw the talking-machine?

A. When I first saw it I wasn't doing anything; only I was down on a visit to see the shop.

Q. 15. Did you at one time do any work in the shop for Harman Drawbaugh?

A. Yes, sir.

Q. 16. How long did you work for him?

A. That is more than I am able to say, to give the correct time, but it may have been a week or two.

Q. 17. When was it that you worked for Harman Drawbaugh?

A. In the year 1875.

Q. 18. Was it warm or cold weather at that time?

A. Warm, I think.

Q. 19. What makes you think so?

A. Because we came back from the shop with our coats off, still, at noon.

Q. 20. While you were so working for Harman Drawbaugh, did you see any talking-machines in the shop?

A. Yes, sir; I did.

Q. 21. Do you remember what kind of machines they were—how they looked?

A. Yes, sir; they were round, with a curled magnet in them, as I recollect.

Q. 22. How many of them were there of that particular kind, that you remember seeing at that time?

A. Two.

Q. 23. Please examine the two instruments which I now show you, marked "D" and "E," and state whether you ever saw them before, and if so, when first?

A. Those are the two with the curled magnets in them, that I saw when I worked for Harman Drawbaugh, and before that time.

Q. 24. Did you hear any talking carried on through those two instruments, at that time?

A. I heard talking through instruments, but can't say whether those, at that time; I heard talking through those since.

Q. 25. But you saw those two instruments at that time; is that your meaning?

A. Yes, sir.

Q. 26. What other instrument did you see at that time, or before that time? Did you see this instrument, "B," or this, "F," or this, "A?"

A. No, sir; not that I remember of.

Q. 27. Do you remember what the conversation was that you heard carried on through speaking-machines, at the time when you heard conversation in that way?

A. I remember him saying that Harrisburg was situated on the banks of the Susquehanna river; those I heard plain and distinct.

Q. 28. Who said that?

A. Daniel Drawbaugh.

Q. 29. Did you hear anybody else talking through the machine?

A. I heard Mr. Drawbaugh and his son Harry talk through them together.

Q. 30. Did his son Harry talk to you at any time through the machine?

A. Not that I recollect of.

Q. 31. When you heard anybody talking through the machines, could you distinguish their voice from that of any other person or not?

A. Yes, sir; I could voices that I knew.

Q. 32. Do you mean by that that if you were familiar with the person's voice you would recognize it by the sound through the machine?

A. Yes. sir.

Q. 33. When you saw those instruments and heard the talking through them, were they connected in any way? If so, how?

A. With a wire.

Q. 34. What kind of a wire?

A. A small, thin wire; it was not a telegraph wire; it was not as heavy as that at that time.

Q. 35. Do you remember whether the wire was covered with anything or not?

A. I am not able to say whether it was or not.

Q. 36. Are you able to say whether the instruments were connected by one or two wires?

A. There was two wires, I think.

Q. 37. What time did your father move away from Eberly's Mills?

A. In the spring of 1880.

Q. 38. Between the time when you first saw the two instruments

"D" and "E" and the time when your father moved away from Eberly's Mills, did you see other talking-machines about Mr. Drawbaugh's shop?

A. Yes, sir.

Q. 39. During what part of that time—the first part, the last part, or all parts of that time?

A. I am not able to say what part of that time. I think, though, it was the latter part of 1878.

Q. 40. Between 1875 and the latter part of 1878, did you see any talking-machines there?

A. Yes, sir.

Q. 41. At what time or times, as near as you can state?

A. The year 1875, about May or June—along there.

Q. 42. Do you remember seeing any other machines between that time and the latter part of 1878?

A. Yes, sir.

Q. 43. When, as near as you can remember?

A. I can't give any time on that; I can't tell just what time.

Q. 44. Was it at one time or at different times?

A. At different times.

Q. 45. Was it one machine or a number of machines?

A. There was different machines that I saw at that time.

Q. 46. As you went into his shop, from the time when you worked for Harman Drawbaugh down to the year 1878, would you, from time to time, see talking-machines that you had not seen before, or was it always the same old machine?

A. There was new ones from that time up; of course, he didn't always have a new machine from the time I came in until I came in again.

Q. 47. But he did sometimes; is that what you mean?

A. Yes, sir.

Q. 48. Did you ever see this machine there, marked "H"?

A. Yes, sir; in the eastern part of the shop, in the corner; in the closet.

Q. 49. When did you see it there?

A. I am not able to say when I saw it there.

Q. 50. Did you at any time see machines and a line or lines of wires outside the shop?

A. Yes, sir.

Q. 51. When was that, as near as you can remember?

A. It was in the spring of 1879, as near as I can remember.

Q. 52. Do you remember what particular instruments were connected by those lines outside of the shop?

A. Yes, sir; that machine there [marked "H"] was one.

Q. 53. How long was the line of wires outside of the shop, as near as you can judge?

A. Between a hundred and two hundred yards, as near as I can judge.

Q. 54. To your best recollection, about how many machines did you see there between the time when you saw these machines marked "D" and "E" and the time when you first saw this machine marked "H"?

A. It is more than I am able to say, though I saw a number of them during that time; I may have saw them all, but I am not able to say.

Q. 55. Do you think you would be able to recognize any of them if you now saw them again?

A. No, sir; I would not be able to recognize them.

Q. 56. Please look at the machines now shown you, marked "G," "K," "L," "M," "N," and state whether you recognize any of them as having been seen by you.

A. No, sir; I am not able to recognize them.

Q. 57. Referring to the machines which you saw there, between the time when you saw these two machines, marked "D" and "E," and the time when you saw the machine marked "H," can you state whether or not, the machines which you saw there resembled in general appearance these machines marked "G," "K," "L," "M," "N," or any of them?

A. Not that I can—I can't refer to any of them between that time.

Q. 58. What is your best recollection of the appearance of the machines that you saw at that time—I mean the new machines that you saw from time to time, that you had not seen before?

A. I can't make any recollections of them; I didn't pay particular attention to them, no more than just that I saw them.

Q. 59. Do you remember talking through any of the instruments while the axle factory was still running there?

A. Not at that time, that I remember of.

Q. 60. Was the axle factory running when you first saw the instruments "D" and "E"?

A. I saw them whilst the axle factory was going on, lying on the work-bench together and a pile.

Q. 61. Explain what you mean by "together and a pile."

A. There is where I saw that curled magnet; the one was together like this [pointing to "E"] and the other was like this [pointing to "D"]; this part was off [pointing to bottom]; they was all lying together on the bench.

Cross-examined by Mr. Smith:

Cross-Q. 62. You say your occupation is laboring; what kind of labor are you engaged in, and at what kind of labor have you worked since you went to Eberly's Mills in 1875?

A. Well, I wouldn't be able to say just what I worked at; regular day's labor, in the machine-shop a little while, that is all.

Cross-Q. 63. Do you mean day's labor on a farm?

A. Yes, sir.

Cross-Q. 64. What did you do for Harman Drawbaugh when you worked for him?

A. Helped him at the patent axle.

Cross-Q. 65. Have you worked in any other machine-shop? If so, when and where?

A. No, sir; I have not worked in any other.

Cross-Q. 66. How long was the axle business carried on in that shop after you worked there?

A. I am not able to say how long.

Cross-Q. 67. Did you at any time see any other business carried on there while you were in the habit of going there?

A. Not in particular.

Cross-Q. 68. Well, if you saw any kind of work being done there by Mr. Drawbaugh or anybody else, while you were in the habit of going there, will you state what it was?

A. Yes; there was magnetic clocks, by Mr. Drawbaugh—so far as I know, by him.

Cross-Q. 69. Anything else?

A. Not that I recollect of.

Cross-Q. 70. When did you first see the magnetic clocks?

A. I am not able to say when.

Cross-Q. 71. Can you tell me how many of them you saw at any one time, or in all?

A. No, sir; I saw a number of them.

Cross-Q. 72. Did you see a number at one time?

A. Yes, sir.

Cross-Q. 73. About what time was it when you saw a number of them?

A. I am not able to say just when, or what time it was.

Cross-Q. 74. Give the year as nearly as you can, when you saw this number of them.

A. It was either in 1878 or 1879.

Cross-Q. 75. Was it before or after you saw the instrument marked "H?"

A. It was before.

Cross-Q. 76. How long before you saw this number of them was it that you first saw a clock of that kind?

A. I am not able to say how long.

Cross-Q. 77. Should you think it was a year before that?

A. No, sir; I think not.

Cross-Q. 78. Did Mr. Drawbaugh ever explain the clock to you, and tell you how it worked?

A. No more than just by electricity, I think.

Cross-Q. 79. Do you know who else worked on these clocks, making them, besides Mr. Drawbaugh?

A. George W. Drawbaugh worked at them, is all that I know.

Cross-Q. 80. How often do you think you were in Mr. Drawbaugh's shop during the years 1876, 1877, 1878, and 1879?

A. I do not know; I was in sometimes as high as twice a day, sometimes once a week, maybe.

Cross-Q. 81. When you first saw the talking instruments, did Mr. Drawbaugh tell you anything about them? If so, will you please state all that he told you?

A. No, sir; I never inquired.

Cross-Q. 82. At the time when you heard the conversation through them, which you have spoken of, what did he say about them?

A. Nothing that I remember of.

Cross-Q. 83. Do you remember anything else that was said through the instruments except that Harrisburg was situated on the banks of the Susquehanna river?

A. No, sir.

Cross-Q. 84. Was there anything else said?

A. Yes, sir; there was.

Cross-Q. 85. Was there a good deal said?

A. I don't remember just how much was said; there wasn't such a great conversation; only was there a little while.

Cross-Q. 86. How long should you think you were there at that time?

A. Probably fifteen or twenty minutes.

Cross-Q. 87. How came Mr. Drawbaugh to show you the instruments at that time?

A. Him and his son Harry was talking together as I came in the shop.

Cross-Q. 88. Where were the two instruments?

A. The one was in the west end of the corner of the shop, and the other was in the east end of the corner of the shop; the one in the west end in the corner was in the lower or first story of the shop, and the other was in the upper.

Cross-Q. 89. Which one did you listen to when you heard the words you have spoken of?

A. That I am not able to say which instrument; the one in the upper part of the shop.

Cross-Q. 90. Did you have any talk with anybody after that about what you had heard?

A. I may have, but don't remember of any.

Cross-Q. 91. When were you first spoken to about giving your testimony in this case, or about what you had heard or seen at Mr. Drawbaugh's shop?

A. I am not able to say just when.

Cross-Q. 92. State, as nearly as you can, who it was that first spoke to you about it.

A. Do you mean about this here, or in the beginning?

Cross-Q. 93. In the beginning, state who spoke to you, about what you had seen at Drawbaugh's shop, and about testifying.

A. Why, Mr. Jacobs, here, as near as I can understand that, and Mr. Daniel Drawbaugh, was the only two that I knew, that spoke to me.

Cross-Q. 94. State, as nearly as you can, how long ago that was.

A. That was about between two and three months ago, as nearly as I can recollect; I wouldn't be positive about that.

Cross-Q. 95. When you saw the other machines, which you did in the following years, what did Mr. Drawbaugh say to you about them?

A. I don't remember of him saying anything to me about them at that time or afterwards.

Cross-Q. 96. When you saw the machine marked "H," did Mr. Drawbaugh show it to you, or did you happen to see it as you went into the shop?

A. I happened to see that; he didn't show that to me.

Cross-Q. 97. Did you open it and see the inside of it?

A. No, sir; I did not.

Cross-Q. 98. How many times did you see it?

A. I saw it several times in the shop, and once down along the creek, on a stump.

Cross-Q. 99. Do you remember what kind of an instrument was connected with it by wires at any time you saw it?

A. No, sir.

Cross-Q. 100. What was being done with it when it was down on the stump?

A. No more than there was one or two wires attached to it; there was nothing done with it when I saw it; I just passed by.

Cross-Q. 101. You have spoken of having seen, at different times, several instrument between the times when you first saw "D" and "E" and the instrument "H;" where were these instruments at the times you saw them?

A. They were laying on the work-bench in the shop.

Cross-Q. 102. Were they in the same room where the clocks were, or where work was done on the clocks?

A. I don't remember of seeing them while the clock was in there.

Cross-Q. 103. Did you see them before you saw the clocks or afterwards?

A. I wouldn't be able to say; I think it was before, though.

Cross-Q. 104. Can you tell me how long the clocks were there, or how long work was being done on them?

A. No, sir.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 25th day of April, 1881.
FRED. M. OTT,
Examiner.

JACOB B. FRY.

Adjourned until two o'clock, P. M.

HONE COMPANY,-1

April 25th, 2 P. M.

Examination resumed, pursuant to adjournment.

Present, the same counsel.

JONATHAN BALSLEY, *being produced, affirmed, and examined, saith, in answer to interrogatories, as follows:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is sixty-three; residence, Cumberland county, in Shiremanstown. My former occupation was blacksmithing; I have no occupation, hardly, now.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county?

A. Yes, sir; I do.

Q. 3. Were you ever at his shop, at Eberly's Mills?

A. Yes, sir.

Q. 4. Did you ever see any talking-machines at his shop, at Eberly's Mills?

A. I saw what he told me were to be talking-machines.

Q. 5. When did you first see them?

A. It was between the twenty-third of October and the twentieth of November, 1875.

Q. 6. How are you able to fix the fact that it was between the twenty-third of October and the twentieth of November, 1875?

A. The reason that I remember that is this fact I know: I was a blacksmith, carrying on and scarcely went anywhere. My wife died the day before the date of that publication [referring to notice of obituary on back of photograph card]. My wife died on the twenty-second day of October, 1875. Between that date and that I visited my son: I generally went about the first of November to visit my son, and stay with him. On account of the death of my woman, I did not get there as I formerly did, but know that I was there not later than the twentieth of November. That is the reason I know the time when I visited, between that time.

Q. 7. Where did you spend the Christmas holidays that year?

A. Down with my son, in Berks county.

[*Mr. Hill asks the examiner to certify that the witness, in connection with his sixth answer, exhibited a lady's photograph, with a printed slip pasted on the back of it, and the examiner so certifies.*]

Q. 8. Is this photograph, which you have exhibited here, a photograph of your deceased wife?

A. Yes, sir.

Q. 9. Did you paste on the back of it this slip or slips of paper, apparently from a newspaper?

A. Yes, sir; I did.

Q. 10. When?

A. The time during my stay with my son; that same winter.

[*Mr. Hill asks the examiner to certify on the record at this point an exact copy of the printed slip on the back of the photograph and identified by the witness.*] *The examiner certifies that slip reads as follows:*

Harrisburg, Pa., Saturday, October 23, 1875.

Sudden death.—Yesterday Mrs. Jonathan Balsley, residing near Shiremanstown, Cumberland county, dropped dead from heart disease. The deceased was a lady of excellent character, and possessed of many noble qualities. Her loss will be deeply felt, and she will be long mourned and missed by her family and friends.

Q. 11. How came you to go to Mr. Drawbaugh's shop after the death of your wife, and before you went to visit your son?

A. Because I was bereft of a companion, and I was troubled. My friends got me to go round and visit where I had been living so long, in order to get rid of this trouble and find relief. That is the cause I went away—just to seek relief. My friends desired me to do so.

Q. 12. Had you formerly lived for a great while at Eberly's Mills?

A. Yes, sir; I lived there from 1833 to 1851.

Q. 13. Was that the first place you went to to divert your mind from your recent troubles, or did you go somewhere else first?

A. No, sir; I went to Milltown first.

Q. 14. By Milltown you mean Eberly's Mills, do you?

A. I do.

Q. 15. Do you recollect the appearance of the talking-machine that you saw at Mr. Drawbaugh's shop when you went there on that occasion?

A. I do, some of them, distinctly.

Q. 16. Can you mention any peculiarity of the machines, or any of them, at that time, that you remember?

A. Yes, sir; I could. If you give me a piece of paper I could describe what I never saw elsewhere. They were a round piece of wood; back of it an iron came around in curious form; I don't know what it were; I shouldn't have known what to do with it if I had picked it up anywhere else. [The witness illustrates his description of the pieces of iron by moving his finger around in a spiral curve.]

HONE COMPANY,-1

Q. 17. Please look at the instruments "D" and "E," now shown you, and state when and where you first saw them.

A. These irons; I saw such a machine, [holding up instrument "D,"] I wouldn't like to swear that was the one, but I saw such material in the shop.

Q. 18. What do you mean by such material?

A. Well, [pointing to the curled magnet on the back of instrument "D,"] I never saw such a thing as that, till I saw it there in that shop.

Q. 19. Do you remember whether the instrument that you then and there saw in that shop, having the curled iron on the back of it, had also the circular mouth-piece on the opposite side of it?

A. Yes, sir; it had a mouth-piece.

Q. 20. Did Mr. Drawbaugh tell you what it was for—I mean the instrument that you saw?

A. He just told me it was for a talking-machine.

Q. 21. Did he talk through it, to show you how it was to be used?

A. No, sir; he didn't talk through it, but he put it to his mouth, and also to his ear; applied it to his mouth and then to his ear.

Q. 21½. Did he explain to you the principle on which it operated?

A. Yes, sir; he gave me an explanation, but I couldn't say what explanation he gave me; I really couldn't do it.

Q. 22. Because you didn't understand his explanation, or because you don't remember it?

A. No, sir; it was beyond my comprehension. That is just the long and short of it; it was too deep for me.

Q. 23. Did he tell you whether it was operated by electricity or not?

A. That matter was talked over; I think I asked him that question.

Q. 24. What did you ask him, and what did he reply?

A. I asked him how it worked, first of all, when he replied, but I couldn't tell you the answer, at all.

Q. 25. Did he tell you how far he could talk through it from one place to another?

A. I can't remember that he did.

Q. 26. When was it that you first saw that instrument, with the curled iron on the back of it, like the instrument "D"?

A. In 1875, between October the twenty-second, and the fifteenth or twentieth of November, but I can't tell you what day.

Q. 27. Have you been able to fix the date of your wife's death by any other thing except the newspaper slip on the back of your wife's photograph ?

A. Yes, sir; if all of you gentlemen go along with me to St. John's cemetery, you can see it, there on the tomb-stone, and also in the family Bible.

Q. 28. Have you referred to the tomb-stone and the record in the family Bible within a few days, to see whether the newspaper date was correct?

A. I have, and found the newspaper date to be correct.

Q. 29. At the time when you saw that machine with the curled iron on the back of it, did you see one or more than one instrument—talking-machine instrument, I mean?

A. Yes, sir; there was a couple of them.

Q. 30. Did you mean a couple that looked alike, or different?

A. A couple that looked alike in shape.

Q. 31. Do you remember whether you saw this instrument "B" there at that time?

A. I cannot remember that thing as well as I can the others, because, being a little in my line of business, I remembered them. But he showed me a great many things.

Q. 32. Do you mean being in your line of business because they had pieces of iron on them?

A. Yes, sir; the peculiarity of them.

Q. 33. Do you remember anything about this glass instrument "F," at that time?

A. Yes, that I remember distinctly.

Q. 34. Do you remember anything about this instrument "A" at that time?

A. No, sir; I couldn't be nearly so positive about that.

Q. 35. Do you remember whether Mr. Drawbaugh, at that time, said anything about batteries in connection with these machines?

A. I do not remember, there was so much said.

Cross-examined by Mr. Smith:

Cross-Q. 36. What other kind of machinery did you see while at Drawbaugh's shop?

A. I don't think there was anything under consideration except this.

Cross-Q. 37. Did you see any kind of business going on?

A. He told me that he was making improvements to this machine. That is about all that I can remember.

Cross-Q. 38. When did you next see the machines "D" and "E?"

A. I could not tell you the date when I saw them; I could not do it.

Cross-Q. 39. Can't you give me some idea when it was?

A. I might give you my idea, and it might be a very wild one, too.

Cross-Q. 40. Give it as nearly as you can.

A. Well, I can guess at it. It might be that I never saw them till two months or three months ago; I can't tell you. I never saw them till that time, or, maybe, not so long ago.

Cross-Q. 40½. Do you remember anything else that Mr. Drawbaugh told you about them at the time he showed them to you?

A. Indeed, I cannot tell you, from the fact that there was so much said.

Cross-Q. 41. Do you remember whether he told you what he intended to do with them when he had made his improvements?

A. No, sir; he didn't, but I suppose he calculated to make something out of it; he generally did.

Cross-Q. 41½. Did you know about any of his inventions that he had made before that time?

A. Yes, sir.

Cross-Q. 42. And what ones?

A. There was the stave-jointer, stave-cutter, and also the faucets.

Cross-Q. 43. Did you know of his making any other inventions after that time?

A. He had a force-pump, and, I guess, an electric clock was an invention; I—there was quite a number of others, but I left the place and haven't been about there.

Cross-Q. 44. Did you see his force-pump and electric clock?

A. Yes, sir; I did.

Cross-Q. 45. Where did you see them?

A. I saw the one in his own shop, and the force-pump at Mr. Sherbane's own farm.

Cross-Q. 46. You mean, then, that you saw the clock at his own shop?

A. Yes, sir; that is what I mean.

Cross-Q. 47. Do you remember when that was?

A. I don't suppose that it was since last winter a year that I saw the clock.

Cross-Q. 48. Do you mean that you saw it since last winter, or that you saw it before that time?

A. Last winter a year ago, I said.

Cross-Q. 49. Did you see more than one clock?

A. Yes, sir.

Cross-Q. 50. How many of them?

A. I couldn't tell.

Cross-Q. 51. Do you remember whether you saw them more than once?

A. I saw them twice—the clocks.

Cross-Q. 52. When was the first time you saw them?

A. One year last winter.

Cross-Q. 53. Have you seen any other machines of any kind which were made at Mr. Drawbaugh's shop since 1875?

A. No, sir; nothing of the kind.

Cross-Q. 54. Did you visit your son again the next year after your wife died?

A. I generally visit my son twice a year—sometimes three times.

Cross-Q. 55. How far did you live from Mr. Drawbaugh at the time your wife died?

A. It was called two mile and a half.

Cross-Q. 56. I suppose you have seen him frequently since he first showed you those talking-machines?

A. No, sir; not very frequently.

Cross-Q. 57. Occasionally?

A. Well, hardly that.

Cross-Q. 58. How often do you think?

A. I don't suppose I have had a conversation with him six times since I first saw them machines.

Cross-Q. 59. At any of those conversations, did you talk with him about the talking-machine?

A. Never, except once.

Cross-Q. 60. Now, when and where was that?

A. It was at the depot at Shiremanstown; I couldn't be so positive when: some time about January or February this year.

Cross-Q. 61. Who else was present?

A. There were others present, but no one had any conversation on the matter; it was separately—him and I.

Re-direct by Mr. Hill:

Q. Q. 62. When did you know about the stave-jointer, stave-cutter, and faucet; was it before you saw the little machine with the curled iron?

A. Yes, sir.

Q. Q. 63. Do you know whether he invented the force-pump before after you saw that machine with the curled iron?

A. Yes, sir; it was long before these machines.

Examination taken, reduced to
writing, and by the witness affirmed
and subscribed to before me this
25th day of April, 1881.
FRED. M. OTT,
Examiner.

JONATHAN BALSLEY.

Adjourned until 9.30, A. M., to-morrow.

Tuesday Morning, April 26.

Examination resumed, pursuant to adjournment.

CHRISTIAN EBERLY, *being produced, sworn, and examined, saith, in answer to interrogatories, as follows:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am sixty-four, going on sixty-five; I live at Shiremanstown, and am a farmer at the present time.

Q. 2. When did you first reside at the place now called Eberly's Mills, Cumberland county, Pennsylvania, and how long did you reside there?

A. In the fall of 1844 I went there, and moved from there in 1867.

Q. 3. Where did you move to in 1867?

A. To New Cumberland.

Q. 4. How long did you then reside at New Cumberland before you moved away from there?

A. Four years, less three months.

Q. 5. When you moved away from New Cumberland, where did you move to?

A. To Shiremanstown, the place where I now live, and have resided there ever since.

Q. 6. Can you give the year and month when you moved from Eberly's Mills to New Cumberland?

A. On the first of April, 1867.

Q. 7. Can you give the year and month when you moved from New Cumberland to Shiremanstown?

A. On the 22d of December, 1870.

Q. 8. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county; and if so, how long have you known him?

A. Since 1844; in 1844 I moved to there.

Q. 9. Before you moved to New Cumberland, did you ever hear Daniel Drawbaugh say anything about talking to a distance by electricity; and if so, what did he say?

A. I did; he said that sound could be conveyed by electricity.

Q. 10. Did he say anything about making a machine to do it?

A. Yes, sir.

Q. 11. State all that he said about it at that time, as near as you can remember.

A. I don't remember of him saying anything more than that. He said almost anything could be made; could start a clock; and then afterwards he spoke, then, more about it, after I was at New Cumberland.

Q. 12. When he was talking about it before you went to New Cumberland, do you remember whether or not he said anything about being then experimenting on conveying sound to a distance by electricity?

A. Yes, sir; he did.

Q. 13. Did you ever see any machines or instruments of his for talking to a distance by electricity?

A. I am not certain whether I seen before I moved to New Cumberland, but I am certain I seen several instruments soon after I moved to New Cumberland; I might have before I moved, but I am not certain.

Q. 14. Are you certain that you saw them while you yet lived at New Cumberland, before you moved to Shiremanstown?

A. Yes, sir; I am.

Q. 15. Please examine the two machines, "B" and "F," which I now show you, and state whether you ever saw them, or either of them, before; if so, state where and when you first saw them.

A. I seen these two first—these are the first I ever saw there—soon after I moved to New Cumberland, at Mr. Drawbaugh's shop, at Eberly's Mills, I saw them; there is another instrument besides this one, but these are the first.

Q. 16. When you first saw these machines, "B" and "F," did Mr. Drawbaugh tell you what they were for? If so, what did he say.

COMPANY,-1

A. To convey sound by electricity.

Q. 17. Did he state what kind of sound they would convey—whether spoken sounds or not?

A. Yes; he said by talking; he mentioned that it would answer the same as telegraphing.

Q. 18. Look at this machine marked "A," and state whether you recognize it as having been seen by you before the present time; and if so, state when you saw it, as near as you can remember.

A. I seen it—I seen this instrument while I lived at New Cumberland, but after I saw these other instruments—these other instruments I seen first.

Q. 19. How long do you think you saw this instrument "A" after you had first seen these instruments "B" and "F?"

A. I don't think it was a great while after.

Q. 20. Before you moved to New Cumberland, had you been interested with Mr. Drawbaugh, or in partnership with him, in any inventions or patents? If so, what?

A. Yes, I was; I was interested with him in a steam-injector, stave-cutter, balance-ryne, and a mill-tram; I believe that is all; also a nail-feeder; I forgot that.

Q. 21. What was the nature of the partnership between you and him with respect to all those inventions? What was Drawbaugh to contribute to the partnership property, and what were you to contribute?

A. I furnished the money for to get those patents on those inventions, and he done the work, and I was equal partner with him.

Q. 22. Then, are we to understand that Mr. Drawbaugh furnished none of the money to get those patents and introduce those inventions, but that you furnished the money therefor?

A. Yes, sir; I furnished all the money, for I don't recollect of him ever having any money; it's true.

Q. 23. When Mr. Drawbaugh showed you his talking-machines, or machines for conveying sound to a distance, state whether or not he proposed to you to go into partnership with him and furnish the money for that also, as you had, before that time, done on the other inventions.

A. Not altogether; he intimated that he would take me in.

Q. 24. Take you how?

A. As partner; as I did before that, still.

Q. 25. Did you decline the proposition or intimation?

A. I don't recollect as I said anything, or what I said.

A. On the first of April, 1867.

Q. 7. Can you give the year and month when you moved from New Cumberland to Shiremanstown?

A. On the 22d of December, 1870.

Q. 8. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county; and if so, how long have you known him?

A. Since 1844; in 1844 I moved to there.

Q. 9. Before you moved to New Cumberland, did you ever hear Daniel Drawbaugh say anything about talking to a distance by electricity; and if so, what did he say?

A. I did; he said that sound could be conveyed by electricity.

Q. 10. Did he say anything about making a machine to do it?

A. Yes, sir.

Q. 11. State all that he said about it at that time, as near as you can remember.

A. I don't remember of him saying anything more than that. He said almost anything could be made; could start a clock; and then afterwards he spoke, then, more about it, after I was at New Cumberland.

Q. 12. When he was talking about it before you went to New Cumberland, do you remember whether or not he said anything about being then experimenting on conveying sound to a distance by electricity?

A. Yes, sir; he did.

Q. 13. Did you ever see any machines or instruments of his for talking to a distance by electricity?

A. I am not certain whether I seen before I moved to New Cumberland, but I am certain I seen several instruments soon after I moved to New Cumberland; I might have before I moved, but I am not certain.

Q. 14. Are you certain that you saw them while you yet lived at New Cumberland, before you moved to Shiremanstown?

A. Yes, sir; I am.

Q. 15. Please examine the two machines, "B" and "F," which I now show you, and state whether you ever saw them, or either of them, before; if so, state where and when you first saw them.

A. I seen these two first—these are the first I ever saw there—soon after I moved to New Cumberland, at Mr. Drawbaugh's shop, at Eberly's Mills, I saw them; there is another instrument besides this one, but these are the first.

Q. 16. When you first saw these machines, "B" and "F," did Mr. Drawbaugh tell you what they were for? If so, what did he say.

COMPANY,-1

A. To convey sound by electricity.

Q. 17. Did he state what kind of sound they would convey—whether spoken sounds or not?

A. Yes; he said by talking; he mentioned that it would answer the same as telegraphing.

Q. 18. Look at this machine marked "A," and state whether you recognize it as having been seen by you before the present time; and if so, state when you saw it, as near as you can remember.

A. I seen it—I seen this instrument while I lived at New Cumberland, but after I saw these other instruments—these other instruments I seen first.

Q. 19. How long do you think you saw this instrument "A" after you had first seen these instruments "B" and "F?"

A. I don't think it was a great while after.

Q. 20. Before you moved to New Cumberland, had you been interested with Mr. Drawbaugh, or in partnership with him, in any inventions or patents? If so, what?

A. Yes, I was; I was interested with him in a steam-injector, stave-cutter, balance-ryne, and a mill-tram; I believe that is all; also a nail-feeder; I forgot that.

Q. 21. What was the nature of the partnership between you and him with respect to all those inventions? What was Drawbaugh to contribute to the partnership property, and what were you to contribute?

A. I furnished the money for to get those patents on those inventions, and he done the work, and I was equal partner with him.

Q. 22. Then, are we to understand that Mr. Drawbaugh furnished none of the money to get those patents and introduce those inventions, but that you furnished the money therefor?

A. Yes, sir; I furnished all the money, for I don't recollect of him ever having any money; it's true.

Q. 23. When Mr. Drawbaugh showed you his talking-machines, or machines for conveying sound to a distance, state whether or not he proposed to you to go into partnership with him and furnish the money for that also, as you had, before that time, done on the other inventions.

A. Not altogether; he intimated that he would take me in.

Q. 24. Take you how?

A. As partner; as I did before that, still.

Q. 25. Did you decline the proposition or intimation?

A. I don't recollect as I said anything, or what I said.

Q. 26. What I want to get at is, whether you accepted the proposition or not.

[*Objected to by Mr. Smith, because it assumes what Mr. Drawbaugh said to be different from what the witness has testified, and because the witness has already testified as to the response which he made to Mr. Drawbaugh.*]

A. I did not, and my reason for not accepting it—taking no part in it—was that the last invention, the nail-feeder, wasn't altogether completed, and he was still experimenting on that.

Q. 27. Can you state the time, or about the time, when Mr. Drawbaugh intimated that he would take you into partnership on the talking-machine?

A. About the last of—during the time I lived at New Cumberland—about the last of that.

Q. 28. You must be well acquainted with the people at Eberly's Mills. Will you tell me how large a place it is—how many families live there?

A. About fifteen or twenty.

Q. 29. Are they rich or poor people who live there?

A. Mostly poor.

Q. 30. Was the place named for you and your mills?

A. Yes, sir; when I moved there the place was called Milltown, and when I got there I got a post-office, and they put me in for postmaster, and called it "Eberly's Mills post-office." That is the way it came to be called. I also owned the property there, pretty much all of it.

Q. 31. Had there been a post-office there before, which had been abandoned, and which you got reëstablished?

A. Yes, sir.

Q. 32. When Drawbaugh showed you the machines for conveying sound to a distance, did he say whether or not he intended to take out a patent on it?

A. I don't recollect hearing him saying anything about it; I think he did.

Q. 33. Do you mean that you think he said something about it, but don't recollect what he said?

A. Yes; that is what I mean.

Q. 34. Were you at his shop between the year 1870 and the present time?

A. Yes; I was there during 1871, 1872, and 1873, frequently, but not very often since that.

Q. 35. When you used to go there frequently during the years 1871—'72—'73, did he say anything to you about the talking-machine?

A. He did; he said that he would have it completed.

Q. 36. Was he working upon it during that time?

A. I can't tell you that; I don't know after studying. He would always show me, and explain to me, but if you mean about working at it, I don't know how to put that in. I suppose he was working at it; he would always tell me about it. I didn't see him working at it.

Q. 37. What has been Drawbaugh's pecuniary condition down to the summer of 1880?

A. I am not able to tell that. I think he has been poor all the time.

Q. 38. Did you formerly know Mr. Lee, who was a brother-in-law of Governor Geary, and was his private secretary?

A. I did.

Q. 39. State anything you know about Mr. Lee's knowledge of, or connection with, this talking-machine invention of Mr. Drawbaugh's.

A. Mr. Lee and I frequently went from New Cumberland up to Mr. Drawbaugh's shop, and Mr. Drawbaugh would explain and show Mr. Lee, still, the workings of this electricity, and on the way home once Mr. Lee told me that he thinks Mr. Drawbaugh would like him to take an interest as a partner in this matter.

Q. 40. Is Mr. Lee living or dead?

A. He is dead.

Q. 41. When did he die, to the best of your recollection?

A. About 1872.

Cross-examined by Mr. Smith:

Cross-Q. 42. How far did you live from Mr. Drawbaugh's shop when you lived at New Cumberland, and how far after you moved to Shiremanstown?

A. About three miles to New Cumberland, and about three miles to Shiremanstown, where I live now.

Cross-Q. 43. Do you know whether Mr. Drawbaugh ever owned any real estate or had any other property of his own?

[*Mr. Hill states that he does not wish to object to this line of cross-examination nor to the question, except so far as it may call for secondary evidence. As Mr. Hill proposes to show hereafter, from the records of Cumberland county, what interest in real estate Mr. Drawbaugh had, and regarding said records as the best evidence, so far as they go, he objects to any oral testimony that may be substituted for them, as secondary.*]

A. I know that he bought a property at Mechanicsburg, but whether he paid for it, I don't know. I think his family lived there one year, and I think he since has sold the property. I don't know of him owning any now.

Cross-Q. 44. Do you know how much that property was worth?

[*Objected to by Mr. Hill, because the question does not discriminate as to whether the witness's actual knowledge of what the property was bought and sold for is inquired of, or whether the witness's opinion of the value of the real estate, as an expert, is inquired for; and if the latter is what is asked for, then the question is objected to because the witness is not first shown to be competent to testify as an expert upon such matters.*]

A. It might have been worth two thousand dollars.

Cross-Q. 45. Do you know when he bought it and when he sold it?

A. I think it is about five years ago that he bought it; I can't tell you when he sold it, or whether he really sold it; I am not certain.

Cross-Q. 46. Do you know whether he ever owned any real estate before he owned that?

A. I never knew him to own any before, nor I don't think he possibly could have owned any before; he lived right aside of me since 1844 up to 1867.

Cross-Q. 47. Do you know of his having any interest in a faucet business, that was carried on in his shop, in 1869 or 1870, or thereabouts?

A. Yes, sir, I do; Mr. Drawbaugh told me himself that he had an interest in it.

Cross-Q. 48. Do you know whether he managed the manufacturing business of the faucet company?

A. I suppose—I think—you see it was a stock company, and I supposed he had some stock in it when he said he had an interest in it; whether he meant, when he said so, that he had a manufacturing, as you say, or a stock, that I cannot tell you.

Cross-Q. 49. In your answer to the thirteenth interrogatory, you said, "I am certain I seen several instruments soon after I moved to New Cumberland," referring to talking-machines; did you see any other talking-machines, about that time, except the three which you have referred to?

A. No other ones, to my recollection, but those laying right before me, here [indicating machines "A," "B," and "F]."

Cross-Q. 50. Did you ever see any talking-machines of his after you saw these?

A. No, sir; not to my recollection.

Cross-Q. 51. You said, if I recollect correctly, that during '71, '72, and '73, you were frequently at Mr. Drawbaugh's shop, but that you have not been there very often since. Did you see these machines, during the years that you went there frequently?

A. I did—those machines. He has a little back office, and I seen them mostly laying on a bench there, and he showed them to me, too. I might have seen other ones, but I don't recollect it certain, whether I did.

Cross-Q. 52. After '73, when you didn't go there so often, did you see these machines?

A. I seen them once in a while, not very often, though.

Cross-Q. 53. In your answer to the 36th interrogatory, which refers, as I understand it, to the years '71, '72, and '73, you used, among other words, this language: "He would always show me and explain to me; but if you mean about working at it, I don't know how to put that in. I suppose he was working at it." "I didn't see him working at it." As he seemed to talk with you frequently about these machines, don't you remember anything more what he said than what you have stated?

A. When I talked about his explaining to me, he would more fully show me the clock and what effect electricity had, and among it then, he would then state that it would carry sound by it, then, but he would not explain. He said he could do most anything with electricity—that is as near as I can get at it. He would not handle these things here, but he would explain that to me. During the time when I moved to New Cumberland, from 1867 till 1870, during that time we talked more about this carrying sound by wires than we did afterwards. After I moved to Shiremanstown we didn't talk so much about it.

Cross-Q. 54. In the 35th interrogatory you were asked what he said about the talking-machine during the years '71, '72, and '73, and your answer was, "He did. He said that he would have it completed." Can you remember more particularly what he said about having it completed?

A. Nothing more than it would answer the same as the telegraph. He didn't say how it would be done, no more than by carrying the sound. He didn't say how it would be operated—not that I recollect. He said it would come much cheaper than the telegraph. That is all I recollect; it is so long.

Cross-Q. 55. What clock did he refer to or explain to you?

A. He had a clock that was going there by wires placed in the ground. I don't know how it is made, but the clock runs, at any rate, without any other thing to move it.

Cross-Q. 56. Did he call it an electric clock, or a magnetic clock?

A. I don't know that—I don't recollect what he called it.

Cross-Q. 57. Did you see the clock at the same times that you saw the talking-machine?

A. At the first, before I moved to New Cumberland, I don't think he had the clock then; I don't believe he had then; it was then that I spoke about the first—if my recollection serves me right—it was altogether on talking through the wires, but here of late, since I went to Shiremanstown, I know he explained about the clock a little more. I don't know whether I seen the clock first when I seen the talking-machines, but I did afterwards, I believe, at the same time that I saw the talking-machines.

Cross-Q. 58. Do you recollect how early it was when you first saw the clock?

A. I don't recollect exactly; I think the first I seen the clock operate was about 1870.

Cross-Q. 59. Did you ever see more than one clock of that kind at his place?

A. I don't believe I did; I don't think I did.

Cross-Q. 60. Do you remember whether he said anything about getting a patent on the clock, or what he expected to do with it?

[*Objected to by Mr. Hill, as irrelevant and immaterial.*]

A. I think he said that he would try for a patent, or something of that sort; I think he said so.

Cross-Q. 61. Did he say anything about manufacturing and selling the clocks?

[*Same objection, so far as the question relates to anything then in the future.*]

A. I don't think he did.

Cross-Q. 62. Were you at Mr. Drawbaugh's place, more or less, during the years '77, '78, and '79?

A. I was there several times—not often.

Cross-Q. 63. Did you see any clocks when you were there at those times?

A. I don't mind of seeing any.

Cross-Q. 64. Do you remember seeing any talking-machines during those visits?

A. No, sir.

Cross-Q. 65. Do you remember any business that was carried on at Mr. Drawbaugh's shop after you removed to Shiremanstown?

A. I do. They were making faucets and spindles. Captain Moore and a company were making spindles for carriages and vehicles. That is principally all that I recollect; I didn't get down there very often.

Cross-Q. 66. In what years was the faucet business carried on, and who was connected with it?

A. I think about '74 and '75 that Houck and his company carried on the faucet business there, and soon after Captain Moore and others had the spindles.

Cross-Q. 67. How long do you think the spindle business was carried on there?

A. I don't think more than about a year.

Cross-Q. 68. After that business was stopped, was any other business carried on?

A. I don't know of any others, except a year or two ago a company started making faucets again.

Cross-Q. 69. Who was in that company?

A. I don't know anything more than I am told that a man named Mr. Chellis is the principal man.

Cross-Q. 70. Do you understand that this last faucet is one which Mr. Drawbaugh invented?

A. I understood so.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 26th day of April, A. D. 1881.
FRED. M. OTT,
Examiner.

C. EBERLY.

Adjourned for dinner.

April 26, 1881, 2.20, P. M.

Examination resumed, pursuant to adjournment.

Present same counsel.

JOHN M. WAGGONER, *being produced, affirmed, and examined, saith, in answer to interrogatories, as follows:*

Examination by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I was fifty-seven years, January 29th; I live in Carlisle, Cumberland county; my occupation is electrician, and has been for some years.

Q. 2. What do you do with electricity in your profession?

A. Cure diseases with it.

Q. 3. Are you also engaged in store-keeping or any other business?

A. Yes, sir; I have a small grocery, that I am back and forward in, when I am not otherwise engaged, running electricity, or operating with electricity.

Q. 4. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county. If so, how long have you known him?

A. I know him, and I have known him for twenty-five years.

Q. 5. Did you ever see any talking-machines at his shop at Eberly's Mills, Cumberland county? If so, when did you first see them?

A. I did in 1874, the week after election—fall election.

Q. 6. How do you fix the year 1874 as the year?

A. Because I was peddling horse and cattle-powder, essences, and drugs the fall of that year, and no other fall before or since.

Q. 7. How did you happen to go to Drawbaugh's shop, that fall, the week after the election?

A. To get one of my batteries repaired; I took one of them there to get it repaired.

Q. 8. How do you fix the time as the week after the election?

A. Because the week of the election, I was driving through the upper end of Cumberland county; I started after I voted on Tuesday. The other reason is that that same week my wife and youngest son went to Perry county, on a visit to see our friends; all these things I remember.

Q. 9. Can you identify any of the talking-machines you saw at Mr. Drawbaugh's shop the week after election?

A. Here they are [pointing to machines marked "B," "F," and "A."]

Q. 10. Did Mr. Drawbaugh talk through them, or did you hear them talked through?

A. He did not talk through them, nor I did not hear them talked through.

Q. 11. In what room did you see those machines?

A. In his private room where he experimented, in the shop.

Q. 12. Were the machines lying exposed to sight when you went into the room, or did he expose them while you were there?

A. He took them out of a cupboard and showed them to me.

Q. 13. Did you see any electric clock or clocks while you were there?

A. I saw one; at that time I saw but the one.

Q. 14. Did you ever see any electric clocks afterwards?

A. I saw the same one afterwards, and I saw others there, too.

Q. 15. Did he ever show you the talking-machines afterwards?

A. No, sir; never.

Q. 16. Where were the electric clocks when you saw them—in a cupboard or on the wall?

A. They were in his private room in the shop. One was attached to the wall, the other was in a case standing up against the wall.

Q. 17. The same room in which the talking-machines were kept in the cupboard?

A. Yes, sir.

Q. 18. Do you remember making any remark to him about the clock at that visit in 1874? If so, what was it?

A. I didn't make any remark about the clock, but about the talking machine.

Q. 19. What were the face and hands of the clock which you then saw there made of?

A. Wood.

Q. 20. What was the remark you made to him about the talking-machines at that time?

A. I told him that they looked very much like a boy's play-things.

Q. 21. What did he say to that?

A. He said that he had got it to perfection; that he was sure it would work, and that he was going to get it patented. He further said that it would do away with a great deal of telegraphing, and that there

Cross-Q. 38. Did you understand him to mean that the things were complete and in condition to work as they then were?

A. Yes, sir; that is what he said, when they are put together; he says "when they are put together; I am sure they will work," and that he was going to get out a patent for it.

Cross-Q. 39. Did you understand that he was going to get out a patent right away?

A. He did not positively say. He just said he was going to get out a patent for it. I supposed from his talk that he was going to do it before a great while, although he did not say so. He specified no time.

Cross-Q. 40. How soon after that were you at his shop again?

A. I was not there at his shop, after that, not for some four months, and then I remained but a few minutes.

Cross-Q. 41. How long did you remain at the time you saw the talking-machine?

A. I was there about one hour, in all, at that time. I will add that, at that time, I went there on other business. I went there to get a battery repaired.

Cross-Q. 42. What else did you talk about while you were there?

A. We talked about the repairing of the battery, and he told me he would fix it in a different shape from what it had been; that is, the part that was worn out. And he showed me how he would fix it, and that took a good part of the hour.

Cross-Q. 43. How often did you visit him during the next two or three years?

A. I was there on Thanksgiving day, 1875, getting a battery repaired, and I was there in March, 1877, getting a battery repaired, and not since; and during all that time there was nothing said about the telephone, or talking-machine, as he called it.

Cross-Q. 44. Did you see the electric clock at both these other times?

A. I saw the electric clocks at both the other times, but there was nothing said about the clocks or talking-machine.

Cross-Q. 45. What did he say about the clock the first time?

A. He told me it was worked by electricity, and he showed me how. He showed me where he had his battery fixed, as he called it, in the earth.

Cross-Q. 46. Did he say anything about patenting it, or what he thought it was worth?

[*Objected to by Mr. Hill as immaterial and irrelevant.*]

PHONE COMPANY,-1

A. He didn't say anything at all about the clock, whether he was going to have it patented or not. The only thing he talked about having patented was the talking-machine.

Cross-Q. 47. His mind seemed to be full of patenting that machine, did it not?

[*Objected to as incompetent, only his statements being evidence.*]

A. Yes, sir; he talked very much in favor of having it patented, and said that he would have it patented.

Cross-Q. 48. I judge from what you have said, that you are not only relatives, but that you are on quite friendly and confidential terms.

A. We are; anything further than that, he attends to his business and I attend to mine; we don't work for each other's pockets; each man's got to work for himself; we are no way connected in business.

Cross-Q. 49. I suppose you have heard within the last three or four years of the introduction of the telephone into use in various places?

A. I did, sir; I heard it by reading the papers—the Philadelphia *Record* in particular.

Cross-Q. 50. How long ago was it that you first heard of it?

A. Well, within the last two or three years, and particularly last fall. I paid very little attention to it, until last fall, or rather in the winter, perhaps.

Cross-Q. 51. When were you first spoken to about testifying as to these talking-machines that you saw at Drawbaugh's shop?

A. It was last fall, or rather the beginning of winter; I think it was the last part of November, or fore part of December. I don't recollect the date. He was in Carlisle at my house; I don't recollect the date; I know the weather was getting pretty cold, anyhow.

Cross-Q. 52. Did you give him an affidavit about the machines?

A. I did.

Cross-Q. 53. Who was with him at that time?

A. Mr. Jacobs.

Cross-Q. 54. They had the machines with them, had they not?

A. Yes, sir; these machines they had along.

Cross-Q. 55. You had not seen the machines, I suppose, before then, since you saw them at Drawbaugh's shop?

A. No, sir; I saw them in Carlisle last fall; that was the second time, and now, here to-day, is the third time.

Cross-Q. 56. How far is Carlisle from Eberly's Mills?

A. It must be in the neighborhood of eighteen miles; I don't know, but I would suppose it was about that.

Cross-Q. 57. You mentioned two or three times that you were at Drawbaugh's shop after you saw the machines there; were those the only times that you and he met, until he came to your place last fall?

A. At his shop they were. I met him two or three times in Carlisle, but we didn't stop long, and then he went after his business, and I went after mine. He is one of the kind of men who don't hold still long. When he is away from home, he attends to his business, and then goes home.

Re-direct examination by Mr. Hill:

Q. Q. 58. At the time you made the affidavit for Mr. Jacobs and Mr. Drawbaugh, before what justice or notary was the affidavit made?

A. Mr. A. L. Sponsler, Esq., of Carlisle.

Q. Q. 59. When they took the affidavit, did they show you the machines first, and then ask you about them, or did they first get your statement of facts, and then show you the machines to see whether you could identify them?

A. They showed me the machines first, and asked me whether I had ever seen the like before, or not. I told them that I had, and that it was his talking-machine that he had showed me in 1874. He asked whether I could be qualified to that fact. I told him that I could. He then took my affidavit.

Q. Q. 60. Do you know whether that was on the sixth day of last December?

A. I could not swear to that; I know that it was either the last part of November, or the fore part of December. I know that it was pretty cold; overcoats were pretty comfortable. I am satisfied from a memorandum now shown me by Mr. Hill that it was the sixth day of December, 1880.

Examination taken, reduced to writing, and by the witness subscribed and affirmed to, April 26, 1881.

FRED. M. OTT,
Examiner.

JOHN M. WAGGONER.

Adjourned until 9.30, A. M., 27th inst.

EPHONE COMPANY,-1

April 27, 1881, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Smith for complainants and Mr. Hill and Mr. Jacobs for respondents.

MICHAEL KONN, *being produced, sworn, and examined, saith:*

Examination by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Fifty-two; York county, Fairview township, is my residence; occupation, a laborer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county? If so, how long have you known him?

A. I have known him for twenty-five years.

Q. 3. Do you know John M. Waggoner, who now lives in Carlisle, Cumberland county?

A. I didn't know him when I seen him there, but they said afterwards that it was him.

Q. 4. Saw him where?

A. At Mr. Drawbaugh's machine-shop. He was in there and I came in.

Q. 5. When was that?

A. In 1874.

Q. 6. At what time in 1874?

A. I couldn't recollect exactly the time—it was about the election.

Q. 7. In the fall?

A. Yes, sir; it was in the fall.

Q. 8. How do you know that it was in the year 1874?

A. It was in the year I moved to Milltown.

Q. 9. When did you move to Milltown?

A. The last Thursday in March, 1874.

Q. 10. Now, do you mean that in the following fall you were in Mr. Drawbaugh's shop, and saw a man there, and afterwards were informed that that man was Mr. Waggoner?

A. Yes, sir.

Q. 11. How soon afterwards were you informed that that man was Mr. Waggoner?

A. I was told that day that that man was Mr. Waggoner.

Q. 12. Was Mr. Waggoner in the shop with Mr. Drawbaugh when you went there that day?

A. Yes, sir.

Q. 13. Who went away from the shop first, you or Mr. Waggoner?

A. I did; I went away first.

Q. 14. Then you found Mr. Waggoner with Mr. Drawbaugh, and you left him there with Mr. Drawbaugh; is that the fact?

A. Yes, sir.

Q. 15. Did you stay there long enough to find out what Mr. Waggoner was there for? If so, what was it?

A. He was there on a shocking-machine Mr. Drawbaugh was repairing and fixing for him.

Q. 16. Do you mean a machine for giving electric shocks to people?

A. It's more than I can tell you about that. It was a shocking-machine that he was fixing and repairing for him.

Q. 17. While you were there with Mr. Drawbaugh and Mr. Waggoner at that time, did you see Mr. Drawbaugh showing any other machine and explaining it to Mr. Waggoner? If so, what was it?

A. He was showing this electricity machine, [indicating machine marked "A."]

Q. 18. Do you distinctly remember this machine marked "A" as being the machine that was there at that time?

A. Yes, sir.

Q. 19. State whether you ever saw Mr. Waggoner in Mr. Drawbaugh's shop at any other time than the one you have referred to.

A. No, sir; I have not.

Q. 20. Do you remember whether you heard anything said between Mr. Drawbaugh and Mr. Waggoner, at that time, as to what this machine marked "A" was for?

A. Not more than I heard them saying it was for electricity.

Cross-examined by Mr. Smith:

Cross-Q. 21. How long were you in Mr. Drawbaugh's shop at that time?

A. I couldn't recollect exactly. I didn't pay any attention to it at the time. No, sir.

Cross-Q. 22. What did you go there for?

A. I didn't go there for any particular business, at all. I just went in there merely and happened to be there.

Cross-Q. 23. Can you describe the shocking-machine which they had there?

A. No, sir; I didn't see the shocking-machine. They were talking about it, but I didn't see it.

Cross-Q. 24. How long did you hear them talking about the shocking-machine?

A. Oh, well, I don't know how long. I just heard them talking a few minutes about it. That was all I heard them.

Cross-Q. 25. How long after you went away was it that Mr. Drawbaugh told you that was Mr. Waggoner?

A. He called him Mr. Waggoner while I was there, you see. I didn't know who the man was at first, until he called him Mr. Waggoner.

Cross-Q. 26. How often did you go to Mr. Drawbaugh's shop after you went to Eberly's Mills to live?

A. That would be hard for me to tell. I could not tell such a thing as that, as I didn't keep account.

Cross-Q. 27. How long did you live at Eberly's Mills?

A. Four years.

Cross-Q. 28. During the remainder of the four years after this visit, did you go into his shop from time to time?

A. Oh, yes; I have been in different times; afterwards I went in.

Cross-Q. 29. But you can't give me any idea how many times, can you?

A. No, sir; I couldn't tell. I never kept an account.

Cross-Q. 30. Can you tell what business you saw carried on there in '75, '76, and '77, down to the time you left?

A. No, I couldn't tell you; there was a good many businesses; a great many articles were made there.

Cross-Q. 31. Can't you tell me what some of them were?

A. He worked at this telephone business, and he worked at clocks.

Cross-Q. 32. In what years did you see him working at clocks?

A. About '76; he was working at it then; I think so; I don't recollect; I didn't keep account of it; he was working at the clock, still.

Cross-Q. 33. Do you remember how many clocks you saw there at any time?

A. Indeed, I couldn't tell exactly. I suppose, maybe, two, or three, or something like that.

Cross-Q. 34. Was he working at the telephone business at the same time he was at work on the clocks?

A. That is more than I can tell you. I heard him talking about it—working at it; I don't know, I didn't see it.

Cross-Q. 35. What did you hear him say about it?

A. I didn't hear him say anything more, than he said he was working at it.

Cross-Q. 36. Did you hear him say that more than once?

A. No, I don't know as I did. I heard other ones talk about it.

Cross-Q. 37. What other persons did you hear talk about it?

A. I heard different ones, I don't recollect who they were; I often heard them say Dan was working at it; that is about all.

Cross-Q. 38. Is that all that you heard them say?

Q. Yes, sir.

Cross-Q. 39. Did you ever see Mr. Waggoner after that time?

A. No, sir; I never did.

Cross-Q. 40. When were you first spoken to about giving testimony in relation to that visit to the shop?

A. The 26th of February, I think it was; the 26th or 25th, I won't say which it was; it was one of the two.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me this 27th day of April, 1881.
FRED. M. OTT,
Examiner.

MICHAEL KONN.

GEORGE FREESE, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I was sixty-two the sixth of March—going on sixty-three; I live in Shiremanstown; I had been Burgess of that place; I am, by occupation, a tailor.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county?

A. Yes, I do.

Q. 3. How long have you known him?

A. I have known him from a boy yet.

Q. 4. Do you recollect making a coat for Mr. Drawbaugh, the price of which was two dollars and a half?

A. I do.

Q. 5. Do you remember about when it was that you made that coat?

A. In my estimation, it was about between eleven and twelve years ago.

Q. 6. Do you recollect Mr. Drawbaugh's paying you for that coat, and how he got the money?

A. Yes, I do; I went to his shop and I asked him how it would suit him to pay that small bill. I then told him I was after that $2 50; that this was the third time I had came after that money; then I told him, "Dan, it seems to me you are pretty hard run." He then had, I think, this very identical thing here [indicating machine "B."] He tried to draw my attention to this machine, and my attention was after the two dollars and a half. He plead poverty; he told me that I should go—I don't know the length of the end of the shop—and he talked through a concern something like this, and I was at the far end of it. This instrument that he had I thought was so insignificant in my estimation I thought it was hardly anything. Says he, "George, if I have this thing accomplished;" then he was working, and had kind of a wire stretched along from this arrangement here to where I was. I think he had something else there that I was to listen to. I then told him this, I still had in my mind that he was drawing my attention to this kind of foolery. I was after the two dollars and a half—didn't care about his infernal machine. I then said, "Dan, if you don't make a fool of yourself as you did about the faucet." Says he, "George, my fortune lies in this, but I am too poor," says he, "unless I have friends that will stick to me." I then asked him—I then told him, "If I had the head you have, and had the article as you say you've got here, and was as confident as you are what this would be—it would be a great thing; this will beat the telegraph." "Oh," says he, "it is not on the same principle as the telegraph; it is better than the telegraph, it works by electricity," I think he said. I didn't pay attention; it was the two dollars and a half I was after; I didn't care nor understand about his machine. After he showed me this machine, this instrument, [indicating "B,"] or something like it—he is right behind me now—says I, "Dan, I am after the two dollars and a half." Says he, "You must be damned hard run." "Not so very, Dan," says I. Says he, "If you are so very hard run I will get it for you." "All right," says I, "that is business on the first floor." "Then," he says, "come along, and I will get the money for you," and we went to Yetter's hotel. There he borrowed the two dollars and a half and gave it to me.

Q. 7. From whom did he borrow the two dollars and a half?

A. From Mr. Yetter, there.

Q. 8. Mr. Henry Yetter, who is now present?

A. That is the gentleman he got it from.

Q. 9. Did Mr. Drawbaugh talk through the machine to you while you were in the shop?

A. Yes.

Q. 10. Were you in the same end of the shop with Drawbaugh when he was talking through the machine, or were you in one end and he in the other?

A. He was at one end and I was at the other.

Q. 11. Did you put your ear to the machine and hear what he said through it?

A. Not close to the machine—just on the outside of the machine, merely. I heard what he said through it distinctly, as though he was alongside of me, when he spoke that at the other end.

Q. 12. Was that the first time you had heard of his talking-machine, or had you heard of it before?

A. Yes, sir, the first time; hold up—I think that he talked about that machine six months before that, but that is the first time that I discovered it rightly.

Cross-examined by Mr. Smith:

Cross-Q. 13. Did you give a deposition, or affidavit, some time ago, with respect to this interview with Drawbaugh? If so, how long ago, and who was present?

A. I can't exactly tell the time—a month or two ago; it might be longer, too. 'Squire Bowman, and Drawbaugh, and a lawyer that they have here—Jacobs—were the three men.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, April 27, 1881.

FRED. M. OTT,
Examiner.

GEORGE FREESE.

EPHONE COMPANY,-1

HENRY YETTER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is all but sixty-three; will be sixty-three years old by the twenty-second of November next; residence, East Pennsboro' township, Cumberland county; occupation, at the present time, a farmer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county? If so, how long have you known him?

A. Yes, sir; I know him some twelve years.

Q. 3. Did you at one time live at Eberly's Mills? If so, when did you commence to live there, and how long did you live there?

A. I moved there, I am not positive whether it was the second or third of April, 1869, and lived there 'till March, 1870, not quite a year, when I moved out of it.

Q. 4. While you lived there, did you keep a store or tavern, or both?

A. I kept a tavern there, and also carried on butchering at the same time.

Q. 5. Have you heard the testimony given here this morning by Mr. George Freese?

A. Yes, sir.

Q. 6. State whether you have any recollection of the circumstance mentioned by Mr. Freese in his testimony, of Daniel Drawbaugh's borrowing two dollars and a half from you.

A. Yes, sir; I have. September the 17th, 1869, I loaned Dan Drawbaugh two dollars and fifty cents to pay Mr. Freese.

Q. 7. Did you understand at the time what it was to pay Mr. Freese for?

A. Yes, sir; the same time Mr. Freese told me it was for a tailor bill.

Q. 8. Did you make an entry of it on your account-books at the time?

A. Yes, sir; I did; I charged Mr. Drawbaugh with two dollars and fifty cents in cash. I have the account with me.

Q. 9. Will you please produce your account-books, and point out the charge, so that the examiner may copy it upon the record?

A. Yes, sir. This was a pass-book in which I made my first entries, and from this posted on to the ledger. This is the item:

1869.
Sept. 17, Daniel Drawbaugh, Dr.
To cash, $2.50.

This is the ledger:

Daniel Drawbaugh, Dr. to H. Yetter.
Sept. 17, To cash, $2.50.

[The date at the top of page is 1869.]

[*The examiner certifies that the above entries are correctly copied from the two books produced.*]

Q. 10. Did you have a running account with Mr. Drawbaugh during the time you were in business at Eberly's Mills, for meats and similar articles furnished by you to his family?

A. Yes, sir; I have; from April 13 to very shortly before I left, in March, 1870.

Q. 11. What were Mr. Drawbaugh's financial circumstances during that time?

A. Poor; very poor. He hardly had any money. What little money he earned he had to take to buy materials for something else he was working at.

Q. 12. Was he able to pay up his account while you lived there, or did it remain open until long afterward?

A. He wasn't able to pay his account during the time I lived there. I suppose about in March his bill was running on pretty heavy, and he done some work for his brother, making some very heavy cider-press screws. His brother was a distiller and his brother wanted Dan to take a barrel of apple-jack whiskey. It wasn't a very prime article. He took it in payment of the screws, providing he could sell it to me. Dan and his brother came to see me, whether I wouldn't take the barrel of whiskey. Dan stated to me that he would owe me a pretty heavy bill, that he was not able to pay me, that his brother would give him some time to wait for the balance that he (Dan) would owe him. So I came to the conclusion that I would better take the whiskey and sell some by the gallon at cost than run the risk of not getting anything.

Q. 13. Did that barrel of whiskey offset the whole of the account, or was there a balance still remaining against Mr. Drawbaugh?

A. There was still a balance remaining against Mr. Drawbaugh. It didn't cover the amount he owed me.

Q. 14. Are these account books which you have produced here in your handwriting?

A. Yes, sir.

Q. 15. And have been in your possession from that time to this?

A. Yes, sir; under a lock, too.

Q. 16. Do you know what Mr. Drawbaugh's character was for sobriety and industry?

A. Mr. Drawbaugh's character was a good character. He was industrious and perfectly honest, but poor. He would willingly pay every man he owed, if he would have the means. Always perfectly sober. I don't know that I ever seen him drink a drink of whiskey. Chance times he would take a glass of beer, but not unless somebody bought it for him. Did not, to my recollection, spend a cent at my bar while I lived there.

Q. 17. State whether you had any knowledge, at the time that you lived there, of Mr. Drawbaugh having a talking-machine. If so, what do you know about it?

A. I was in his shop pretty frequently; I have seen one part of it. I came down one day in hay-making or harvest, and I says: "Dan, what are you working at?" And he said: "Making a talking-machine." And I seen this part here [witness takes in his hand machine marked "F,"] this is the only part I remember. I had no belief in it—talking through an old broken tumbler. He might have told me more if I had any belief in it. This part here [pointing to the side of the mouth-piece of the tumbler "F"] wasn't off at that time.

Q. 18. You mean that the mouth-piece was unbroken and round?

A. Yes, sir; the same as the other piece there.

Q. 19. Did you ever see it at any other time?

A. I seen it two or three times on the bench that he was working at it to experiment.

Q. 19½. Do you mean while you still lived at Eberly's Mills?

A. While I lived there; yes, sir.

Q. 20. Did he explain the talking-machine to you?

A. Not that I remember of.

Q. 21. Did he tell you how it was to be operated, whether by electricity or otherwise?

A. He was talking something that he would operate it by electricity, but being such an unbeliever in it, I kind of laughed at it. I hardly knew what electricity meant at that time, or what it was used for.

Cross-examination by Mr. Smith:

Cross-Q. 22. What was the whole amount of your bill against Drawbaugh while you lived there?

A. It was a little over a hundred and sixteen dollars; some odd cents over.

Cross-Q. 23. What was the price of the barrel of whiskey, and when was the balance paid?

A. The balance wasn't paid. The price was to be two dollars a gallon. The whiskey had been made out of pomace. After the cider had been pressed out, they took and distilled the pomace; so the whiskey wasn't proof. It might have been higher if it had been proof. It was two dollars a gallon.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 27th day of April, 1881.
FRED. M. OTT,
Examiner.

HENRY YETTER.

Adjourned until 2.15, P. M.

April 27, 2.15, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

DANIEL B. CONDRY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am a miller by trade; thirty-one years of age next August; I reside at Eberly's Mills, Cumberland county.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county? If so, how long have you known him?

A. I have known him since May, 1874.

Q. 3. How long have you resided at Eberly's Mills?

A. I moved to Etter and Shanklin's mill, one quarter of a mile south of Eberly's Mills, September 9, 1875, and have resided there ever since.

EPHONE COMPANY,-1

Q. 4. Were you in Mr. Drawbaugh's shop soon after you moved to that neighborhood?

A. Yes, sir; I was in in the fall of 1875.

Q. 5. Do you remember what you were doing on Christmas day, 1875?

A. Yes, sir; Winfield Gross and I went up to Drawbaugh's shop.

Q. 6. Did you see any talking-machines there on that day?

A. I saw what he termed talking-machines.

Q. 7. Was that the first time you had seen them, or had you seen them before that?

A. That was the first time that I can remember.

Q. 8. Please look at machines now shown you, marked "A," "B," "C," "D," "E," "F," "G," "I," "K," "L," "M," "N," and a machine which I now mark "O," and state if you recognize any of them as machines that you saw on Christmas day, 1875, at Mr. Drawbaugh's shop. If so, point out to the examiner which ones you then saw.

A. This one I can remember very well at the time, [pointing to machine marked "B."] Those two also [pointing to machine marked "D" and "E."] This one also [pointing to machine marked "F."] I saw this one at that time or shortly after [taking up "A"] I can't tell whether it was on that day or not.

Q. 9. Was Mr. Drawbaugh there that day?

A. Yes, sir.

Q. 10. Did he explain how the machines were operated?

A. He said that he had used them to talk through.

Q. 11. Did he say whether they were operated by electricity or not?

A. I most think he did; I ain't positive about it.

Q. 12. Did you hear anybody talk through them that day?

A. No, sir.

Q. 13. Where were the instruments when you saw them that day—in what part of the shop?

A. On the second floor, in the back room facing Yellow Breeches creek.

Q. 14. Did he say anything at that time about the machine taking the place of telegraphing?

A. Not as I can remember.

Q. 15. Between Christmas, 1875, and July, 1880, were you, from time to time, in Mr. Drawbaugh's shop?

A. Yes, sir.

Q. 16. As you would go in there from time to time, during those years, would he continue to show you talking-machines, or not?

A. He didn't show them to me just every time I came in; but two or three times at least, anyhow.

Q. 17. The same old machines, or new and different ones?

A. He showed me different ones and improved ones.

Q. 18. Please look at these machines, marked "G," "K," "L," "M," "N," "O," and state whether you recognize any of them, as among the improved machines which you saw after Christmas, 1875, at his shop.

A. I hardly know which they were; they were among these; I can't hardly tell which ones; those are some of them he called improvements.

Q. 19. Can you pick out any of these six machines last shown you and identify them as being the same, or the same in appearance, as improved machines which he showed you there after Christmas day, 1875?

A. I couldn't pick them out, but they are the same in appearance.

Q. 20. You mean they are all six the same in appearance as machines which you saw there during that time?

[*Objected to by Mr. Smith as leading.*]

A. I can't say that I saw the whole six, but some of them, at least, and they are the same in appearance with what I did see; but how many of them I don't know.

Q. 21. During that time, from 1875 to 1880, did he or did he not show you other talking-machines that are not on the table?

A. I can't say whether they are on the table or not. He showed me other talking-machines; whether these are the same ones or not I can't say.

Q. 22. Did he talk to you through any of them?

A. Yes, sir.

Q. 23. In what part of the shop were you, and in what part was he, when he talked to you through the machines?

A. I was on the lower floor, or ground floor, and he was on the second floor, next above where I was.

Q. 24. You were on the first floor from the ground, were you?

A. Yes, sir.

Q. 25. Could you hear, and understand distinctly, what he said when he talked through the machine to you?

A. Yes, sir.

Q. 26. Do you remember whether the machines were connected by wires, when he was talking to you?

A. Yes, sir: by wire.

Q. 27. Do you remember whether it was one of these machines, "A," "B," "D," "E," "F," that you heard him talking through, or whether it was one of these later machines, "G," "K," "L," "M," "N," "O," or machines like these later machines?

A. They were machines that had the appearance of these machines, [pointing to "G," "O," and "L,"] something on that order. It was not one of the machines "A," "B," "D," "E," "F."

Q. 28. To the best of your recollection, how long after Christmas, 1875, was it when he talked to you through these machines, as you have testified?

A. I could not say. Probably one or two years afterwards.

Q. 29. Did you see the wire or wires that were stretched out along the creek at one time to a stump

A. Yes, sir.

Q. 30. Did you talk through the machine when it was connected to those wires along the creek?

A. No, sir.

Q. 31. Did you ever talk through the machine except that once, of which you have testified?

A. Not as I can remember. I don't think I have.

Q. 32. When Mr. Drawbaugh first showed you these two machines, ("D" and "E,") on Christmas day, 1875, did he show you how they were to be used—how they were to be placed to the mouth or ear?

A. Yes, sir.

Q. 33. From Christmas day, 1875, to July, 1880, about how many times a year were you in Mr. Drawbaugh's shop, to the best of your recollection?

A. I can hardly tell. I went up there several times on business; different times to get a spindle turned up; several times to get a red staff straightened up and trued, and other jobs I had up there with Mr. Drawbaugh.

Q. 34. From all you saw and heard at Mr. Drawbaugh's shop, during your several visits there, from 1875 to 1880, what would you say as to his continuing his talking-machine business right along from 1875 to 1880?

A. To the best of my knowledge, and from what I have heard, he was working at it all the time; that is, not just all the time, but improving it.

Q. 35. State, if you know, what his financial condition was during all that time.

A. It wasn't just so good. People all counted him pretty slow pay. In fact, one time I was ordered not to trust him at the mill—and I think that is bad enough—for any flour or feed.

Q. 36. Do you know what his general reputation was in the community there, for honesty, temperance, and industry?

A. Good; I never heard anything about his honesty or dishonesty; never knew him to be intemperate; he was always industrious; people counted him a genius; said he worked hard.

Q. 37. Was Winfield Gross ever in Mr. Drawbaugh's shop with you more than that once?

A. Not as I can remember; he might have been.

Cross-examined by Mr. Smith:

Cross-Q. 38. What work or business was carried on at that shop after 1875?

A. As far as I know, there was working at some kind of electric clock one time; next time faucets. I hardly know what, but them two articles I know he was working on—clocks and faucets.

Cross-Q. 39. Were there any clocks there when you went there on Christmas, 1875?

A. I think there was. I ain't positive, but feel sure there was.

Cross-Q. 40. How many?

A. I hardly know how many there were at that time, but I saw as many as two or three, different times, when I was there.

Cross-Q. 41. Do you know whether anybody was interested with Drawbaugh in carrying on the faucet business at that time, after 1875?

A. I hardly know whether there was the first time I saw it, but later there is.

Cross-Q. 42. When did you first see the faucet business going on?

A. I saw it different times when I was there, between 1875 and the present day. I couldn't state when I first saw it.

PHONE COMPANY,-1

Cross-Q. 43. Whom did you understand to be interested with him in that business?

A. Mr. Chellis—Edgar W. Chellis.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to this 27th day of April, 1881.
FRED. M. OTT,
Examiner.

D. B. CONDRY.

Adjourned until April 28, at 10 o'clock, A. M.

April 28, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow and Mr. Smith for complainants, and Mr. Hill and Mr. Jacobs for respondents.

JEREMIAH FRY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is forty-seven; residence, Shiremanstown, Cumberland county, Pennsylvania; I have been farming tobacco during the last year; I kept store for several years before the last year.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania?

A. Yes, sir.

Q. 3. How long have you known him?

A. I knowed him before I moved there. In 1875, I moved there, and then I knowed him; knew him by sight before that time. Since 1875, I had dealings with him.

Q. 4. Did you move to Eberly's Mills in 1875? If so, what was the time of year when you moved there?

A. I did; the last of March—towards the last of March.

Q. 5. How long did you live there after moving there in March, 1875?

A. Five years.

Q. 6. A young man named Jacob B. Fry has testified as a witness in this case; is he your son?

A. Yes, sir.

Q. 7. After you moved to Eberly's Mills, did you ever see any talking-machines in Mr. Drawbaugh's shop there? If so, how soon after you moved there?

A. About the ninth day of April, 1875, I saw talking-machines in his shop.

Q. 8. What makes you fix the date as about the ninth of April, 1875?

A. He was talking for some potatoes, and I went down that day and I sold him some.

Q. 9. Did you make a memorandum of the sale of the potatoes at that time?

A. Yes, sir.

Q. 10. Have you looked at that memorandum to verify the date?

A. Yes, sir.

Q. 11. When did you look at it?

A. This morning I looked before I left home; I also looked some time ago.

Q. 12. Do you remember how many talking-machines you saw at his shop, on or about the ninth day of April, 1875?

A. One; that was a glass tumbler, tin box, and a couple of other pieces.

Q. 13. Please look at the instruments now shown you, marked "A," "B," "C," "D," "E," "F," "G," "H," "I," "J," "K," "L," "M," "N," "O," and see if any of them are the machines which you saw there at the time you sold the potatoes to him; and if so, please point out the machines which you saw to the examiner.

A. This here [indicating "B"] Mr. Drawbaugh showed me first; the tumbler also [marked "F"]. He showed me these here [pointing to "D," "E," and "A."]

Q 14. Did he talk through any of the machines to you at that time?

A. He sang.

Q. 15. Could you hear him through the machine when he sang into it?

A. Yes, sir.

Q. 16. Did he tell you at that time what the machine was for? If so, what did he say?

A. Talking-machine.

PHONE COMPANY,-1

Q. 17. Did he tell you whether it worked by electricity, or not?

A. I don't mind that any more.

Q. 18. Did you ask him, or did he tell you, how far he could talk through the machine? From one floor to another?

A. I asked him how far he can talk; as far as the wire goes, he said.

Q. 19. Do you remember and can you point out the machines which he talked into, and which you listened at, when you heard him sing?

A. I can't just say which one; it was one of these here, or one like them [indicating "D" and "E"]. I can't tell exactly which one it was.

Q. 20. Do you mean that you can't tell exactly which of the two it was?

A. Yes, sir; it was one like one of these here; I can't tell just which one I did see [pointing to the instruments "D" and "E"].

Q. 21. From that time to the time when you moved away from there, in 1880, were you in his shop, from time to time every year, or not?

A. Yes, sir.

Q. 22. As near as you can remember, about how often were you in there each year?

A. About ten or twelve times.

Q. 23. During the first year, after you saw the machines in 1875—I mean during the year 1876—did you see any talking-machines there that you had not seen before?

A. Yes, sir.

Q. 24. How about the second year, 1877? Is it your recollection that you saw any talking-machines there that year that you had not seen before?

A. Yes, sir.

Q. 25. Answer the same question as to 1878.

A. Yes, sir.

Q. 26. How about the next year, 1879? Answer the same question as to that year.

A. Yes, sir.

Q. 27. Can you point out any of the machines on the table that you saw there in 1876, 1877, or 1878 that you had not seen before?

A. I don't know whether I can, just. I seen one of these here; I can't tell you which one it was, and I seen the improvements on it. I know it was different from the first. I can't point out which one I seen every year, but I seen improvements on it every year.

Q. 28. Do you recollect at any time seeing this machine [handing the witness machine "C"] there?

A. Yes, sir.

Q. 29. Was that the first time that you saw the machines or afterwards?

A. The first I saw the machines, I saw it standing there.

Q. 30. Do you recollect at any time seeing these two machines, [indicating machines "H" and "I,"] or either of them?

A. Yes, sir.

Q. 31. Did you ever talk through any of the machines after April, 1875, to your best recollection?

A. Yes, sir.

Q. 32. A good many times or not?

A. Only once, that I remember.

Q. 33. About when was that, to the best of your recollection?

A. In the spring of 1880.

Q. 34. Do you see the machine here through which you talked, in the spring of 1880? If so, please point it out.

A. These here machines [pointing to "H" and "I"].

Q. 35. Did you keep store at one time at Eberly's Mills? If so, when did you begin, and how long did you continue?

A. I began in 1875, first of October; continued till 1878, in the spring; sold off, and didn't keep no store in 1878—from that spring on until the next spring; from 1879 to 1880 I kept store again.

Q. 36. State whether or not Mr. Drawbaugh was in the habit of purchasing in your store, during the time you traded there, articles for his family use?

A. Yes, sir.

Q. 37. All along during the time you traded?

A. Yes, sir.

Q. 38. What was his condition as to ready money to pay for those articles?

A. He always complained that he was scarce of money.

Cross-examined by Mr. Smith:

Cross-Q. 39. How large was your account against him during the time you kept the store.

A. Somewheres in forty dollars, the largest amount he owed me; I can't exactly tell you the amount; somewhere about that.

Cross-Q. 40. How much do you think he traded in that time?

PHONE COMPANY,-1

A. I can't tell, exactly; maybe a couple of hundred dollars.

Cross-Q. 41. When did you first see the machines marked "H" and "I"?

A. It was in 1879; I can't exactly just tell the time.

Cross-Q. 42. What did Mr. Drawbaugh say about these two when you saw them?

A. That it was a telephone.

Cross-Q. 43. Is that all that he said to you about them?

A. I don't remember anything more.

Cross-Q. 44. Did he say anything to you about them at the time you heard talking in them, in the spring of 1880?

A. Yes, he talked through them to me.

Cross-Q. 45. What I wanted to know was whether he said anything about the machines, whether they were an improvement or not, or anything whatever?

A. I misunderstood the question. He said it was an improvement on the telephone.

Cross-Q. 46. Is that all that you remember?

A. He talked to me through them.

Cross-Q. 47. At the time when he showed you other improvements, did he say anything to you about them?

A. Told me they were telephones; that is, first he called it talking-machines—he first said.

Cross-Q. 48. At the time you first saw the instruments "B" and "F," and "D" and "E," what did he say about them?

A. He said it was talking-machines.

Cross-Q. 49. Was that all he said?

A. I asked him then how far he can talk; then he said, "As far as the wire goes."

Cross-Q. 50. Did he tell you when he made "B" and "F"?

A. I asked him, "When did you get these up?" He said, "Several years already." I don't mind the time he said.

Cross-Q. 51. Did he say anything at that time about improving the instruments?

A. Yes.

Cross-Q. 52. What was it?

A. He said he was improving it—going to improve it.

Cross-Q. 53. Did you see those four machines, or either of them, more than once, during the year 1875?

A. Yes, sir.

Cross-Q. 54. How many times?

A. I am not able to tell how many times.

Cross-Q. 55. Do you recollect what he said about them at any of those times?

A. No, sir; I do not. I saw them lying there, but I do not recollect what he had said at any time about them.

Cross-Q. 56. Do you remember whether you asked him during that year, or any of the following years, how he was getting along with his improvements?

A. Yes, sir.

Cross-Q. 57. What did he say when you asked him that?

A. "Still improving some."

Cross-Q. 58. Do you remember when that was?

A. It was in 1876.

Cross-Q. 59. Did you have any talk with him about improvements in 1877 or 1878?

A. Yes, sir; I came down and asked him, "Still improving your telephone?" "Oh, yes," he said.

Cross-Q. 60. About what time was that?

A. Oh, I can't tell you exactly the time; I came down pretty often.

Cross-Q. 61. Do you mean that you inquired of him pretty often about his improvements?

A. No, sir; I was down about some other business.

Cross-Q. 62. What other business did you go down there about?

A. After some money, sometimes.

Cross-Q. 63. Did you see any other business carried on in the shop during those years?

A. Yes, sir.

Cross-Q. 64. What?

A. His clocks, magnetic clocks, I guess he called them.

Cross-Q. 65. Have you, at any time before this, made an affidavit with respect to these talking-machines?

A. Yes, sir.

Cross-Q. 66. When was that?

A. I can't tell the exact day. It was last summer, or rather in the fall. From a memorandum now shown me by Mr. Hill I am now satisfied that it was the first day of September, 1880.

PHONE COMPANY,-1

Cross-Q. 67. Did you ever, while you lived at Eberly's Mills, talk with other people besides Mr. Drawbaugh about his talking-machines?

A. Yes, I talked with several persons; that it is a very good thing if he gets it accomplished.

Cross-Q. 68. With whom did you talk?

A. With some of the neighbors there and some of my relations.

Cross-Q. 69. Can you give the names of any of the people with whom you talked?

A. I can give some: Daniel Fettrow, William Dellinger, Jacob Swartz, Peter McQuait, Michael Konn, and some of my friends that stopped there at my place, and I talked to them about it.

Cross-Q. 70. Did these people that you talked to about it think it would be a good thing if he got it accomplished?

[*Objected to by Mr. Hill, as immaterial, irrelevant, and incompetent.*]

A. Yes, they all allowed it's a very good thing.

Cross-Q. 71. Do you know whether any of them had seen any of the machines?

A. Yes, my brother-in-law; I had showed them to—took him down there to see them.

Cross-Q. 72. When did you take him down there?

A. Somewheres in 1878.

Cross-Q. 73. What was your object in taking him there?

A. I was going to show him the magnetic clock.

Cross-Q. 74. And did he hear any talking through the talking-machine?

A. No, sir.

Cross-Q. 75. What did he say about them when you showed them to him?

[*Objected to by Mr. Hill, as immaterial and incompetent.*]

A. He said if he could talk through them a distance it was worth a good deal to him. I showed it to him; Mr. Drawbaugh did not show it to him.

Cross-Q. 76. Which of these machines did you show to him?

A. These small ones here—some of these here [indicating "B," "F," "D," "E," and "G," "K," "L," "M," "N," "O," and "A."] They might have been all these on the bench; I don't know whether they were or not.

Cross-Q. 77. What is your brother-in-law's name, and where does he live?

A. He lives in York county; Samuel Mummert is his name, Conewago township.

Cross-Q. 78. Did your neighbors at Eberly's Mills frequently talk about Drawbaugh's talking-machines or telephones?

A. Yes, I heard them talk of it sometimes.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me this 28th day of April, 1881.
FRED. M. OTT,
Examiner.

JEREMIAH FRY.

Adjourned until two o'clock, P. M.

April 28, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow, for complainants, and Mr. Hill and Mr. Jacobs, for respondents.

HENRY BAYLER, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, sixty-two; residence, York, Pennsylvania; at this time, not engaged in anything.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania? If so, how long have you known him?

A. Became acquainted with him in 1873; knew him until 1876; did not hear anything of him, excepting what I seen through the papers, until a few weeks ago.

Q. 3. State how you came to make his acquaintance in 1873.

A. I embarked in the lumber business at New Cumberland with another party. He (Drawbaugh) was called down from Milltown, as it was called then, to do some little repairs to the engine.

Q. 4. Did you ever go up to Milltown, or Eberly's Mills, as it was called, to see him during 1873, '4, '5, or '6?

A. I did, by invitation from him.

Q. 5. Did you have any knowledge of his talking-machine during any of those years? If so, when first and how?

A. As near as I can tell, some time in June, 1873, I went up to Milltown, when he showed me some of his inventions spoken of before. Among others was a very crude machine, and he showed me the workings of it. After showing and explaining it, I remarked: "Why, Dan," as I familiarly called him, "that is virtually a talking telegraph," and advised him to take out a patent. Says he: "If I had the means I would. If you'll advance me the means to procure a patent, I'll give you one half interest."

Q. 6. At the time when he showed it to you on that occasion, did you talk through it or hear anybody talk through it?

A. Yes, sir.

Q. 7. Who was present besides yourself?

A. His brother—I think his name is John.

Q. 8. Was it the one generally known as 'Squire Drawbaugh?

A. I think so; I ain't positive about that.

Q. 9. State where the machine was that he was talking into, and where the one was that you were listening at, during that conversation.

A. The machine was on the table in his work-room, or office, on somewhat of a raised shelf, the wire passing out of that through another room, and into the third one, as it were; when he furnished me with a crude ear-trumpet, made out of stiff paper—heavy paper—and instructed me how to use it, whilst he went to the machine at the other end, and talked to me. I could distinguish his voice, when I remarked to him: "Why Dan, that is the talking telegraph." That is the time I had advised him to take out a patent, which he said he didn't have the means, but would give me a half interest if I furnished them.

Q. 10. Did his brother remain with you, or go with him, when he went to the other end of the shop to talk through the machine?

A. His brother remained in the office, or work-room.

Q. 11. State whether or not you did, by means of the machine, hear and understand distinctly what Mr. Drawbaugh said through it.

A. I can't recall to mind what he did say; I could only plainly distinguish his voice.

Q. 12. What I mean is, did you, at the time, plainly hear and understand what he said, though you may have now forgotten what it was?

A. By being able to distinguish his voice, I would suppose I could have understood what he said. He had been an entire stranger to me previous to the first of April, 1873.

Q. 13. Then you do not now remember whether you understood what he said, except from the fact that you distinguished his voice clearly?

[*Objected to by Mr Storrow, assuming and as leading:*]

A. I do not at this late day, as before said, remember the words.

Q. 14. State whether he talked, or sang, or whispered through the machine.

A. He talked. Afterwards he said he would talk in a very low voice; he did talk in a very low voice.

Q. 15. Did you still hear him, when he talked in a very low voice?

A. Yes, sir.

Q. 16. Did he ever show you the talking-machines afterwards, during the years 1873, '4, '5, or '6?

A. Never been into his place of business after the summer of 1873. He was frequently called to our place at New Cumberland to do some little repairs. Always pressed me to furnish him the means to get a patent.

Q. 17. How long were you connected with the lumber business at New Cumberland?

A. My partnership extended three years, from April, 1873—I think it run late in 1876 before I got out, or maybe it was 1877. I have my data at home.

Q. 18. State whether or not, during your co-partnership and until the business was closed up, Mr. Drawbaugh continued to urge you to furnish him the means for taking out a patent and to take an interest in the invention. What was the fact about that?

A. Generally on him meeting me, he would urge it—urge me to take an interest by furnishing the means to take out a patent. In 1873, on one occasion, I was almost induced to risk a few hundred dollars, and would have done so had my business progressed more satisfactorily. Owing to my partner, unknown to me at the time of accepting him, being considerable of a drinking man, which I knew nothing of at the time of accepting him as a partner, greatly worried me, which was the principle reason why I didn't take out a patent for Drawbaugh.

Q. 19. Do you think you could identify any of the machines that Mr. Drawbaugh showed you if you were to see them again?

A. I *think* I could.

EPHONE COMPANY,-1

Q. 20. Do you know what Mr. Drawbaugh's financial circumstances were during the time that you were engaged in the lumber business at New Cumberland?

A. Only from hearsay, and my own knowledge is, hard to get money from; didn't ever seem to have any. For his repairs that he made for us, he would collect very close, and would want the money for the repairs if he owed us or not.

Q. 21. Did he state why he wanted the money?

A. Sometimes for provisions for his family, at other times he would not state for what purpose. Unless he was in our debt, there were no questions asked.

Q. 22. Do you know what was the common report in the neighborhood where he lived, about the condition of his family, for the necessaries of life?

A. I have heard, at the time I was engaged at New Cumberland, that he was very poor, and often did not have the necessaries.

Q. 23. State in full just what you heard about it at that time.

A. That is about as full as I can state it, excepting that I did hear that they did not know in the evening where their breakfast was to come from next morning.

Q. 24. State whether or not Mr. Drawbaugh, at one time, during your co-partnership, or at sundry times, obtained some lumber from you, and if so, when the account was settled and paid.

A. Frequently he got lumber from us. Account was settled through repairs, excepting the last bill, about the end of my business transactions there, for which I hold a lien against him or somebody else, I don't know which any more. When I left I placed the settlement of everything—the collection—and gave the party a power of attorney to close up and settle the business, and that is about the last that remains open.

Q. 25. Will you now please look at these two instruments, "B" and "F," and state whether you saw them, or either of them, at Mr. Drawbaugh's shop in June, 1873?

A. I think I recognize this as being on the raised platform in his work-room, [indicating machine "B,"] or something similar to it, unless this here [indicating machine "F"] was connected with it; there was a glass tumbler, I recollect.

Q. 26. Do you remember whether he talked into the tumbler or not, or did you see him at any time, while you were there?

A. I did not see him while I was listening; I was in another apartment.

Q. 27. When you put your ear to the paper funnel, or whatever it was, do you remember whether you put the other end of the funnel to the end of the tin box, [marked "B,"] or another similar to it?

A. I do not, sir.

Q. 28. Do you remember the fact of Hauck & Co. buying out, or taking possession of, the faucet business at Mr. Drawbaugh's shop?

A. I remember the fact. I did not know anything about it at the time I was there. I was after the faucet interest, not knowing that there had been a company formed before that, and at my first visit there, I did not know that he had sold, or that they had sold, to a Mechanicsburg party. I was only apprised of that afterwards.

Q. 29. Do you remember how long afterwards?

A. No, I don't know.

Q. 30. State your best recollection, whether it was soon afterwards, or a long time afterwards.

A. It might have been two weeks, and it might have been longer.

[*Mr. Smith left for the East about half an hour ago, and now Mr. Storrow is obliged to absent himself, but it is agreed between counsel that the direct examination of this witness may be proceeded with and closed, and that the witness shall be re-called hereafter for cross-examination. It is also agreed that when the commission adjourns to-night, it shall adjourn till next Tuesday morning, May* 3, *at* 10 *o'clock.*]

Q. 31. Will you please look at the machine marked "C," now shown you, and state whether you recollect seeing that at Mr. Drawbaugh's shop at the time of your visit there, in June, 1873?

A. It strikes me I remember seeing it there. My attention was more particularly attracted to the faucets.

[*Examination of Mr. Bayler suspended.*]

Adjourned until Tuesday, May 3, at 10 o'clock, A. M.

Tuesday, May 3, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Cross-examined by Mr. Storrow:

Cross-Q. 32. How did you happen to go to Drawbaugh's on the occasion you have referred to?

EPHONE COMPANY,-1

A. By invitation from him.

Cross-Q. 33. What did he invite you for?

A. For the purpose of seeing an invention that he had there.

Cross Q. 34. What invention?

A. At the time he didn't make any mention of it, until I got to his place, when he showed me what he said would finally take the place of telegraphing.

Cross-Q. 35. Did you understand that that was the invention that he had invited you to come there to see?

A. After I got there I understood it as such.

Cross-Q. 36. Then you went there simply because he invited you to see some inventions, you didn't know what. Is that so?

A. Didn't know what at the time, but, as he stated, it might be of interest to me.

Cross-Q. 37. When did he give you this invitation?

A. In the spring of 1873. . .

Cross-Q. 38. How long before you went there did he give you the invitation?

A. It may have been a few weeks.

Cross-Q. 39. Please state your best recollection about the time.

A. That is about as near as I can get to it.

Cross-Q. 40. Did he give you the invitation by word of mouth or by letter?

A. By word of mouth.

Cross-Q. 41. Where?

A. At New Cumberland,

Cross-Q. 42. At your mill?

A. At the one we were operating.

Cross-Q. 43. I suppose when he gave you the invitation you asked him what the invention was, didn't you?

A. I don't know that I did; he was an entire stranger to me at the time.

Cross-Q. 44. What is your best recollection as to whether you did or not?

A. My best recollection is that I didn't ask him anything about it. He had been speaking about the faucets. As for the other, I don't think I asked him anything about it.

Cross-Q. 45. Had he been speaking about the other, too?

A. He told me he would show me something that might be to my interest if I came up; and I did so at my leisure, some weeks after.

Cross-Q. 46. And your visit was to see that undescribed thing which you afterwards found was a talking-machine, was it?

A. My visit was to see what he had to show me, not knowing what it would be. He, also, in explaining the talking-machine—or rather, I should have said, after explaining the talking-machine—introduced the faucets which I understood more about than the other, and was favorably impressed with the invention.

Cross-Q. 47. When did you see the instruments, "F," "B," and "C," after that visit?

A. I saw the instruments without being designated by any letters, and don't know them by letters.

[*The instruments are now shown to the witness, and, after inspecting them, he continues his answer.*]

I don't think I seen them again until probably a month ago.

Cross-Q. 48. Are they in the same condition now that they were in when you saw them at his shop?

A. They are not.

Cross-Q. 49. State where the difference is in each.

A. The principles about them are the same. These two ["F" and "B"] were, I think, connected by some means or other; this here [indicating "C"] I am not so positive about.

Cross-Q. 50. If "F" and "B" were in any different condition then from what they are now, please state all the differences.

A. I believe I have said that they were somewhat connected, but I don't remember in what way, as I paid not much attention to the instruments.

Cross-Q. 51. What part of the shop was "F" in?

A. In the office with this here, as it was shown me at the time, [indicating "B."]

Cross-Q. 52. What part of the mill was the office in?

A. Now, there is such a difference of opinion as to the location. My idea of the office was that the building was facing south and the office at the west end.

Cross-Q. 53. Was the office at the end next to the stream?

A. There was a stream in front and rear. The office was at the end of the building which was up stream.

Cross-Q. 54. As you go down the hill, near the mill, coming from Harrisburg, was the office on the side facing you or on the other side?

A. Well, I never came that road, and my visit there was the first visit in that section of country. I approached the place from, I would call it, the north side of the Yellow Breeches, from about a mile down stream, passed around the grist-mill, and down the little peninsula there to the machine-shop. Left the horse and vehicle in the neighborhood of the grist-mill and walked down to the shop.

Re-direct examination by Mr. Hill:

Q. Q. 55. If I understand the latter part of your cross-examination, you wouldn't undertake, with the limited knowledge of the locality that you have, to be sure as to the exact position of the rooms, with reference to the points of the compass, the roads, or the streams? Am I correct in this or not?

A. I wouldn't confine myself positive to the points of the compass. The general course of the stream is eastward, as I understand it. I came there from down stream, consequently passed on westward, on the north side of the Yellow Breeches, and, as before said, passed around the grist-mill and reached the shop, as stated before.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 3d day of May, 1881.
FRED. M. OTT,
Examiner.

HENRY BAYLER.

Tuesday, May 3, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

By consent, the cross-examination of Mr. Bayler was suspended to examine the following witness:

DAVID B. CARL, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. About thirty-nine; Dillsburg, York county, eight miles from

Mechanicsburg, about eleven miles from Eberly's Mills, is where I live. I generally followed butchering. I am assessed as a farmer now.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county; and if so, how long have you known him?

A. I have known him since the year 1868 or 1869.

Q. 3. Did you formerly reside at or near Eberly's Mills? If so, how long, and from what time to what time?

A. I lived there four years; I moved there in the spring of 1869 and left in the spring of 1873.

Q. 4. While you lived there, at Eberly's Mills, did you or not frequently visit Drawbaugh's shop?

A. Yes, sir; I did.

Q. 5. Did you ever, at that time, see there what he called a talking-machine?

A. I did; in about the year '70, I saw it.

Q. 6. Please look at the machine marked "B," now shown to you, and state whether you have ever seen it before, and, if so, when and where you first saw it?

A. Yes, sir; I saw it. I saw it there at his shop—machine-shop there at Eberly's Mills. The first I saw it was in the year '70; I couldn't tell you whether it was the beginning or last of the year, but that year I know I saw it.

Q. 7. In what part of the shop was that instrument when you first saw it?

A. There was two rooms; there is another part that belongs to this here, and I don't remember which part was in either room; they were small rooms; one of them was about half as large as this.

[*Examiner certifies that this room is about* 17 *feet square.*]

Q. 8. Please look at the instrument now shown you, marked "F," and state whether you ever saw it before, and, if so, when and where you first saw it.

A. Yes, sir; I saw it; that is the machine that was attached to this other; I saw it at the same time.

Q. 9. Do you wish to be understood that the instrument "B" was in one room, and the instrument "F" in the other?

A. Yes, sir.

Q. 10. Do you recollect whether the two instruments were connected in any way? If so, by what?

A. They were, by a wire, like this here wire [indicating the wrapped wire on the electro-magnet of machine "B"].

Q. 11. Did you talk, or hear anybody taik, through the machines?

A. No, sir; I didn't; but Mr. Drawbaugh told me that it was calculated to be a talking-machine.

Q. 12. Did he tell you why he used two instruments?

A. Yes, sir; he said the one was to speak into, and the other was to listen at.

Q. 13. Did he, at that time, tell you how it operated?

A. Yes; he said a man could hear at one end just what a man spoke to him at the other end—hear whatever he said.

Q. 14. What, if anything, did he say about the distance to which anybody could hear words through the machine?

A. Said he could hear a man talking from that place to New Cumberland or Harrisburg, and understand distictly what he said.

Q. 15. Did you see the machines more than once while you resided at Eberly's Mills?

A. Yes, sir; I saw them more than once, but I couldn't tell you how often.

Q. 16. Did you ever hear them talked through?

A. No, sir; I never did.

Q. 17. While you were living at Eberly's Mills, what was your business?

A. I followed butchering there.

Q. 18. Did you furnish Mr. Drawbaugh during that time with meats for his family?

A. Yes, sir; I did.

Q. 19. Have you an account with him?

A. Yes, sir.

Q. 20. Have any trouble about getting your pay?

A. Pay was always very slow; I never got any amount from him at one time.

Q. 21. What did you understand at that time to be the cause of his slowness?

A. Well, he never had it; never had the money to pay it.

Cross-examined by Mr. Storrow:

Cross-Q. 22. Please fix, as near as you can, the time when you first saw these instruments "F" and "B."

A. As I said before, it was in the year '70; I can't tell you the time;

I think it was in the summer season; I am pretty sure it was. I first come to see it when I was hauling some stuff back and forth from the town for him. I generally fetched things from the shop, patterns and things for him, as I went back and forth from market.

Cross-Q. 23. What business was he carrying on at his shop then?

A. He was doing job-work generally, and working at such machines as this.

Cross-Q. 24. Was any regular manufacturing business being carried on at the shop then?

A. No, sir; there had been before that.

Cross-Q. 25. What had there been before that?

A. Manufacturing Drawbaugh's measuring faucet there.

Cross-Q. 26. What other models, or things of his invention, did you see in his shop at the time you saw "F" and "B"?

A. I remember of seeing his patent nail-feeder there.

Cross-Q. 27. What else?

A. I don't remember of anything else—not until afterwards I saw several other things there after I saw this.

Cross-Q. 28. What did you see there afterwards of his invention?

A. I saw a battering ram for hoisting water. I seen different other little machines there. I suppose they were patterns, or models, or things lying around.

Cross-Q. 29. What part of the shop did you see "F" and "B" in?

A. I saw it on the second floor. The first floor is where you come in where the machinery is. I saw it on the second or upper floor.

Cross-Q. 30. There is a basement or cellar under the floor, which you speak of as having this machinery on, is there not?

A. Yes, sir; there is.

Cross-Q. 31. What part of the upper story did you see these two instruments in?

A. The one machine was at the west end of the shop, next the road, and the other was at the other end of the shop, next to the creek.

Cross-Q. 32. Both in one room?

A. No, sir.

Cross-Q. 33. Describe how that story was partitioned off, and which room you saw the other in.

A. These rooms were just partitioned off; one in each corner of the building.

Cross-Q. 34. Which corners, and how did the partitions run?

A. The one room was in the west end of the building, or west corner, and the other was in the opposite corner of the building, north, as near as I can tell the way the building stands—the corner up the stream of the Yellow Breeches creek.

Cross-Q. 35. Did each of these rooms run across the whole end of the building, so as to have two corners of the building in it?

A. No, sir.

Cross-Q. 36. Then, if I understand you, one room was partitioned off by one partition in one of the corners of the west end, and the other was partitioned off by another partition in the corner next the creek up stream.

A. Yes, sir.

Cross-Q. 37. What else did you see in either of the rooms where either of these instruments were?

A. The one room was used as a faucet room; the other I don't remember; there were a great many things in it.

Cross-Q. 38. Name some of the things you saw in it.

A. I seen a couple of clocks in.

Cross-Q. 39. What kind of clocks?

A. He called them electric clocks.

Cross-Q. 40. Which room were they in?

A. The one at the west end of the building.

Cross-Q. 41. Were those clocks in cases, or were their works all open and uncovered?

A. The one clock I seen there was in a case, I am sure; the others I couldn't tell you.

Cross-Q. 42. I suppose you mean that you saw these clocks at the same time you first saw "F," and "B," don't you?

A. No; it was some little time after, that I first saw these two clocks. It was in the same room, though.

Cross-Q. 43. Tell me what you saw in these two rooms, the first time you saw "F" and "B" in them.

A. The one room I can't tell you. The other room was used for nothing else but a faucet room. I couldn't name anything else particularly that was in there.

Cross-Q. 44. How soon after you first saw "F" and "B," did you see the clocks?

A. That I can't tell you. I've got no account of dates in the year.

Cross-Q. 45. How many clocks did you ever see there?

A. At any time during my visits to the shop there? I have seen four at one time, if I remember rightly.

Cross-Q. 46. When was that?

A. I couldn't give you the exact time, for I was there too often at the place.

Cross-Q. 47. In what year did you see the four clocks?

A. As near as I can tell, I think it was in '72; I ain't right sure about that.

Cross-Q. 48. Where did you go to live when you left Eberly's Mills?

A. The place I live now, Dillsburg; that is my post-office.

Cross-Q. 49. Have you ever been to Drawbaugh's shop since you moved away from Eberly's Mills?

A. I was there twice since.

Cross-Q. 50. When?

A. The first was about two years after I left, and the next was about four years, as near as I can tell you, from the time I left; I am not positive.

Cross-Q. 51. How often have you seen "F" and "B" since you moved away?

A. I haven't seen it at all; my visits were too short at that time. I didn't see anything.

Cross-Q. 52. Do you mean to say that since you moved away you have never seen "F" and "B" until this morning?

A. I saw them before, since that, but not at them two visits.

Cross-Q. 53. When did you see them?

A. About a year ago.

Cross-Q. 54. Where was it, and who showed them to you?

A. At the place I worked; they were shown to me by Mr. Jacobs.

Cross-Q. 55. Did you make an affidavit about them about that time?

A. I did, in August of the same year.

Cross-Q. 56. Who was present when Mr. Jacobs showed them to you, and who was present when you made the affidavit?

A. There was another gentleman with Mr. Jacobs, but I don't remember his name. When I made the affidavit, Mr. Jacobs and Mr. Abrams were there.

Cross-Q. 57. Anybody else?

A. Jacob E. Smith and 'Squire Clark; it was at his office, at Dillsburg.

Cross-Q. 58. Are the instruments "F" and "B" in the same condition now that they were in when you saw them at Drawbaugh's shop?

A. No, sir.

Cross-Q. 59. What are the differences?

A. There was a kind of a funnel or a covering fixed up at this end [indicating end of machine "B," furthest from the electro-magnet,] of this machine. This here [magnet] I think was larger on "B." If I remember right, there was a head over the end of the tube next to the magnet. Don't distinctly remember any other differences in "B." I don't remember any particular difference in "F," more than that he had more plaster-of-Paris inside of it.

Cross-Q. 60. How was the inside of "F" made when you saw it at his shop?

A. I know nothing more than the plaster-of-Paris that was in it; he told me that. I hadn't the machine open. The two machines were connected together with wire.

Cross-Q. 61. Was the bottom broken out of the tumbler "F" at that time?

A. No, sir; it would hardly have held what was in it, if the bottom had been out.

Cross-Q. 62. Were the instruments lying on a bench when you first saw them, or were they put away somewhere and taken out by him to show you after you got in there?

A. Just as I first stated; there was one in each room, and I can't tell you any more how they were fastened.

Cross-Q. 63. Who else was present when you first saw them?

A. I don't remember that there was anybody but myself and Drawbaugh.

Re-direct by Mr. Hill:

Q. Q. 64. You state, that when you first saw the machines, they had, before that time, been making faucets there. Do you know how long before?

A. I guess about a year before that—eighteen months, or somewhere there.

Q. Q. 65. Do you know whether they made faucets there after that time as well as before?

A. Not while I lived there, and I don't think since.

Q. Q. 66. Were you down at the shop often during the latter part of your residence there?

A. Yes, sir; I was.

Q. Q. 67. Did you move away from there before Hauck & Co. took control of the faucet business?

A. Yes, sir; I moved away there before that.

Q. Q. 68. Was there anybody besides Drawbaugh working in the shop while you lived there, to the best of your recollection?

A. Not after the faucet business stopped, excepting that he would get a hand every now and then to help him work.

Q. Q. 69. When you first saw the two clocks there, one of them, you say, was in a case. Describe the case, as near as you can; tell how large it was, where it stood, and what it stood on.

A. It stood in that room in the west end of the building. I know that the clock was as high as I am, but whether it stood on the floor, or two feet off the floor, I don't remember.

Q. Q. 70. Did it look like an old piece of work?

A. No, sir; it was a new piece of work, very handsomely made. Drawbaugh made it himself, he told me.

Q. Q. 71. Was it an electric clock or not?

A. Yes, sir; he told me so.

Q. Q. 72. Do you recollect a clock there that had a dial with a moon in the face of it?

A. Yes, sir; it was, I think, one of these old-fashioned clocks—eight-day clocks.

Q. Q. 73. Was that there when you first went there?

A. I think it was.

Q. Q. 74. At the time you saw the two clocks, the second clock, as I understand you, was not in a case. Am I correct in that?

A. I don't remember of seeing more than one case; that of the large clock.

Q. Q. 75. At the time when you saw the four clocks there, were they in cases or not?

A. I don't remember of seeing more than the one in the case.

Q. Q. 76. Do you know whether they were not clock works that had been brought there for Mr. Drawbaugh to repair?

A. He told me he made them.

Q. Q. 77. Were they running, any of them?

A. I am sure that there were two running when I was there.

Q. Q. 78. Did they run by weights?

A. No, sir.

Q. Q. 79. By springs?

A. No, sir. They run by a wire he called an electric wire. I don't know where he had that attached to; he had one end attached to the clock.

Q. Q. 80. Were these clocks that were running sitting on his work-bench?

A. They were fastened up against the partition.

Re-cross by Mr. Storrow:

Re-cross-Q. 81. You have described these two rooms that you saw these two instruments in. Suppose a person were talking in one and another person listening in the other, without the aid of these machines, was there anything except a single board partition to prevent the sound passing from one room to the other?

A. There would be a double board partition between them; that is two inch board partitions, with an intervening room between the partitions.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 3d day of May, 1881.
FRED. M. OTT,
Examiner.

DAVID B. CARL.

Adjourned until 2.15 o'clock, P. M.

JACOB E. SMITH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Thirty-five years; residence, near Dillsburg, York county, Pennsylvania; occupation, laboring.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.; and, if so, how long have you known him?

A. I do, since 1870; maybe a little longer than that.

Q. 3. Did you, at one time, go to his shop at Eberly's Mills, to see his talking-machine?

A Yes, sir.

Q. 4. How happened you to go there at that time?

A. Curiosity prompted me to go there. I didn't believe that there was a machine could be made to talk from one place to another.

Q. 5. Who excited your curiosity about it?

A. Mr. Cyrus Orris and others talking about it.

Q. 6. How did you happen to hear Cyrus Orris and others talking about it at that time?

A. We were talking about Daniel Drawbaugh being a very smart man, inventing machinery of all kinds, and a talking-machine.

Q. 7. Where was this talk about Drawbaugh—where were you?

A. We were at Mr. Orris' house.

Q. 8. Where did Mr. Orris live?

A. At Etter & Shanklin's mill, about a quarter of a mile from Drawbaugh's shop.

Q. 9. Where were you living at that time?

A. Dillsburg, York county, Penna.

Q. 10. How happened you to be at Mr. Orris' house at that time?

A. I was married there.

Q. 11. Did you marry Mr. Orris' daughter?

A. No, sir; a step-daughter.

Q. 12. What was the date of your marriage?

A. March 26th, 1871.

Q. 13. How long was your visit at Mr. Orris' house at the time of your marriage?

A. Four or five days, as near as I can tell.

Q. 14. What did you hear Mr. Orris say about the talking-machine that so excited your curiosity to see it?

A. Talking from one apartment of the house to the other, and even further than that.

Q. 15. Did he give you any description of the machine before you saw it?

A. No, sir.

Q. 16. How soon after that conversation with him did you go to see the machine?

A. Within a few days.

Q. 17. Did anybody go with you? If so, who?

A. Mr. Cyrus Orris.

Q. 18. Tell us all about your visit to the shop when you went to see the machine?

A. Mr. Orris and I went there. Mr. Drawbaugh was not at home. A young lady brought the key and let us in the shop; others went in also with us. I don't know them, for my part; am not acquainted with them. Saw the talking-machine, or so-called, and the conversation started about it in the crowd. If I mistake not, it was made mention that any one could hear a man talking in New Cumberland by speaking through this machine.

Q. 19. Did you have any talk through the machine at that time, or hear any, and, if not, why not?

A. No, sir; no person there to operate. One part of the machinery was locked in another room.

Q. 20. Then you only saw a part of the machine at that time?

A. Yes, sir.

Q. 21. Do you see here the part that you saw there then?

A. I do [indicating "B"]. It is not quite as then.

Q. 22. What is the difference between it now and then, as far as you remember?

A. There was an extension here, as near as I can tell [indicating the end of the tin tube farthest from the electro-magnet]. This, [the electro-magnet,] I think, was some larger. It appears to me there was some kind of covering over this here, [indicating the end of the tin tube nearest to the electro magnet.]

Q. 23. Did the machine "B" appear to be connected in any way with the room that was locked? If so, how?

A. By wires stretched or extended, I think, from the machine to the room.

Q. 24. Do you remember the appearance of those wires?

A. As near as I can recollect, they were wires covered with some kind of cloth or thread, or something; I won't say positively what.

Q. 25. While you were there with the crowd looking at the machine, did Mr. Orris tell the party what he had seen or heard of the machine? If so, what did he say?

A. Not as I remember of; conversation was altogether; a whole crowd of us. I couldn't specify what any one particular one said.

Q. 26. Tell us all that you recollect that was said on that occasion.

A. Talking through this machine to persons in other parts of the house, and even further than that. Some one made mention, you could hear it as far as New Cumberland, or maybe further. I believe that is about all I recollect, at the time.

Q. 27. Do you recollect whether or not, at the time, it was said that the voice of the person speaking could be distinctly recognized or not through the machine?

A. Yes, sir; during the visit. I specify no particular time.

Q. 28. Do you mean that visit to the shop, or that visit to Mr. Orris'?

A. During the visit to Mr. Orris'.

Q. 29. Do you remember whether anybody there at the shop, at that time, spoke of having talked through the machine, or heard through it themselves?

A. I won't be positive about that; it most runs in my mind that I did hear some one make mention about hearing them talk from one apartment to the other.

Q. 30. How many persons were present there in the shop, at the time of that visit, to see the machine?

A. I would suppose about a half a dozen, as near as I can tell.

Q. 31. Do you know who the young lady was who brought you the key?

A. I won't be sure; I think it was Drawbaugh's daughter.

Cross-examined by Mr. Storrow:

Cross-Q. 32. When did you next see that instrument "B" after that time?

A. I can't give no dates. Say through the spring or summer of '72. I generally visit about twice a year down there—spring and fall.

Cross-Q. 33. When did you next see it after that?

A. I won't specify no particular time; but at different times.

Cross-Q. 33½. How many times have you seen it?

A. I couldn't give no particular number.

Cross-Q. 34. Have you seen it every year?

A. I might have; and other curiosities drawed my attention, I didn't take particular notice of the machine.

Cross-Q. 35. What other curiosities?

A. The electric clock, so called.

Cross-Q. 36. What others?

A. Different things. I couldn't just specify in particular what; that was one of them.

Cross-Q. 37. When did you last see machine "B"?

A. I couldn't give no particular date of that.

Cross-Q. 38. Have you seen it this year, before to-day?

A. No, sir.

Cross-Q. 39. Did you see it last year?

A. Yes, sir.

Cross-Q. 40. When and where?

A. At 'Squire Clark's, Dillsburg, York county, Pennsylvania.

Cross-Q. 41. When was it, and who was present?

A. In the month of August. Abraham, Jacobs, Carl, and Clark were present.

Cross-Q. 42. Have you ever had any talk with anybody about Drawbaugh's talking-machine?

A. Not more than I have made a statement here to-day; not as I recollect.

Cross-Q. 43. Did he have a good many things that he was inventing and getting up, since you have known him?

A. Not in particular; different things I have heard him talking of.

Cross-Q. 44. What other things do you know of his having manufactured?

A. Fusible plug, a patent nail-feeder, I believe, and other things I have heard of.

Cross-Q. 45. Were the curiosities you saw at his shop things he had invented?

A. Yes, sir.

Cross-Q. 46. He is a good deal of a man to contrive a thing, and then, as quick as he has contrived it, lay it aside and take up something else, isn't he?

A. That is more than I am able to tell.

Cross-Q. 47. You made an affidavit last summer, didn't you?

A. Yes, sir.

Cross-Q. 48. What did they tell you they wanted that affidavit for?

A. I don't know as they told me in particular what.

Cross-Q. 49. How long have you lived at Dillsburg?

A. Since 1865.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 3d day of May, 1881.

FRED. M. OTT,
Examiner.

JACOB E. SMITH.

Adjourned until 9, A. M., 4th inst.

May 4, 1881, 9 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

CYRUS ORRIS, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Forty-nine; Cumberland county, a quarter of a mile below Eberly's Mills, and work in the mill.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, and, if so, how long have you known him?

A. I have known him about twenty-five years.

Q. 3. How long have you resided near Eberly's Mills?

A. Thirteen years last April—1881.

Q. 4. Then you went to reside there in April, 1868?

A. Yes, sir.

Q. 5. Do you know Jacob E. Smith, who has testified here, and is he in any way connected with your family?

A. Yes, sir; he is married to a step-daughter of mine.

Q. 6. Did you hear the testimony that he gave here yesterday?

A. Part of it.

Q. 7. Do you remember anything about taking him to Mr. Drawbaugh's shop to see the talking-machine there?

A. Yes, sir.

Q. 8. Was that before or after his marriage to your step-daughter?

A. After.

Q. 9. How long after?

A. Just a short time—the next day or so after.

Q. 10. Tell us all about that visit to the shop to see the talking-machine.

A. The talk was about Dan being a smart man, and what he had been inventing, and was working at a concern that he said a talking-machine, and he was going to have it in place of a telegraph, to talk from one house to another, in the place of writing or telegraph. He was anxious (Smith) to go up to see it. I told him we would walk up, and Dan was pretty much all the time there. It happened, though, that he was not there; there was a girl there, unlocked the shop, and let us in. We saw the boxes there; we only could get into the one room.

Q. 11. Do you remember what particular machines you saw there at that time? Do you see them on the table?

A. No; I couldn't just say in particular, because I was going back and forward there once and twice a week, still.

Q. 12. At that time, when Mr. Smith and you went to the shop to see the machines, you didn't talk through them, did you?

A. No, sir; nor I didn't hear no talking. He had showed me his boxes before that time, and told me what they were intended for, and they were nothing new to me when I took Mr. Smith there to look at things. I was looking at other things, and I took no particular notice of any of them. The whole talk had been about this machine in that neighborhood. It didn't become anything new to me.

Q. 13 Had you heard the machine talked through before that time?

A. No, sir. I heard other ones saying that he had been talking through it, from the lower part of the house up into the room where he worked in.

Q. 14. When Mr. Drawbaugh, before that time, showed you his boxes and told you what they were intended for, what did he say to you about them? Tell us all that he said, as near as you can remember.

A. That he was going to have it to talk from one house to another, and as far as New Cumberland; and his boxes he would have on his benches there. He still would show me a little how he was fixing it and working at it. That is about all, I guess.

Q. 15. Were you about the shop frequently from that time down to the summer of 1880?

A. I was there the first year pretty often; about twice a week; next I wasn't so often; been going in about four or five times in a month, from that time down to last summer.

Q. 16. During all that time, from 1871 down to 1880, was Drawbaugh still working at his talking-machines, or not?

A. He was, I guess. They were always improved. I could see it in his improvement. I would still ask him what such boxes was intended for, and he would tell me it was for a talking-machine. I didn't ask him many questions. It always appeared to me that he didn't care about being bothered.

Q. 17. Did you ever see these two machines, "F" and "B," now on the table? If so, when did you first see them?

A. I don't like to pick on any of them, for I have seen them all, and what I saw first I can't remember.

Q. 18. Did you ever see this machine "C"? If so, when first?

A. I couldn't tell when I first seen it. I saw, I suppose, every one of them, when he was working at them. Never talked through any of them, nor never marked any particular time I was there.

Q. 18½. Do you recollect seeing this machine "A" there at any time?

A. I have seen such boxes, only at what time I couldn't tell.

Q. 19. These machines, "D" and "E," with the curled magnets, did you ever see them? If so, when?

A. I couldn't say. I saw boxes. You know he would have them on his benches, when I would be coming in; he would be working at them. It may have been this box, [taking up "D,"] or this one, [taking up "E."] I would take them up and look at them—took a view of them, set them back carefully—that is the way I would handle these things—not mark any of them.

Q. 20. Do you know anything about his working in the shop late at night?

A. Yes, sir; I have been at the shop at ten o'clock at night, and he was working, and I saw the light in the shop, many a time, at twelve o'clock and after.

Q. 21. What did you find him working at when you would go into the shop late at night?

A. A couple of times that I was in, I found him working at boxes for his talking-machine. That was the talk all through the neighborhood—the general talk, about him working at night at these boxes—this talking-machine.

Q. 22. Was your dwelling so situated that you could see from it his light in the shop?

A. Yes, sir; from the barn. I could see it from the window and from the porch. In summer, when the leaves were out, I couldn't see it from the house, but I could see it in the winter.

Q. 23. Was the light in his shop, in winter nights, a very frequent occurrence or not?

A. Pretty much every time I would take notice.

Q. 24. Do you recollect seeing lines of wire running from Mr. Drawbaugh's shop out along the creek?

A. Yes, sir.

Q. 25. About when did you last see them there?

A. I can't tell; I saw the wires and box he had fixed up, down along the creek in a big ash stump.

Q. 26. How many times did you see wires extending out from the shop along the creek, or elsewhere?

A. I saw that one wire down twice.

Q. 27. Give us your best recollection as to the time when you last saw it, and how long that was after you first saw wires extending out along the creek.

A. They were close both times I saw it; there was the one wire, and I can't remember rightly how far back to put it, or when it was.

Q. 28. State whether it was several years ago.

A. It was several years back, but I can't tell how many.

Q. 29. Could you recognize the instrument now, that you saw on the stump?

A. I don't think I could.

Q. 30. Look at this instrument, marked "H," and see whether or not you remember that as the instrument?

A. He had it setting up on boards on the stump and a wire run down, and he didn't take the cover off of it to see what he had there. It was shaped something like square. I can't say whether "H" is the instrument or not.

Cross-examined by Mr. Storrow:

Cross-Q. 31. Did you and Mr. Smith go alone to Drawbaugh's shop the day after Smith's marriage, or did anybody else go with you?

A. I can't remember of any one going along.

Cross-Q. 32. Didn't Mr. Condry go with you?

A. Not that I remember; he might have.

Cross-Q. 33. You say, in your testimony, the talk was about Dan being a smart man, and what he had been inventing. What did he ever invent, or what did you ever hear he had invented?

A. I heard different things.

Cross-Q. 34. Name some of them.

A. Faucets, clock, what he called a battering-ram—that he invented. I think there was such talk.

Cross-Q. 35. Wasn't he a man who kept his family pretty well?

A. I wasn't much in the house, but, I suppose, the best he could.

Cross-Q. 36. Wasn't it generally understood that he was able to keep them well?

A. I don't know as it was.

Cross-Q. 37. What years was it when he was working nights on the talking-machine? Was it one year, or all the years from 1871 to 1880?

A. It was pretty much all the years since I live there.

Cross-Q. 38. When did you last see any of these instruments on the table before to-day?

A. I can't tell you.

Cross-Q. 39. Were they shown to you last summer or last autumn?

A. I can't tell you anything about it.

Cross-Q. 40. Why can't you tell me?

A. I can't tell the time for certain.

Cross-Q. 41. Have you seen them at any time within the last year?

A. Yes, sir.

Cross-Q. 42. Who showed them to you then?

A. I saw them here.

Cross-Q. 43. What do you mean by here?

A. I mean this last year.

Cross-Q. 44. Who showed them to you the last time you saw them before to-day?

A. No particular person.

Cross-Q. 45. Where was it that you last saw them before to-day?

A. Last in here, in this room.

Cross-Q. 46. When was that?

A. Yesterday.

Cross-Q. 47. How long before that was it that you had seen them?

A. I can't tell.

Cross-Q. 48. Had you seen them any time within a year before yesterday?

A. Yes, sir; I saw them different times, but I can't tell the times or dates.

Cross-Q. 49. Where have you seen them within a year before yesterday?

A. I can't tell, hardly; I saw them different places.

Cross-Q. 50. Name some one of the places.

A. I saw them at Milltown.

Cross-Q. 51. Name some other.

A. I saw them over here in the office.

Cross-Q. 52. Name some other place.

A. I don't know.

PHONE COMPANY,-1

Cross-Q. 53. Who was present at Milltown when you saw them this last time?

A. Daniel Drawbaugh.

Cross-Q. 54. Who else?

A. I think it was Lee; I am not certain.

Cross-Q. 55. Who else?

A. Mr. Jacobs.

Cross-Q. 56. Did you make an affidavit about them?

A. I told them to the best of my knowledge. I couldn't just think of it at that time.

Cross-Q. 57. Did you sign, and swear or affirm to, a statement at that time?

A. Yes, to the best that I knowed.

Cross-Q. 58. Do you know Winfield Gross?

A. Yes, sir.

Cross-Q. 59. What connection of yours is he?

A. Son-in-law.

Cross-Q. 60. When was he married?

A. I can't tell you.

Cross-Q. 61. Warm weather, or cold weather?

A. It was in the fall, I think.

Cross-Q. 62. You went up to Dan's shop, to see his talking-machine, just after Gross' marriage, didn't you?

A. I don't remember.

Re-direct examination by Mr. Hill:

Q. Q. 63. At the time you made the affidavit for Mr. Jacobs, when Mr. Drawbaugh and Mr. Lee were present, did you tell them about taking Mr. Smith there to see the talking-machine, about the time of his marriage?

[*Objected to by Mr. Storrow as incompetent.*]

A. I could remember of me and him going up; I told them that.

Examination taken, reduced to
writing, and by the witness affirmed
and subscribed to before me this
4th day of May, 1881.
FRED. M. OTT,
Examiner.

May 4, 1881, 2 *o'clock*, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

JOHN SCHERICH, *being produced and affirmed, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is sixty-nine years and one month; born 1812, the 7th of April. My residence is Mechanicsburg, Cumberland county, Pennsylvania. I was a carpenter, then a farmer, and now am an insurance agent.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania? If so, how long have you known him?

A. I have known him since he was a little boy.

Q. 3. Did you at one time reside at Camp Hill, about a mile and a half from Eberly's Mills, Cumberland county, Pennsylvania? If so, when did you move there, and when did you move away from there?

A. I did; I moved there about the first of April, 1873, and moved away about the first of April, 1875.

Q. 4. Before you moved to Camp Hill, were you ever at Daniel Drawbaugh's shop, at Eberly's Mills; and if so, did you see anything there which he called a talking-machine?

A. Yes, sir.

Q. 5. To the best of your recollection, how long was it before you moved to Camp Hill that you first saw the talking-machine?

A. I think it was, as near as I can tell, in 1869—that is about four years before, I guess.

Q. 6. Please look at the instruments marked "B" and "F," and state whether you saw either of them at the time referred to before you moved to Camp Hill.

A. Yes; I saw them, or a set exactly like them.

Q. 7. Did you have any talk with Mr. Drawbaugh about it at the time you first saw it? If so, what was the conversation?

A. He was telling me that it was a talking-machine, he called it, and we were upstairs in the third story of the building, in his shop. He went down into the basement, and I staid up in the shop. He talked down there, and I listened up above, and I heard what he then said; then I went down in the basement where he was; then he showed me this tumbler [indicating "F"] or one just like it, that he was talking into. After that we went up stairs again into his shop. This machine "B" was up there, or one like it, the whole time.

Q. 8. Did you ask him on what principle the machine operated?

A. Yes.

Q. 9. What did he say?

A. He said it was better and handier than the telegraph; that you could just talk through it in place of writing.

Q. 10. State whether you saw these two instruments again after you moved to Camp Hill, and while residing there.

A. I did. I saw those and some other machines. He said he had made an improvement on it.

Q. 11. Did you talk through any of the machines again, while you lived at Camp Hill?

A. Yes.

Q. 12. When you listened at the machine, before and at the time you lived at Camp Hill, could you hear the sound of the voice that was talking in at the other end of the line so as to distinguish whose voice it was?

A. Yes; it was his voice.

Q. 13. Please look at the instrument which I now show you, marked "A," and state whether you ever saw that before. If so, state when you first saw it.

A. I saw it when I lived at Camp Hill; it was at the factory—the shop.

Q. 14. Do you remember what you were doing at the time you saw that instrument marked "A?"

A. Yes; I had some apples, and went there to make cider, and him and I were in the shop at that time a good while by ourselves.

Q. 15. About what time of the year was that?

A. In the fall, about the time for putting away winter apples.

Q. 16. When were you last at Mr. Drawbaugh's shop?

A. That was the last time, to the best of my knowledge, that I was in his shop.

Q. 17. At that time, when you were there making cider, did he talk through the instruments?

A. Yes.

Q. 18. Do you remember whether this instrument, "A," was used at that time for listening at?

A. Yes; or one exactly like it, that I could not tell the difference.

Q. 19. Did you put it to your ear in listening?

A. Yes, sir.

Q. 20. Could you hear through it what was said at the other end of the line?

A. Yes, sir.

Q. 21. Where were you when you listened at it, and where was Mr. Drawbaugh?

A. I was in the shop, and he had went down stairs.

Q. 22. Were you on the upper floor?

A. Yes, on the third floor of the shop.

Q. 23. What floor was he on when you were listening at "A"?

A. He went down again to the basement.

Q. 24. Did you see what instrument he was talking into at that time?

A. Yes, he showed me after I went down.

Q. 25. Do you remember what kind of an instrument it was that he was talking into?

A. It was a kind of a little box that he was talking into. I can't remember the shape of it exactly; it was so long ago.

Q. 26. Was it this instrument "F," or some other instrument?

A. It was different from this. He said it was an improvement from the first one.

Q. 27. Was that in the fall of 1874?

A. Yes.

Q. 28. Look at this box, marked "I," and see whether this looks like the instrument that he spoke into in the fall of 1874.

A. It looks like it.

Cross-examined by Mr. Storrow:

Cross-Q. 29. How many other talking instruments did you ever see at Mr. Drawbaugh's shop?

A. Oh, he had different machines there at that time, but I couldn't tell anything about them. That is all that I seen in use.

Cross-Q. 30. Were the other machines talking-machines?

A. I can't tell that; I don't remember.

Cross-Q. 31. Didn't he tell you what some of the other machines were for?

A. I can't recollect. His mind was taken up pretty much with talking about the talking-machine, but I don't recollect much else.

Cross-Q. 32. Didn't he tell you he had made other talking-machines besides the four instruments you have spoken of?

A. Not that I recollect; only that he was making improvements on it.

Cross-Q. 33. How often did you go to his shop while you lived at Camp Hill?

A. I can't tell whether I was in his shop more than once while I lived at Camp Hill, or not. All I recollect is that we had this up the time I was there making cider.

Cross-Q. 34. Why did you go to his shop to make cider?

A. They had a press in the basement that ground the apples by water.

Cross-Q. 35. Who was present on either of these occasions, when you say you saw these talking-machines?

A. There was no person with us when we were there.

Cross-Q. 36. Have you ever seen Drawbaugh since you left Camp Hill?

A. Oh, yes; I have seen him frequently.

Cross-Q. 37. Where have you seen him?

A. He had moved to Mechanicsburg since that. I have seen him there; met with him different times.

Cross-Q. 38. Do you mean that he moved to Mechanicsburg, or that you did?

A. He lived in Mechanicsburg, I think, one year. I have been living there ever since.

Cross-Q. 39. There is considerable manufacturing and machine-shop work carried on at Mechanicsburg, isn't there?

A. Yes, sir; Haucks had a machine-shop there, manufacturing plows, rakes, and other machines.

Cross-Q. 40. Did you ever see any of the other machines Drawbaugh invented or made, such as his faucet and electric clock?

A. I seen a clock there and a faucet. At one time I had a power of attorney to sell territory for manufacturing faucets under his patent.

Cross-Q. 41. When was that?

A. It was in 1867 or 1868, I can't just mind the date. I sold them faucets around home, too. That took me frequently to their shop to get faucets.

Cross-Q. 42. Was he manufacturing them, then, at his shop?

A. They were manufactured on the second floor.

Cross-Q. 43. Did you ever see an electric clock of his?

A. I saw that several times that I was there.

Cross-Q. 44. When did you see any of them?

A. The time I was there getting faucets, still. I was up different times that I saw it. The day that I saw this [indicating "F"] there were no hands at work in the shop.

Cross-Q. 45. In what year was it that you first saw the electric clock at his place?

A. That I can't tell.

Cross-Q. 46. Was it before you went to Camp Hill, or after?

A. Oh, I seen the clock before I went to Camp Hill; I think so.

Cross-Q. 47. What did the clock look like? How big was it?

A. That I can't exactly tell; it appears to me it was like those old-fashioned eight-day clocks.

Cross-Q. 48. Have you ever done any insurance business with Drawbaugh?

A. I never took any insurance that I know of. I wanted to take his insurance, and he said he wasn't able. I once filled out an application for him at his home, and when he came in I wanted him to attend to it; he said he would as soon as he was able. That is several years ago; he said he was too poor, he couldn't afford it.

Cross-Q. 49. Where was his home then?

A. At Milltown, near the blacksmith shop.

Cross-Q. 50. Why did you go to his house then and not to the shop?

A. The house was close to the blacksmith shop. I staid at his house 'till he came from dinner and took dinner with him. I had been at the blacksmith shop to get a horse shod.

Cross-Q. 51. About how many times have you been at Eberly's Mills since you moved away from Camp Hill?

A. I wasn't there very often. I was there a few times that I was in the mill, and they had a little store that I was in several times, and then I was at the blacksmith shop several times. I got Fettrow to shoe my horse; my horse cuts himself, and I thought he could shoe him better than any one else. That is one reason that I stopped at that shop.

Cross-Q. 52. Are you quite sure that you didn't go to Drawbaugh's shop any of these times?

A. To the best of my knowledge, I wasn't in his shop since the time I made the cider; not that I can recollect of.

Cross-Q. 53. In your 48th answer, you say that he told you he would take a policy as soon as he was able; I suppose he has never been able, up to this day, has he?

A. I expect not; for he has never called on me. I left the application, so that he could call on a doctor and be examined; and that was the last I heard of it.

Cross-Q. 54. Have you ever spoken to him about any insurance since then?

A. I asked him when he came to Mechanicsburg. I told him, "Now, I suppose you are ready to take out a policy?" He said, "Not yet." I don't recollect anything else.

Cross-Q. 55. When was that?

A. Directly after he moved to Mechanicsburg. That is several years ago.

Cross-Q. 56. Have not said anything to him about it since this telephone business came up, have you?

A. Not that I recollect of.

Cross-Q. 57. Have you talked with him about telephones this last year?

A. Yes, sir. The way I came to talk to him—they have one in the Presbyterian church for the benefit of Dr. Young. When I seen it I just wondered whether it was like the one Drawbaugh had to talk through, and intended to go down to see it. So, one day, I was just taking water from the hydrant to water my horse; Drawbaugh opened the gate, came into the yard, and he asked where Seifert lived. I told him the next house. He turned around and I called to him: "Hold on here, I want to see you." He said he hadn't time, he was in a great hurry. I told him that I was in a hurry, too, but that I wanted to see him particularly; that I was in the Presbyterian church and seen a talking-machine there, and I wanted to know whether it was like his. He asked me then when I seen his machine. I told him that I saw it in the shop there. He said he had forgotten it, he didn't mind of me being there. He wouldn't tell me anything. He said his lawyer was up town and he wanted me to go with him and tell what I knew about it. I went with him. I didn't know he had any lawyer in town, or anything about it at the time. I went up and I met the young man there. He asked me whether I had seen those machines. I told him I had seen them years back, but I hadn't given it any attention until I seen that machine there; that drawed up my memory again.

Cross-Q. 58. Did you make an affidavit at that time?

A. No, sir; after that he came there and I made affidavit before Shelly, notary public.

Re-direct examination by Mr. Hill:

Q. Q. 59. The faucets were manufactured by a company about 1868 or 1869, were they not?

A. Yes, sir; before that, I think.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to this 4th day of May, 1881, before me.

FRED. M. OTT,
Examiner.

JOHN SCHERICH.

HENRY C. SPRINGER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is fifty-two, on the fifteenth of April; my residence is Andersontown, York county, Pennsylvania; occupation, a shoemaker.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania? If so, how long have you known him?

A. I have known him about eight years.

Q. 3. Did you at one time reside at Eberly's Mills? If so, when did you commence to reside there and when did you move away?

A. I commenced there April 1st, 1876, and moved away about the sixth or seventh of January, 1877. I just rented a shop, and went there to work, boarded myself and lived there; my family stayed at Andersontown.

Q. 4. While so living at Eberly's Mills, did you, or not, frequently visit the shop of Daniel Drawbaugh?

A. Yes, sir; about twice a day, noon and evening.

Q. 5. During that time did you see there what he called a talking-machine?

A. Yes, sir; that is what caused me to go down there pretty much every time I went.

Q. 6. Did you go down to assist him about talking on it, or operating it?

A. He boarded with his brother, just above me, and he stopped,

PHONE COMPANY,-1

still, after dinner, and I said. "I will go along down, and we will talk through that machine," I told him it was a curiosity to me. I wanted to talk with him through it.

Q. 7. During the time that you lived there, as you have stated, did you see more than one talking-machine? If so, how many, to the best of your recollection?

A. I saw these six that lays here [indicating "B," "F," "D," "E," "G," and "O;"] these two are the first we talked through [indicating "B" and "F."]

[*Examiner notes that instruments "A," "C," and "I" are also on the table.*]

Q. 8. How soon after you talked through "B" and "F" did you talk through any of these other four, "D," "E," "G," and "O?"

A. It was about two months, as near as I can tell you, that he had these two, "D" and "E," or two exactly like them. He told me then that he had improved the machine; that he could talk both ways then. Then I went along down. The first we had we could only use to talk in one direction.

Q. 9. Referring to these two instruments, "B" and "F," which did he talk into and which did you listen at?

A. He talked into the glass tumbler "F," and I listened at the tin box "B."

Q. 10. Where were the two machines "F" and "B" when you were talking and listening?

A. "F" was in the second floor, in a little office that he had made partitioned off. "B" was on the back part of the machine-shop on the same floor.

Q. 11. Were they connected in any way? If so, how?

A. There was a fine wire ran through from one to the other.

Q. 12. Do you remember whether they were connected by one or two wires?

A. I think there was two wires; I think one went up, up-stairs like, and came down, and one went straight.

Q. 13. Were the wires wrapped or covered with anything?

A. Yes, I think they were covered with thread or silk, or something of that kind.

Q. 14. Do you remember what was the condition of the end of the tin box next to the electro-magnets?

A. Yes, sir; I think he had cut a piece out of a drum head and fastened it over the end of the tin box.

Q. 15. Did you remember whether there was anything attached to the piece of skin or drum head?

A. Yes, sir; he had a little bar of iron across, or steel, or something.

Q. 16. When he talked to you through these machines "B" and "F," did you understand what he said?

A. Yes, sir; quite distinctly.

Q. 17. Did you recognize his voice, so as to distinguish it from other persons' voices through the machine?

A. Yes, sir.

Q. 18. Do you remember how he came to show you these two machines, "D" and "E?"

A. He told me he had improved the talking-machine, and showed me these.

Q. 19. How came he to tell you that at that time?

A. He told me he had got the machine that we could talk both ways—I to him, and him to me.

Q. 20. Did you ask him first if he could talk both ways, and was this his reply? or was this his statement without any question?

A. He came down from dinner and stopped at my shop, and told me if I would go along down, now, we could talk to each other.

Q. 21. And when you went down, you talked through those machines "D" and "E," did you?

A. Yes, sir.

Q. 22. Was that the first time you had seen the machines "D" and "E?"

A. Yes, sir.

Q. 23. Do you remember any of the conversation that you had through those machines "D" and "E" at that time?

A. He asked me how I liked living in "bachelor's hall." I told him not very well.

Q. 24. After you had talked through the machines "D" and "E," did you again afterwards talk through "B" and "F"?

A. No, sir.

Q. 25. When did you see these two machines "G" and "O"?

A. About some time in October, 1876.

Q. 26. Did you talk through those machines "G" and ""O"?

A. Yes, sir.

Q. 27. Did you hear and understand what was said through those machines?

A. Yes, sir.

Q. 28. Do you remember whether or not you saw him making these two machines "G" and "O?"

A. No, sir; I did not see him making them.

Q. 29. Nor the others, "D" and "E?"

A. No, sir.

Q. 30. Did you, at any time when there, see this machine "C?"

A. I saw this in the office there; a little office he had.

Q. 31. When you first went there?

A. It was three or four weeks after I went there.

Q. 32. Do you remember seeing this box "I" there at any time?

A. No, sir; I don't recollect of seeing it.

Q. 33. Do you recollect of seeing this machine "A" there at any time?

A. No, sir; he must have got that after I left. I don't mind of seeing it.

Q. 34. Did you see him making any talking-machines while you were there, or working on them?

A. No, sir; I never got there only at dinner time, and in the evening when he quit work.

Q. 35. You have referred to seven machines in all as seen by you at that time—are these all the talking-machines that you saw there, or were there others?

A. These are all, to my recollection.

Q. 36. You gave us certain conversation that you had through the machines with Mr. Drawbaugh. Do you recollect any other conversations, or parts of conversation, that you had with Mr. Drawbaugh through the machines? If so, give them.

A. One Saturday afternoon he asked whether I was going down to Bridgeport. I told him, through the machine, that I was going, and asked him whether he would go along. He said—answered back—he would, and I says to him, "Suppose we go out to the pike to Kellers';" Kellers lived out at the pike. He answered back that he didn't know them. I told him, then I would make him acquainted. We talked a good little bit, that Saturday afternoon, back and forward. I can't recollect all that we said.

Q. 37. Did you ever whisper through the machine?

A. Yes, sir: talked low.

Q. 38. In all these conversations, were the machines in the places that you spoke of?

A. Yes, sir.

Q. 39. Any doors between them?

A. A board partition between them. He had a door in as you came up the steps, but the wires went through the partition.

Q. 40. In any of your conversations with Mr. Drawbaugh at that time, was anything said about getting a patent on the talking-machine?

A. Yes, sir; he said he would get it patented, but he was too poor; he couldn't afford it. There was several of us in the shop there, talking that his family were so opposed to him working on it, because it would never do him any good. That was the general talk there at that time.

Q. 41. Do you mean in his shop or in yours?

A. In my shop.

Q. 42. Who of his family opposed him about it—his wife?

A. Yes, sir, his wife; the way I can understand.

Q. 43. Do you mean that is the way you understood at the time?

A. Yes, sir.

Q. 44. Do you know anything about his poverty at that time?

A. Yes, sir; I done some shoemaking for him, and he hadn't money to pay me still. He did pay me before I left, but he hadn't money to pay me along, as I done it.

Q. 45. How large were your bills for shoemaking for him?

A. The highest bill he got done at one time, to the best of my recollection, was about eighty cents.

Adjourned until half past nine o'clock, A. M., May 5.

May 5, 1881, 9.30, *A. M.*

Examination of Mr. Springer resumed.

Same counsel present.

Examined by Mr. Hill:

Q. 46. You said yesterday that Mr. Drawbaugh spoke of patenting the machine if he was able, or if he had the means. Do you remember whether he spoke of this once or more than once? If the latter, how often?

A. About a half a dozen times.

Q. 47. Do you recollect whether he said anything about getting somebody else to go in with him to furnish the means?

A. Yes, sir; he told me if he just knowed who he could get, he would get him and go in with him.

Q. 48. Do you recollect whether he said anything about the value of the invention?

A. He said it would be a fortune to him and make him independent.

Q. 49. Do you recollect whether he compared it with telegraphing? If so, what he said?

A. He said it would far exceed telegraphing.

Q. 50. Do you remember whether, when he was speaking about his being so poor, he said anything about being heavily in debt at the time?

A. He said he was paying a heavy rent in Mechanicsburg, and he was losing by it, and was not making enough to meet his ends.

Q. 51. Do you remember what business was carried on in the building where Drawbaugh's shop was, at the time you were living in that neighborhood?

A. The main business was, while I was there, making iron axles for buggies.

Q. 52. Who was connected with that axle business, so far as you remember?

A. The time I was there, Jacob Kline and Bowman, a son-in-law of Kline, who lived at Camp Hill. Drawbaugh worked for them.

Q. 53. While you were at Drawbaugh's shop, at any time, did you see him exhibit his talking-machine to anybody besides yourself? If so, to whom?

A. No, sir. I went down about fifteen minutes at dinner time, and in the evening. There was no one in but him and I.

Q. 54. When you would go down in the evening, about what time would you generally go—right after supper or later?

A. Went down about dark and stayed there until about bed-time—talked there together.

Q. 55. How many times during that year did you stay there during the evening, to the best of your recollection?

A His family was in Mechanicsburg, and mine in Siddonsburg, and I would go down there pretty much every evening, and we were together pretty much all the time, outside of regular working hours.

Q. 56. Did you see an electric clock in his shop at that time?

A. Yes, sir; I did.

Q. 57. Was he doing anything at that?

A. Not at that time I was there. He had it running before I came there, and all the time I was there.

Q. 58. So far as you could see and know, during the time you were there, what was Mr. Drawbaugh principally giving his attention to?

A. His whole mind appeared to be on this talking-machine. He told me that many a night he didn't sleep, just studying how to improve it.

Q. 59. Were you ever in the shop before you went to Eberly's Mills to live?

A. I had business here in Harrisburg, in 1875. I had heard of his machine-shop—this talking machine of his—and I stopped in to see.

Q. 60. Did you then see any talking-machines?

A. He was busy at work. He told me that he had had it; that I should come down some other time, and he would operate them, So I didn't get down until the next spring, when I rented the shop, when I took my things down and commenced work, and then we would talk through it.

Q. 61. After you moved away from there, were you ever in the shop, or not?

A. No, sir; I have not been there since.

Q. 62. At the time when you were about the shop so much, where did he keep the machines? Were they always attached to the wires, or were different ones attached to the wires, and, when not in use, were they on the bench, or in a cupboard, or where?

[*Objected to by Mr. Storrow as leading.*]

A. He had a wooden box under a table that he had them in. He had these two ["B" and "F"] attached to the wires pretty much all the time, and he would change them and put other ones on when he wanted to talk.

Q. 63. These two instruments, "D" and "E," do you remember whether they both had the bottom covered at that time, or were they as now, one covered, and the other uncovered?

A. As near as I can recollect, they were just as they are now, the one was covered, and the other was not.

Q. 64. Do you remember their appearance when you first saw them, and if so, did they look as if they had just been made, or as if they had been made some time?

A. They looked about as old as they do now; as if they had been made a long while. I am satisfied they were not made new.

Q. 65. Do you remember how far the instruments were apart, when you talked and listened through them?

A. They were the whole length of the building, and through a partition. I suppose the building is sixty feet long; may be more. We put them as far apart as the building would allow.

Q. 66. Did he tell you at that time how far he could talk through them? If so, what did he say?

A. He said it could be made to talk across the ocean.

Cross-examined by Mr. Storrow:

Cross-Q. 67. Where did you move to when you left Eberly's Mills?

A. I built a house and moved to Andersontown, where I live now.

Cross-Q. 68. Have you lived there ever since?

A. Yes, sir.

Cross-Q. 69. You say that when you used the instruments they were somewhere about sixty feet apart. Were they both on the same story?

A. Yes, sir; they were both on the same story.

Cross-Q. 70. How many partitions between them?

A. One board partition.

Cross-Q. 71. Please describe how that story was partitioned off.

A. At the time I was there, a stairway went up to the second story, on the outside, on the north-west side, away from the creek, facing the hill as you go down the road. As you got up the steps, there was a platform some five feet square outside. There was a door opened into the second floor, as you came up, at the right hand. As soon as you got in, a door opened at the left into his office, at the north corner. It was an office partitioned off square, and he had "F" in it, and the wire ran through the partition and out to the back part of the building along the wall to the further end of the building. The balance of the room he had his works in—belts, and so on.

Cross-Q. 72. Then, if I understand you, that story had his little office room partitioned off in one corner, and all the rest of it was one room together. Was that it?

A. At the time I was there, it was.

Cross-Q. 73. What work was being carried on in the room in the second story?

A. Making these iron buggy axles.

Cross-Q. 74. Did this office run across the whole of one end of the building, or was it just in one corner?

A. About ten feet square, as near as I can tell you, in the north corner.

Cross-Q. 75. What else did he have in his office, besides the talking-machines that you spoke of?

A. All that I noticed was the electric clock, and those instruments, and the desk and table. He kept their books in the desk.

Cross-Q. 76. How many doors were there to the office?

A. One door to the office.

Cross-Q. 77. On which side?

A. On the east side, I guess you would call it; the corner next to where you enter the building.

Cross-Q. 78. Did he have a cupboard there to keep his things in?

A. He had a wooden box that he kept these instruments in, and desk that he kept his books in; no cupboard in it.

Cross-Q. 79. Where was the box kept?

A. He kept the box under a table that he had there.

Cross-Q. 80. Are these seven instruments that you have testified about in the same condition now that they were in when you lived at Eberly's Mills?

A. All as near as I can tell, only that piece is off of that one [indicating "G"] and the drum-head is not on that one, [indicating "B"] and some of the stuff has dropped out [plaster-of-Paris] of "B" and "F."

Cross-Q. 81. How often have you seen those instruments since you left Eberly's Mills, and before yesterday?

A. I didn't see them at all since; yesterday was the first.

Cross-Q. 82 I suppose you have talked with Drawbaugh, or somebody, about giving testimony in this case, before yesterday, haven't you?

A. Not that I can recollect. I don't think I seen Drawbaugh since, until yesterday.

Cross-Q. 83. Were you subpœnaed to come here and testify?

A. Yes, sir; very unexpected yesterday morning, by Constable Shank. I didn't get time to put on other clothes.

Cross-Q. 84. So you didn't know until yesterday morning that you were going to be wanted as a witness, didn't you?

A. No, sir; indeed, I did not.

PHONE COMPANY,-1

Cross-Q. 85. Where did Drawbaugh live while you worked at Eberly's Mills?

A. His family lived at Mechanicsburg, and he boarded at his brother John's, at Eberly's Mills.

Cross-Q. 86. Whereabouts in Mechanicsburg did his family live?

A. That I cannot tell you exactly.

Re-direct examination by Mr. Hill:

Q. Q. 87. Do you recollect whether this machine "F" had any drum-head about it?

A. It seems to me it had something like it inside. It was shut with something inside. It had someting like drum-head in it.

Re-cross by Mr. Storrow:

Re-Cross-Q. 88. Did you examine the inside of these instruments while you were at Eberly's Mills so as to know how their insides were made? I refer to the whole seven.

A. It was a curiosity to me. I examined these two, "B" and "F," and I seen they were shut with something like drum-head; the others I didn't examine as much as these two.

Re-direct by Mr. Hill:

Q. Q. 89. Do you remember whether the bottom of tumbler "F" was broken then as it is now?

A. Yes, sir; I think it was. I think it was in the same shape it is now.

Re-re-cross by Mr. Storrow:

Re-re-cross-Q. 90. Are you sure whether it was broken off or not?

A. Yes, sir; I am pretty positive that it was in the same shape that it is now.

Examination taken, reduced to
writing, and by the witness affirmed
and subscribed to this 5th day of
May, 1881, before me,
FRED. M. OTT.
Examiner.

HENRY C. SPRINGER.

DANIEL BALSLEY, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Forty-nine, on the fifth of last February; reside at New Cumberland, Cumberland county, Pennsylvania; am a wheelwright or wagon-maker.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania? If so, how long have you known him?

A. I have known him for thirty-five years.

Q. 3. Did you ever visit his shop, at Eberly's Mills, after the year 1870?

A. I did.

Q. 4. How many times?

A. Once.

Q. 5. When was that, as near as you can fix it?

A. In the year 1872, I think; may be a little before or after, won't be positive.

Q. 6. Where were you working or doing business at the time you visited his shop?

A. In my own shop at New Cumberland.

Q. 7. When did you commence to carry on business in your own shop at New Cumberland?

A. In 1871.

Q. 8. Do you think it was before or after the year 1874 that you visited his shop?

A. It was before 1874.

Q. 9. At the time you visited his shop, do you remember seeing the old saw-mill that formerly stood near the shop?

A. Yes, sir; it was in a dilapidated condition—nearly all gone.

Q. 10. Do you remember how you happened to go to Mr. Drawbaugh's shop on that occasion? If so, state.

A. I was foreman—carpenter, under master-mechanic John Horton, of Lochiel Iron Works. He asked me if I knew Daniel Drawbaugh. He asked me if I would go with him there, if he [Horton] would come to my place, he having left Lochiel, and gone to Wheatland, I forget what county, and returned. Then he and I went to Milltown.

Q. 11. Am I to understand you that Horton had formerly been master-mechanic at the Lochiel Iron Works?

HONE COMPANY,-1

A. Yes, sir; from 1865 to 1870.

Q. 12. And it was after he left there that this visit was made to Drawbaugh's shop?

A. Yes, sir; he came to see his family, who remained at Lochiel.

Q. 13. And was it after you had ceased to work for the Lochiel Iron Company?

A. Yes, sir.

Q. 14. Do you know why Horton wanted to go to see Drawbaugh?

A. He said he heard a great deal of him in Philadelphia. He (Horton) was from there.

Q. 15. State what took place when you and Mr. Horton arrived at Mr. Drawbaugh's shop.

A. I introduced Mr. Drawbaugh to Mr. Horton as former master-mechanic of Lochiel. Mr. Drawbaugh's face flushed up and he seemed glad to see him. After a little conversation with Mr. Horton, he says to me, Drawbaugh said: "Uncle Dan, I am working at something now, if I accomplish it will be worth thousands to me;" and then he produced a tin can. I think it was attached to a board—I think, with two pieces of strap-iron; and a tumbler glazed with plaster. The bottom was out of the glass. If I am not mistaken, I have not seen it since. He says, "By attaching two wires, you can hear it away off; the telegraph is nowhere with it." I replied to him, "If that be the case, don't let it slip like the 'Gifford Injector;' put it through at once." He replied, "I have not the means at the present time." Then he began to explain to me about it, and mentioned talking-machine, he was making. He got too deep for me, and I made up my mind he was out of his mind. I paid very little attention to it. Then I left his shop and went out to the saw-mill, and left Mr. Horton with Mr. Drawbaugh.

Q. 16. Do you recollect whether, during that interview, Mr. Drawbaugh said anything about getting others to help him—to furnish means, and take an interest in the invention? If so, what?

A. He said that if he had some person to help him they could make a nice thing of it very soon.

Q. 17. Do you remember whether he said anything about having tried to get others to help him, or not?

A. He asked his best friends, he said, and they all refused him.

Q. 18. Did you, at that time, have the means to take hold of the invention?

A. I could have helped him, but I would not have on that, because I did not understand it.

Q. 19. Is Mr. Horton now living or dead?

A. He died at Johnstown Iron Works several years ago.

Q. 20. Please look at the machines "B" and "F" now shown you, and state whether you have ever seen them before. If so, when?

A. I think I saw them two, and am most positive they are the only ones I saw at that time.

Q. 21. Did you hear any talking through them at that time?

A. No, sir.

Q. 22. Some time last fall, you made an affidavit for Mr. Jacobs or Mr. Drawbaugh about this matter, didn't you?

A. Yes, sir.

Q. 23. At the time you made the affidavit, did they show you the machines "F" and "B?"

A. They showed me two, and I think those are the two that Mr. Drawbaugh showed me; I think these are the ones.

Q. 24. Did they also show you other machines at that time?

A. I saw no other.

Q. 25. Did they show the machines before you had told them what you knew or after?

[*Objected to by Mr. Storrow as incompetent.*]

A. I stated first, and they drew them out.

Q. 26. State whether or not you have ever seen those machines between the time when you saw them at Mr. Drawbaugh's shop and the time when you saw them here lying on the table during this deposition, except the time when they took your affidavit.

A. I never saw them from the time I first saw them until the time they took my affidavit at the 'Squire's office, and I never saw them from that time till now.

Q. 27. Do you know anything about Mr. Drawbaugh's financial condition about the time you were there at his shop? If so, what was it?

A. He told me that if he had the means he would put this through very quick, besides some other things he would like to have, but he had not the means—was not able.

Q. 28. Did you know anything about his financial condition along in those years, besides what he told you at that time?

A. I did. He had some very good patents sold and intrusted to various individuals, and he lost all that he had made, and left him just where he had started, and I guess a little lower.

Q. 29. Was he a steady, hard-working man?

A. He was a very industrious, sober, hard-working man from the time he was thirteen years old to the present time. He made a rifle for me when he was thirteen years old.

Q 30. Do you know what is his general reputation in the community where he lives for truthfulness and honesty?

A. I believe he is truthful and honest; that is his reputation in the community where I live and where he lives. I live four miles away from him.

Q. 31. He is a good mechanic, is he not?

A. Yes, sir; in wood particularly; he can make anything.

Q. 32. Do you know why, being a good mechanic, he did not keep himself in funds by working as a mechanic?

A. He was generally working on patents, and all the money he could raise he took for that, and it left him in very penurious circumstances.

Adjournment for dinner, until 2, P. M. [Mr. Abraham came in during the examination.]

---

2 *o'clock, P. M.*

Examination resumed, pursuant to adjournment.

Present same counsel, with the addition of Mr. Abraham for respondents.

Cross examined by Mr. Storrow:

Cross-Q. 33. Have you ever been at Drawbaugh's shop since the visit you have described?

A. No, never.

Cross-Q. 34. In your fifteenth answer, you say that you told Drawbaugh not to let it slip like the "Gifford Injector." What do you refer to by that?

A. An injector that he had partly done, and some person had got it patented before he got to Washington.

Cross-Q. 35. Is that the injector that Sellers & Co. make in Philadelphia?

A. That I can't tell. I have been told by Criswell, the machinist at the mill, that that was the patent Drawbaugh was working at. I talked with Dan about it, too.

[*Mr. Hill objects to the statements of Mr. Criswell as hearsay, and as irrelevant and immaterial.*]

Cross-Q. 36. What talk did you have with Dan about the injector?

A. I never had no talk with him about it, only to ask him that question, as I stated before.

Cross-Q. 37. Did you ever know of any other inventions that Drawbaugh made, or claimed to have made, besides the ones you have mentioned?

A. Yes, sir; a stave-cutter, a stave-jointer, and nail-feeding machine and cutter, that I know and saw. He made a great many others that I never saw.

Cross-Q. 38. Tell me the others which you have heard of but have not seen.

A. He made a very nice tack-machine, to cut carpet tacks, a grand machine. I saw that, but I paid very little attention. I can't name the other machines that I heard of—different machines, I am told by the neighbors, that he is working on, but I never went to see them, for I cared very little about it.

Cross-Q. 39. Wasn't it rather curious that Mr. Horton should come and ask you if you knew Dan Drawbaugh, and ask you to go up and see him, when you had known him for twenty-five years?

A. Nothing curious about that. I was under Mr. Horton's control at Lochiel. I was living in Cumberland county. He was living at Dauphin. He was my superior at Lochiel. I often talked about it.

Cross-Q. 40. Talked about what?

A. About Drawbaugh.

Cross-Q. 41. You mean you had often talked about Drawbaugh with Mr. Horton before that?

A. Oftentimes.

Cross-Q. 42. What kind of talk had you had with Mr. Horton about Mr. Drawbaugh before that?

A. Of being a natural genius. I served apprenticeship the seven years and he never served any at all, and can make as good a wagon as I can.

Cross-Q. 43. Then, I understand, you had often talked with Horton about Drawbaugh and about his being a natural genius; did you ever

HONE COMPANY,-1

talk with him about the things Drawbaugh's ingenuity had enabled him to do?

A. I told him anything he wished to make out of wood he would make it and no trouble. Then he said, "I would like to see the man," and he did see him.

Cross-Q. 44. Were you employed under Mr. Horton at the time of this visit to Drawbaugh's?

A. No, sir.

Cross-Q. 45. Was Mr. Horton master-mechanic at the Lochiel Works at the time of his visit, or what was he doing?

A. He was master mechanic of the Johnstown mill, and was on a visit to see his wife.

Re-direct by Mr. Hill:

Q. Q. 46. In your tenth answer, you speak of Horton having left Lochiel, and gone to Wheatland; and, in your forty-fifth answer, you speak of his being master-mechanic at the Johnstown mill, at the time of your visit. Please explain about his being at Wheatland, and at Johnstown.

A. When he left Lochiel, he went to Wheatland to a mill owned by Woods & Co. They failed, and at the time of his visit he was at Johnstown, where he died. He told me he was at Johnstown.

Q. Q. 47. In your fourteenth answer, you stated that Mr. Horton wanted to go to see Drawbaugh, because he had heard a great deal about him in Philadelphia. When did he tell you that he had heard a great deal about him in Philadelphia?

A. Prior to going to Wheatland. He was going to go before, but never got over until he came back.

Q. Q. 48. Going to see Drawbaugh?

A. We often talked about it before he went away. He talked of going to see Drawbaugh.

Q. Q. 49. Was it when you were telling him of Drawbaugh's genius that he told you he had heard about him in Philadelphia?

A. He told me about him often. Then, he at the time asked me if I knew him. I told him that I did, personally.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me this 5th day of May, 1881.
FRED. M. OTT,
Examiner.

DANIEL BALSLEY.

ELIAS Z. GOOD, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Forty-nine, almost. I live in York county, New Cumberland is my post office; I live at New Market. I am making post and rail fences now. My regular trade used to be milling in old times.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania? If so, how long have you know him?

A. I know him, and have known him for a good many years, since 1852, the time I commenced working there in the mill.

Q. 3. In what mill?

A. Eberly's mills.

Q. 4. Did you live at Eberly's Mills then?

A. I hired there. I boarded there, single.

Q. 5. When did you move away from Eberly's Mills?

A. April, 1872.

Q. 6. Where did you move to from there?

A. Right across from New Cumberland about fifty yards from the creek, in Ross' house in York county.

Q. 7. How long did you live in Ross' house?

A. About twenty-two days less than four years. I moved a couple of days before the first of April, 1876.

Q. 8. Where did you move to?

A. To New Market, to my farm, which adjoins Ross'.

Q. 9. You have lived at New Market ever since, have you?

A. Yes, sir; in the same house.

Q. 10. While you lived at Eberly's Mills, were you ever in Daniel Drawbaugh's shop there?

A. Yes, sir.

Q. 11. Did you ever see any talking-machines in Drawbaugh's shop while you lived at Eberly's Mills?

A. Yes, sir; I saw what he called a talking-machine. That is it—just as natural as it was to-day [taking up "F" and "B"]. This is what I remember—this glazing inside the tumbler.

Q. 12. Did you talk through the machines or hear anybody talk through them at that time?

A. No, I did not.

Q. 13. Who showed them to you?

A. Dan Drawbaugh.

Q. 14. After you moved away from there, were you ever back at the shop?

A. Yes, sir.

Q. 15. How many times do you think you were back in the shop after you moved away?

A. Seven or eight times; I can't tell you exactly; seven times anyhow, may be oftener.

Q. 16. What did you go back for after you moved away?

A. For a little bit of money.

Q. 17. From whom?

A. Daniel Drawbaugh.

Q. 18. Was he owing you money when you moved away?

A. Yes, sir.

Q. 19. How much?

A. I think it was five dollars and some cents left due when I moved away. He paid me some on the day I left; I don't mind just exactly.

Q. 20. Has he paid the balance of it?

A. A couple of years after that he paid me part. The balance he paid me this last winter.

Q. 21. Do you know why he didn't pay you before?

A. Because he hadn't the money.

Q. 22. When you were there on any of those dunning visits, after you moved away from Eberly's Mills, did you ever see the talking-machines again?

A. I seen this machine, ["B," and "F"].

Q. 23. Did you ever see any other besides this?

A. I can't say as I did.

Q. 24. Was anybody operating the talking-machines at the time you saw them on your dunning visit?

A. Dan was in the room operating; that is what George told me. I was in another room with George, talking to him. George told me that Dan was operating on the instrument, the talking-machine. That is what George told me.

Q. 25. How long was that after you moved away from Eberly's Mills?

A. I think it was the second year after I left there. I was there on a fishing expedition, along the Yellow Breeches.

Q. 26. George was Dan's brother, was he not?

A. No, sir; Dan was his uncle.

Q. 27. Was George listening at the machine when he said Dan was operating it?

A. I can't tell you that. He was close by it.

Q. 28. Do you remember whether this tin tube "B" was open straight through at the time you saw it, or whether the end of it was closed?

A. It was closed—one end, anyhow.

Q. 29. Have you any recollection what it was closed with?

A. I can't say whether it was bladder or drum-head, or what it was closed with. It was something white and fine.

Q. 30. Do you remember whether the bottom end of this tumbler "F" was broken off when you saw it?

A. I can't say about that right, how that was. It is so long ago that I don't remember that.

Q. 31. Did you have any talk with Dan about it the second time you saw it? I mean the time George was there.

A. No more than he said that he was improving his talking-machine.

Q. 32. At either that time or the first time that you saw it, did Mr. Drawbaugh tell you anything how far about he could talk through it and be heard?

A. I don't know as he made mention of the distance exactly, but he said he could be heard a great many miles, but the miles I disremember.

Cross-examination by Mr. Storrow:

Cross-Q. 33. Where did you last work at milling?

A. At Eberly's Mills.

Cross-Q. 34. What did you do next?

A. Coopering.

Cross-Q. 35. How long did you cooper?

A. Pretty near two years I carried on coopering in that cooper-shop at Eberly's Mills.

Cross-Q. 36. What did you do next?

A. Then I moved down across the creek to York county, and labored for four years.

Cross-Q. 37. Where did you labor, and for whom?

A. Labored some for Ross, some for Musser, Fisher, and some others around there; I couldn't just tell you; wherever there was

IONE COMPANY,-1

anything to do; two years—four years—for the last five years I make fence.

Cross-Q. 38. You made an affidavit about this matter?

A. Yes.

Cross-Q. 39. When?

A. Last winter some time it was; I don't know just the date.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 5th day of May, 1881.
FRED. M. OTT,
Examiner.

ELIAS Z. GOOD.

IRA D. KAHNEY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is thirty-two years; residence is Camp Hill, Cumberland county; my occupation is boss in a stone quarry.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania; and, if so, how long have you known him?

A. I have known him for twenty years.

Q. 3. Have you ever been in his shop at Eberly's Mills and seen any talking-machines there?

A. Yes, sir.

Q. 4. To your best recollection, when did you first see talking-machines there?

A. Between 1871 and 1872.

Q. 5. Did you hear anybody talking through them then?

A. Yes, sir.

Q. 6. Who was it, and who was he talking to?

A. Daniel Drawbaugh talking to me.

Q. 7. Where was he, and where were you at the time—I mean, in what parts of the shop were you?

A. He was in the upper part and I was in the lower.

Q. 8. Did you hear and understand distinctly what he said?

A. Yes, sir.

Q. 9. Were you and he on different floors?

A. Yes, sir.

Q. 10. What kind of instruments were they that he and you were using at that time?

A. It was a kind of a glass tumbler, and a machine fixed up. I couldn't exactly state what it was like.

Q. 11. Please look at the two machines, "B" and "F," now shown you, and state whether you have ever seen them, or either of them, before. If so, when first?

A. They are the first machines I ever seen—they are the machines I referred to.

Q. 12. Do you remember which of them you listened at and which he talked into?

A. I listened at this one ["B"]; he talked into that one ["F"].

Q. 13. From that time down to the summer of 1880, were you occasionally in his shop?

A. Yes, sir.

Q. 14. During every year?

A. Yes, sir.

Q. 15. About how often?

A. Sometimes every day, sometimes every week, and sometimes every month, just as it would suit to get there.

Q. 16. Did you ever see any more talking-machines there?

A. Yes, sir.

Q. 17–18. How often, and down to within what time?

A. I seen them there pretty often, down from 1873 and 1874, and down to a year ago.

Q. 19. Were they the same old machines or new ones?

A. Old ones and new ones together, as much as I seen.

Q. 20. From time to time, as you were there, from 1871 or '2 down to 1880, did you see him working on the talking-machines, or not?

A. Yes, sir.

Q. 21. Did you ever see this machine "J" there? If so, about how long ago, to the best of your recollection?

A. Yes, sir; I couldn't go back more than a couple of years on that.

Q. 22. Did you ever see this machine "H" there; and if so, how long ago?

A. Yes, sir; I seen that machine between 1876 and 1877.

Q. 23. Have you anything to fix the date when you saw that machine "H,"—that tall sloping one?

HONE COMPANY,-1

A. No more than after I came home from the Centennial I was down in the shop one day. I merely looked at it there, the time I come home from the Centennial. That is about all I know of the machine.

Q. 24. To the best of your recollection, about how long after you came home from the Centennial was it that you saw this machine "H?"

A. It may be a couple of months.

Q. 25. Did you ever see this machine "A" there at the shop? If so, about when did you first see it?

A. Yes, sir; I seen it between 1873 and 1874.

Q. 26. Some time in those two years, do you mean?

A. Yes, sir.

Q. 27. Was it put into use?

A. Yes, sir.

Q. 28. Did you hear anybody talking through it. If so, whom?

A. I heard Daniel Drawbaugh talking through it.

Q. 29. Where was he, and where were you, when this machine, "A," was used?

A. He was upstairs, and I was down stairs, in the lower part.

Q. 30. Who was talking?

A. Daniel Drawbaugh.

Q. 31. Who had the machine "A," he or you?

A. I had this machine "A."

Q. 32. Did you hear what he said through the machines?

A. I did at that time, but I couldn't mind any more what he said. I could tell that it was Daniel Drawbaugh speaking, and understand what he said.

Q. 33. Did you, at any time, see there the two small machines, "D" and "E," with the curled magnets?

A. Oh, I may have seen them, but paid no attention to them at all.

Q. 34. Do you recollect anything about them?

A. I have seen them there, but, of course, I couldn't say much about them at all. Don't remember much about them at all.

Q. 35. Is it your recollection that you saw them before or after you first saw the machine "A"?

A. I seen them after I saw that.

Q. 36. What is your best recollection as to how long it was after you first saw "A" before you saw these two, "D" and "E"?

[*Objected to by Mr. Storrow.*]

A. It was a couple of years.

Q. 37. Do you testify to that with certainty, or only as to your best recollection?

[*Objected to by Mr. Storrow.*]

A. To my best recollection.

Q. 38. Please look at the machines now shown you, marked "G," "K," "L," "M," "N," "O," and state whether you ever saw them, or any of them, at Mr. Drawbaugh's shop, and, if so, can you give the time?

A. I may have seen all the machines; but, of course, I couldn't give the times when I seen any of them.

Q. 39. Do you think you saw as many as that, at different times when you were there?

A. I did at some of the times when I was there.

Q. 40. From time to time, as you would go there, did you see new machines that you had not seen before?

A. Yes, sir.

Q. 41. Did you ever hear Mr. Drawbaugh say anything while you were there in the shop about patenting the talking-machine invention?

A. Yes, sir; he told me if he had the means he would get it patented.

Q. 42. Did he ever tell you how far he could talk through the machine and be heard?

A. He told me he could talk the same for miles as he could for a short distance.

Q. 43. Do you remember how the machines were connected when they were used?

A. They were connected with a wire from the top of the shop to the bottom.

Q. 44. Do you remember whether one or two wires?

A. Two wires.

Q. 45. Did you know anything about Mr. Drawbaugh's financial condition along during those years, of which you have testified?

A. Yes, sir; Dan Drawbaugh was poor.

Q. 46. How poor was he?

A. He was so poor that the neighbors wouldn't trust him hardly for anything.

Q. 47. Do you recollect seeing Mr. Drawbaugh working in his shop late at night on the talking-machines at any time or times?

A. Yes, sir.

Q. 48. How often do you remember that occurrence?

A. I hardly know how often. I have been there so often at night that he has been working on them that I would hardly know.

Q. 49. From all you saw of Mr. Drawbaugh and his work, from 1872 down to 1880, what invention would you say that he was principally working on and giving his attention to during all that time?

A. I would say the talking-machine.

Cross-examined by Mr. Storrow:

Cross-Q. 50. What other inventions did he give attention to during that time?

A. He was working at the molasses faucet for one that I know.

Cross-Q. 51. Do you know of any others that he was giving much attention to during that time; and if so, what were they?

A. No, sir; I know of none, for my part.

Cross-Q. 52. When was it that you saw him working at night work—in what years?

A. That is more than I can tell, what years. He used to work most every night. When he used to live at Mechanicsburg, he used to be there, and worked most every night.

Cross-Q. 53. By "there" do you mean at the shop?

A. Yes, sir.

Cross-Q. 54. How did you happen to be there so often nights?

A. Because I live right close there, and I used to go there to pass the evening.

Cross-Q. 55. You have testified that he was poor; do you mean that to apply to all the years from 1872 to 1880?

A. Yes, sir.

Cross-Q. 56. When was it that he told you that if he had the means he would get it patented?

A. That was between 1873 and 1874, as near as I can get at it.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 5th day of May, 1881.
FRED. M. OTT,
Examiner.

IRA D. KAHNEY.

Adjourned until the 6th instant, at 10 o'clock, A. M.

May 6, 10, *A. M.*

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow and Mr. Smith for complainants, and Mr. Hill, Mr. Jacobs, and Mr. Abraham for respondents.

JACOB SHETTEL, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I will be forty-four in the coming fall.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania; and, if so, how long have you known him?

A. I have known him for thirty-five years.

Q. 3. Please look at the machines "B" and "F," now shown you, and state whether you have ever seen them before; if so, when did you first see them?

A. Yes, sir; I have seen them, about nine years ago.

Q. 4. How did you happen to see them at that time?

A. I went down to Mr. Drawbaugh's shop, and in the room in the shop he had those machines on a bench. He showed them to me and told me it was a talking-machine; that he was experimenting with them. He had, at that time, a skin or bladder of some kind across the end of it—of "B"—next to the coil of wire, and on that head, or skin, he had a bar of iron across about three eighths or one half an inch wide, reaching about two thirds across the head. Then he had, with this coil of wire, [indicating the electro-magnet of "B,"] two wires connecting with this; one wire leading from the coil or electro-magnet to the tumbler with the mouthpiece on [indicating "F;"] another connected to the same piece leading to another tumbler, which he called his battery, with some solution of a liquid kind in, and a wire from the battery to the electro-magnet. That, he said, formed a circuit of the battery, by means of which he could talk. He didn't talk through it to me, as the skin or bladder was torn or bursted loose about an inch along the edge of this cylinder of tin, which, he said, prevented his using it. But, he said at the same time, if he had a wire from the shop in connection with the telegraph wires at White Hill, that he could talk to Mechanicsburg by having a machine there, or an instrument in the office. He also said it would be better than telegraphing, and that it would be worth a great deal of money. I don't remember that he said anything more at that time.

Q. 5. Referring to the bar of iron that was attached to the skin or bladder on the end of the tin cylinder, do you remember how or in what direction that extended? If so, please indicate.

A. Right horizontally; directly in front of the electro-magnet, very nigh touching it.

Q. 6. State what you remember as to the construction of the tumbler instrument, "F," and whether you looked into its interior, or not.

A. I seen a piece of tin he had over the mouth of the tumbler, right across underneath the mouth-piece. I did not look into the glass below. I could not see in on account of the tin. The bottom of the tumbler was not broken out. The tumbler seemed to be coated with white material on the inside. I didn't ask him, nor did he tell me what it was.

Q. 7. How do you fix the time of that interview as being about nine years ago?

A. I paid a visit to an uncle of mine living in that place within two years after I was married. I was married eleven years ago last January.

Q. 8. Did you know about the Haucks purchasing and commencing to carry on the faucet business at that shop?

A. Yes, sir.

Q. 9. Was the interview which you have described before or after the Haucks assumed control of the faucet business?

A. Before.

Q. 10. What business was going on at the shop, if any, at the time of that interview?

A. Not any business.

Q. 11. Do you recollect whether, prior to the time of that interview, the old faucet company had been carrying on business at that shop?

A. Yes, sir; they had been manufacturing faucets.

Q. 12. Did you see any faucets lying around there at the time of the interview which had been made before?

A. Yes, sir; I seen a few lying around the shop.

Q. 13. Were you a member of the company which undertook, a few years ago, to manufacture the Drawbaugh electric clock at that shop?

A. Yes, sir; I was.

Q. 14. At what time did that electric clock company go into operation or commenced its business?

A. The first of April, 1878.

Q. 15. Did you, or not, take a pretty active part in starting that company, and arranging the preliminary negotiations with Mr. Drawbaugh therefor?

A. Yes, sir; I did.

Q. 16. For what length of time, prior to starting up the clock company, were you looking into the matter and talking to Mr. Drawbaugh about it?

A. About one year; I had first spoken to him about it, or he to me.

Q. 17. During that one year, prior to starting up the company, were you, or were you not, frequently at his shop?

A. Yes, sir; I was.

Q. 18. Please look at the instrument now shown you marked "H," and state whether you ever saw it before, and, if so, when you first saw it, to the best of your recollection.

A. I saw it early in the spring of 1877.

Q. 19. Was it, or was it not, there at Mr. Drawbaugh's shop, at or prior to the time when you first began to investigate the electric clock business with a view to going into it?

A. Yes, sir; it was there in the spring of 1877; the year before we went into the clock business, I saw it.

Q. 20. Did you hear any conversation through it at that time?

A. Not any conversation. He rang the bell attached to it; that is all he did to it.

Q. 21. Did he tell you what it was for?

A. Yes, sir; he told me what it could be used for, for giving alarms and calling at rooms of hotels.

Q. 22. Did he tell you what the machine "H" was—what name did he give it?

A. I don't remember that he gave it any name.

Q. 23. Did he speak about its being a talking-machine, or not?

[*Objected to by Mr. Storrow as leading, and as an attempt to obtain an answer from the witness on a subject on which his memory has been exhausted.*]

A. I don't remember that he said anything about its being a talking-machine.

Q. 24. Did you understand, at the time, whether it was a talking-machine, or not?

[*Same objection, and also that the question is not competent.*]

A. I don't know that I did. There was very little explanation of that instrument that he gave to me at that time.

IONE COMPANY,-1

Q. 25. Please look at the two machines, "D" and "E," now shown you, and state whether you ever saw them before. If so, about when you first saw them, to the best of your recollection?

A. I saw them about the year 1875.

Q. 26. Who showed them to you, and where?

A. Mr. Drawbaugh showed them to me in his shop.

Q. 27. Please look at the instrument "A" now shown you, and state whether you ever saw it before; and if so, state whether you first saw it before or after you first saw the instruments "D" and "E."

A. Yes, sir; I saw it some time before I first saw those two smaller ones ["D" and "E;"] how long before I can't say.

Q. 28. Who showed it to you, and where?

A. Mr. Drawbaugh showed it to me in his shop.

Q. 29. Did you hear anybody talking through it, or see anybody listening at it?

A. Mr. Drawbaugh talked into it, or showed me how he adjusted it, as he called it, to make sounds or receive words through it. He screwed it up, using his breath or the power of his voice, and making it buzz like a bee.

Q. 30. How often were you in Mr. Drawbaugh's shop, to the best of your recollection, between 1872 and the spring of 1878?

A. I was there a number of times, just how often I couldn't say.

Q. 31. As you would be there from time to time, during that period, did you, or did you not, see him working upon his talking-machines, or hear him talk about them?

A. He spoke to me at different times about them. I don't know that I seen him directly working upon them.

Q. 32. What would he say about them from time to time during that period?

A. He was improving them—getting them that he could talk plainly through them and be understood plainly.

Q. 33. About when did he tell you this—at any particular time, or all along during the time?

A. Along during the time when I was there.

Q. 34. Please look at the instrument "C" and state whether you ever saw that at Mr. Drawbaugh's shop. If so, when?

A. Yes, sir; saw this at the time I saw the first one ["B" and "F"].

Q. 35. State whether or not you saw other talking-machines there along during that time, from 1872 to 1878, besides these instruments "A," "B," "C," "D," "E," "F," and "H."

A. Nothing else. That is all I saw.

Q. 36. State whether, at any time during that period, there was any conversation between you and Mr. Drawbaugh about patenting the talking-machine, or as to why he did not patent it at the time.

A. I don't remember of any conversation between us as regards patenting.

Q. 37. How long did the electric clock company continue its business after the first of April, 1878?

A. About one year.

Q. 38. Was its business financially successful, or did it result in a loss to the company?

A. It was not successful, as we expected it would be.

Q. 39. Was Daniel Drawbaugh in the employ of the electric clock company during that year?

A. Yes, sir; he was.

Q. 40. Was he paid anything by the company at the time it went into operation for the privilege of using his electric clock invention? If so, how much?

A. Yes, sir; we paid him on the first day of April, 1878, five hundred dollars.

Q. 41. During the year that he was employed by the electric clock company, was he employed on wages?

A. Yes, sir; he was.

Q. 42. Did the company pay him any wages for his year's work?

A. No, sir.

Q. 43. Why not?

A. Because there was an understanding, as we had thought, in the company, that he was to receive his wages out of the proceeds or profits, and there being none, he never got any wages.

Q. 44. Do you know what he did with the five hundred dollars that the company paid him on the first of April, 1878?

A. He told me that he paid three hundred dollars of it on a judgment on his house.

Q. 45. When did he tell you that?

A. He told me that about a week or ten days after we had paid him—after the first of April, and at that time he said he didn't have five dollars out of the whole of it.

HONE COMPANY,-1

Q. 46. You mean out of the whole five hundred dollars?

A. Yes, sir.

Q. 47. Do you know whether he was in debt a good deal, or not, at that time?

A. Yes, sir; he told me that he owed considerable.

Q. 48. Do you know what his financial condition was during the year 1878? If so, what was it?

A. Yes, sir; it was pretty poor. He told me that he didn't have any money to get what he really should have for his family.

Q. 49. When did he tell you that?

A. Along during the year 1878.

Q. 50. State any other facts that you remember bearing on the subject of his poverty during that year.

A. We came to Harrisburg at various times during that summer, and he didn't have the money to pay his toll—five cents—across the bridge, and I paid it for him different times; and, also, he didn't have money to buy tobacco for himself, and I bought that for him several times; and I several times gave him a dollar, when we were over here, to buy groceries for his family.

Q. 51. During the year that your company was working there at the electric clock business, do you know whether or not he was in the habit of working in the shop late at night, after business hours were over?

A. Yes, sir; he told me, at different times, he was working up as late as two o'clock in the morning.

Q. 52. What was he so working at?

A. That I couldn't say. I never saw the instruments or material that he was working at in the night time, nor he didn't tell me what he was working at.

Q. 53. Do you know whether he was working at the business of the company during those nights?

A. No, sir; he was not doing anything for the company.

Q. 54. Do you recollect whether there was, during that year, any dissatisfaction expressed by the members of that company, or any of them, by reason of their belief that Mr. Drawbaugh's attention and mind were given to something else more than to the company's work?

[*Objected to by Mr. Storrow as leading and as assuming.*]

A. Yes, sir; there was. They seemed to think that he could make no headway at all in the clock; that his mind was entirely taken up with something else, and that he could make no progress, and that was my reason for selling out of it.

Q. 55. From all you know of what was going on, did you, at the time, suspect or believe what that something else was to which his mind was given?

A. At the close of the year, or nearly the close of the year, we did suspect that it was his talking-machine that he was working upon, yet he didn't tell us.

Q. 55½. When you were contemplating getting up the electric clock company, during the time from the spring of 1877 to the spring of 1878, knowing, as you did, about his telephone or talking-machine, why did you not go to work to organize a company upon that invention instead of the electric clock?

A. According to my own judgment or knowledge of his talking-machine, I did not think that there was half the value in that that there was in the clock. For that reason we took hold of the clock, there being a considerable excitement in the neighborhood about the clock. That made us think there was considerable value in it.

Q. 56. Am I to understand you that it was your judgment and belief that there was more money in a clock that would run without winding up than in a machine by which a man could talk from one place to another?

[*Objected to by Mr. Storrow, as leading, as argumentative, as assuming a state of facts not shown by the evidence, and as tending to induce the witness to vary the testimony already given.*]

A. Yes, sir; I thought there was more money in the clock.

Q. 57. Prior to the time when you got up the clock company, Mr. Drawbaugh had told you, as you have testified, that he could talk through his machine, and be heard as far as Mechanicsburg. Did you, or did you not, believe that statement to be true when you went into the clock business?

[*Objected to by Mr. Storrow, on the ground that proof of the witness's credulity is not competent evidence to sustain any issue raised by the defendant's answer.*]

A. Yes, sir; I did; but I never considered the talking-machine; my mind was taken with the clock.

Q. 58. In your fifty-fifth answer, you refer to there being considerable excitement in the neighborhood about the clock before you got up the clock company. Please explain more fully what you mean by that.

A. Persons were all over the neighborhood talking about the clock, thinking that it was a great invention, and that it would be worth a large amount of money.

Q. 59. Was the popular excitement greater at that time about the clock than about the talking-machine?

A. Yes, sir.

Recess for dinner.

---

2 o'clock, P. M.

Examination resumed.

Present, same counsel.

Q. 60. When did you first see an electric clock in Mr. Drawbaugh's shop?

A. I think about 1871 or '2, or along there, was the first I saw the skeleton hanging against a board running in his room in his shop.

Q. 61. In your conversations with Mr. Drawbaugh, prior to getting up the clock company, did you, or not, manifest to him that your interest was in the clock rather than in any other of his inventions?

A. Yes, sir; I thought it best of all that he had invented yet.

Q. 62. Who were in the clock company besides yourself?

A. Jacob H. Grissinger and Theodore Grissinger, Daniel Drawbaugh, and myself.

Q. 63. Were the two Grissingers connections of yours? If so, what?

A. Yes, sir; brothers-in-law.

Q. 64. What was their regular business?

A. Jacob you might call a farmer; Theodore was in the agricultural implement business.

Q. 65. Where did they live?

A. Jacob lived at Shepherdstown, about five miles from Eberly's Mills, and Theodore lived at Mechanicsburg.

Q. 66. Do you know how the two Grissingers came to go into the electric clock business?

A. Yes, sir; as much as I know, by my influence.

Q. 67. Do you know what Mr. Drawbaugh's pecuniary condition was for eight or nine years prior to 1878—say from 1869 or '70 down to 1878?

A. As much as I know, poor.

Q. 68. How far was White Hill station from Eberly's Mills?

A. From a mile and a half to two miles.

Q. 69. How far from White Hill station to Mechanicsburg?

A. Between six and seven miles.

Q. 70. Prior to your getting up the electric clock company, did Mr. Drawbaugh ever say anything to you about desiring to get somebody to take hold with him, to help him to bring out his inventions, or any of them?

A. I don't know that he has, more than in the clock business, but he has made the remark to me, that if he had the means to go ahead himself with them, he could make more out of them.

Q. 71. Did you ever talk to him, prior to the establishment of the clock company, about going in with him on any other invention than the clock?

A. No, sir; not to my recollection.

Cross-examined by Mr. Storrow:

Cross-Q. 72. How old were you when you first knew Drawbaugh?

A. About eight years, between eight and nine years. I knew him since I know anybody.

Cross-Q. 73. Have you known him well ever since?

A. Yes, sir; very well ever since.

Cross-Q. 74. Has his character and behavior been such that you have uniformly respected him and liked him?

A. Yes, sir.

Cross-Q. 75. Where did you and he live when you first knew him?

A. When I first knew him, we lived in the same place, Eberly's Mills.

Cross-Q. 76. Did he have his shop there then?

A. No, sir; he had no shop there then. The shop was standing that is used as his shop now. It was at that time a clover-mill, for hulling-clover seed.

Cross-Q. 77. When did he begin to have a shop there?

A. I can hardly tell the exact time since he has had his shop. As far back as 1867, I know he had his shop there, manufacturing faucets.

Cross-Q. 78. When you moved away from Eberly's Mills, where did you go to?

A. We moved about eight miles from that place, along the Conadoguinet creek, on a farm owned by Orris, in East Pennsboro' township, Cumberland county.

Cross-Q. 79. When did you move there and when did you move away from there?

A. We moved there about thirty-nine years ago. We lived there six years, and we moved away about thirty-three years ago.

Cross-Q. 80. Where did you go to then?

A. We moved on the farm owned by Mr Merkel, near the village of Shiremanstown.

Cross-Q. 81. About how long did you live there, and where did you then go to?

A. We lived there seventeen years. Then father bought a farm near the village of Shepherdstown, and we moved up there.

Cross-Q. 82. How long did you live there, and where did you go to next?

A. It is thirteen years since father moved there. I had been only two years with him there when I got married and went for myself. I am now living near the village of Shepherdstown, and have been ever since I was married.

Cross-Q. 83. How old were you when you moved away from Eberly's Mills?

A. About five years, I think.

Cross-Q. 84. What has been your business the last ten years, besides farming?

A. The one year that we were in the clock business, and about the last ten years have been in the threshing business, running a steam separator in the latter part of the summer.

Cross-Q. 85. Do you own the steam thresher yourself?

A. Yes, sir.

Cross Q. 86. You have been in the habit of going to Drawbaugh's shop the last fifteen years, or of meeting him?

A. Yes, sir; I have occasionally been in the habit of going down, during this time, to his shop; seldom ever met him away from the shop.

Cross-Q. 87. You spoke in your testimony of his other inventions; what other inventions do you understand he has made?

A. There are different inventions that he has made. There are two faucets that he has invented; a water-motor and a number of other machines that he has made, such as a stave-cutter and stave.jointer. The clock was, too; can't just think of any others now.

Cross-Q. 88. Why were the negotiations about the clock business so long that they extended over a year?

A. For the reason that I did not feel myself able to put in the amount of money that he wanted paid down, and Mr. Grissinger would not consent for a time to go in with me.

Cross-Q. 89. How much did he want to have paid down when you first began the negotiations?

A. He wanted us first to pay him a thousand dollars, then afterwards he agreed to take five hundred.

Cross-Q. 90. Was he to have some more paid him afterwards? If so, how much more, and when was it to be paid?

A. He was to receive the one fourth, with the additional eight per cent. to that on the profits.

Cross-Q. 91. Was not he also to receive five hundred dollars out of the profits?

A. Yes, sir; I believe he was to receive five hundred additional out of the profits, making him the thousand then.

Cross-Q. 92. I suppose that you and the two Grissingers paid the five hundred dollars cash which he received, didn't you?

A. Yes, sir; we paid him that cash on the first day of April, 1878.

Cross-Q. 93. Tell me what clocks of his invention you saw before you made the payment.

A. I saw the one which now stands in Mr. Chellis' store, behind the door, and there is one hanging over in the shop that was made then.

Cross-Q. 94. Were those all the clocks of his you saw before you made the payment in April, 1878?

A. All that were finished. He had a skeleton, his first invention of it. I saw that a good while ago, ten or twelve years ago, somewhere along there.

Cross-Q. 95. What electric clocks did you see running at his shop, during that year of negotiation?

A. There was one running there, controlled by a large, eight-day clock.

Cross-Q. 96. Was the eight-day clock run by a weight, or spring, or was that itself run by electricity?

A. That was run by a weight.

Cross-Q. 97. Then the electricity was only to enable the eight-day clock to control the other; is that right?

A. The large clock was run by a weight, and, in some way, he had wires connecting the large clock from the bottom, and to the other clock that was controlled by it. I never examined particularly how he had it connected.

Cross-Q. 98. The invention which you bought, then, was the principle of having one clock control another by having them connected, by wire, with an electric battery, was it?

A. No, sir; the principle was to be controlled by a battery from the earth by itself.

Cross-Q. 99. Do you mean so that all the clocks should run without any driving springs or weights in any of them?

A. All those that were to be magnetic clocks were to be run without springs or weights.

Cross-Q. 100. They were to be run by magnetism, which they took up from the earth—is that it?

Q. Yes, sir; electricity obtained from the earth.

Cross-Q. 101. How many clocks of his, running on that principle, did you see before you paid him the five hundred dollars?

A. Two; one in Mechanicsburg, at Mr. Shapley's, and one in the shop.

Cross-Q. 102. Were those two in addition to the clocks you previously mentioned?

A. No, sir; the one is. I disremembered the one at Shapley's; the one in the shop is the one I mentioned.

Cross-Q. 103. In your ninety-third answer, you speak of two clocks, one of which now stands in Mr. E. W. Chellis' store, and one of which now hangs over in the shop; were these the clocks that you have just referred to as running by electricity from the earth, and made before April, 1878?

A. No, sir; not the two. The one that is now in the shop was then running by electricity from the earth; the one in Mr. Chellis' store was not running.

Cross-Q. 104. Was the Chellis clock built then, and where did you see it before April, 1878?

A. Yes, sir; it was built and finished, standing in the shop there, all except the electro-magnet.

Cross-Q. 105. Now, I wish you would enumerate all the clocks of his invention that you saw before April, 1878, that employed electricity in any way, including those that were connected with another clock and a battery, as well as those that ran, or were intended to run, by electricity obtained from the earth?

A. There were four, including the skeleton of his first invention—his experimenting works.

Cross-Q. 106. Please state where each of them were when you saw them during that year of negotiation, and give some description of each of them.

A. The one was at Shapley's room at Mechanicsburg, the other one is the one that is in the shop now, and was at that time; that was run by electricity of the earth. One was in the shop at the beginning of the year that was controlled by the eight-day clock. This skeleton that had been running when I first saw it was not up at that time.

Cross-Q. 107. Which of those four clocks ran, or was intended to run, by electricity from the earth?

A. The one at Mr. Shapley's. The skeleton works that had been up ran by electricity from the earth, and the one that is hanging in the shop at the present time.

Cross-Q. 108. Which of those four is the one that is now at Mr. Chellis'?

A. Not any of them.

Cross-Q. 109. Then, am I to understand that the Chellis clock was a fifth clock, which you saw completed in the shop before 1878, but which had not been started at that time?

A. No, sir; it was not the fifth clock. I did not understand that the one hundred and fifth question included clocks that were not running.

Cross-Q. 110. In your one hundred and sixth answer, you refer to four clocks beside the eight-day clock. Did you see the Chellis clock completed before 1878, and was it one of those described in your one hundred and sixth answer, or was it an additional one?

A. The Chellis clock was additional to those four. It was not described by that answer, but it was not running.

Cross-Q. 111. Were there any clocks of his invention that you saw before April, 1878, in addition to those described in your one hundred and sixth and one hundred and tenth answers?

A. No, sir; there were no others that I saw.

Cross-Q. 112. In what year was the Shapley clock built?

A. I don't know that I can exactly tell you when that was built; in 1876, or 1877—it may have been built in 1875; that is as near as I can remember.

Cross-Q. 113. When did you first see it?

HONE COMPANY,-1

A. I believe it was about the beginning of 1876 that I first saw that one at Mr. Shapley's.

Cross-Q. 114. When was the Chellis clock built?

A. In the after part of the winter of 1877.

Cross-Q. 115. When was the clock that is now in the shop built?

A. I couldn't remember when that was built—after the skeleton; 1874, or 1875, along there.

Cross-Q. 116. When did he build the clock that was controlled by the eight-day clock?

A. That I can't tell you, when he built that one. It is ten or eleven years since I first seen it in motion.

Cross-Q. 117. Was the Shapley clock ever at Drawbaugh's shop running?

A. No, sir; I think it was not.

Cross-Q. 118. Was it ever there at all?

A. The case was not, but the works Dan made there at the shop—so he told me.

Cross-Q. 119. When did you first see the works of the Shapley clock at Dan's shop?

A. I never saw them at all there at Dan's shop.

Cross-Q. 120. Did your company apply for or take out any patents on the inventions you bought of Drawbaugh?

A. Yes, sir; made applications for patents, and, I think, received one upon the ground battery. Others were not granted while I was in the company.

Cross-Q. 121. How many clocks did your company manufacture?

A. We only completed two, and put up the case of another one and part of the works.

Cross-Q. 122. Where were they made?

A. Over in Drawbaugh's shop.

Cross-Q. 123. Did your company buy, or have made for them, any of the tools or machinery to make any of these clocks with?

A. Yes, sir; we bought several small lathes and a few other tools.

Cross-Q. 124. Did you get up a gear-cutter for them?

A. No, sir; I believe he had a gear-cutter of his own at the time.

Cross-Q. 125. One of his own make, or one that he had bought?

A. I am not positively certain as to that. It appears to me one of his own make.

Cross-Q. 126. When did your company sell out and to whom?

A. I sold out in the spring of 1879. The Grissingers held their interest a year later, when they sold to E. W. Chellis. I sold to Mr. Jacobs, and he sold to Chellis.

Cross-Q. 127. Why did you sell out?

A. Because we couldn't get the thing to move on as we would have liked, or make any headway.

Cross-Q. 128. You spoke of a faucet company that made faucets at his shop some time before 1870. Did that company continue up to the present time, or did they stop manufacturing?

A. They stopped manufacturing, I think, somewhere about 1870 or 1871.

Cross-Q. 129. Were their remains afterwards sold out to anybody; and, if so, to whom, and when?

A. Yes, sir; at least, the greater portion of them, so far as I know were sold to the Haucks, I think about the beginning of 1873, as near as I can recollect.

Cross-Q. 130. Did the Haucks begin to manufacture Drawbaugh's faucets at his shop; and, if so, how long did they continue?

A. Yes, sir; I think they manufactured, or continued there, about one year.

Cross-Q. 131. What was the next manufacturing business done there?

A. Kline's axle-tree company were manufacturing there.

Cross-Q. 132. How long did they continue?

A. I believe they were about a year, or a little over, at work.

Cross-Q. 133. Did the Haucks make much money, manufacturing those faucets there?

A. That is more than I can say. I don't know.

Cross-Q. 134. I suppose you only know that they worked there for a year and then stopped. Is that all you know about that business?

A. That is about all I know.

Cross-Q. 135. Has a different faucet, invented by Drawbaugh, ever been manufactured there since?

A. I guess they are manufacturing, at the present time, a different faucet there; I am not positive about that.

Cross-Q. 136. Who is doing it?

A. E. W. Chellis and Mr. Drawbaugh.

Cross-Q. 137. When did Mr. Chellis begin this faucet business with Mr. Drawbaugh?

A. He went in as a partner with him several years ago.

HONE COMPANY,-1

Cross-Q. 138. Are these talking-machine instruments, that you have testified about, in the same condition now that they were then?

A. No, sir; they are not.

Cross-Q. 139. Please state the difference in each of them between the condition they were in when you first saw them and the condition they are now in.

A. This one marked "F," the bottom was in it then, and it had a tin plate over the top of the tumbler underneath this mouth-piece, that is not in it now. This here one marked "B" was lined with some substance on the inside of the cylinder. I see a small portion of it now. The remainder has broken loose, that had been all solid when I first saw it. It also had a bladder or skin of some kind that closed the end, and a small iron bar parallel across the end about the middle of it, three eighths or one half inch wide, reaching about two thirds across the head, which is not here now. Then it was also with wires connected to the tumbler "F," and the battery, which is not connected now. That is about the difference in condition from that time to this, that I can give. Those [indicating "A," "D," and "E"] are in about the same condition now that they were in when I first saw them; this [indicating "C"] is about in the same condition as when I saw it. This [indicating "H"] is about the same, as near as I can recollect.

Cross-Q. 140. I suppose you saw the inside of these instruments, "A," "C," "D," "E," and "H," the first time you saw them, didn't you, so as to know that the working parts are the same now that they were then? And that you remember what the insides were then?

A. No, sir; I didn't neither see the insides then nor now, but the condition, as near as I can remember, was the same then as it is now.

Cross-Q. 141. Did you see these instruments during the year that you were negotiating about the clock, and during the year that your company were at work at Drawbaugh's shop?

A. Yes, sir; I seen all of them during that time.

Cross-Q. 142. Did you see them often?

A. No, sir; I did not see them often, as I was not paying much attention to them, but thinking of clocks.

Cross-Q. 143. Were you there often during those two years?

A. Yes, sir; I was there a number of times during the year 1877, and, during the fore part of the summer of 1878, I was there pretty nearly every day some weeks.

AMERICAN BELL TELEPHON

Cross-Q. 144. How many times had you seen "F" and "B" before 1877?

A. I am not able to say how often, but I saw them quite a number of times.

Cross-Q. 145. When did you first notice that the bottom had been broken off of the glass tumbler "F?"

A. I don't remember when I noticed that first; perhaps several years ago.

Cross-Q. 146. Was it about the time you began to go there negotiating for the clock?

A. I believe it was off at that time.

Cross-Q. 147. And that is about the first time you saw it off, isn't it?

A. As near as I can recollect. I don't remember; I was not paying any attention to it.

Cross-Q. 148. You paid enough attention to it to be able to testify about the tin plate and connections which you have described, I suppose?

A. Yes, sir; but I remember that from the first time seeing it, which the bottom was not off then.

Cross-Q. 149. During the year 1877, did Drawbaugh speak with you about his talking-machine?

A. .He did speak to me something about his talking-machine that he was experimenting with. He gave me no full particulars, though.

Cross-Q. 150. Did he, during that year, ask you to take an interest with him and furnish money to take out a patent on it?

A. No, sir; he did not. If he should have, I should not have taken it, for I did not think there was much in it.

Cross-Q. 151. What was it, in 1878, that led you to think Drawbaugh was spending his nights on the talking-machine?

A. For the reason that he made a few remarks toward the close of the year 1878, and told us, still, that he was working up as late as two o'clock at night, and we knew he was not working for the company, which led us to think he was working on that.

Cross-Q. 152. You have testified that you and your partners, or you, thought that he was not doing that justice to the company that he ought to, and, therefore, sold out. What led you to think so?

A. For the reason that we could not make no progress at all in the clock, and we, therefore, sold out. He seemed to be all the time studying at something in his head.

Cross-Q. 153. You have testified about his extreme poverty in 1878. Don't you think you have rather over-stated his poverty?

A. No, sir; not if I dare believe his own words.

Cross-Q. 154. You have testified that he was a friend of yours, and was so very poor in 1878, and that you let him work for your company that year and paid him no wages. Don't you think you have rather overstated the friendship, if he really was as poor as you say?

A. I don't know that I have. I think he is just as good a friend of mine to-day as he was in 1878 and before. And we, as al others in business, having a contract as we thought, think it right to live to that contract. And he, not alone in 1878, was poor, but before that was just as poor as in 1878.

Cross-Q. 155. You made a bargain with him to work for your company, may be for a year, and he was not to receive anything for wages, unless profits came at the end Do you think it was the act of an old friend to make such a bargain and expect him to live under it, if he was as poor as you say he was?

[*Objected to by Mr. Hill as improper, incompetent, and immaterial, and assuming to state the terms of the contract differently from what has been proved.*]

A. Yes, sir; when I make a bargain or contract, I always expect to live up to it, and I think it is perfectly right that everybody else should.

Cross-Q. 156. If he was as poor as you say, how did you suppose he was going to live at all and support his family under such a contract?

A. Just as he did before he made that contract, by working many days for nothing, and depending upon his creditors to give him as they had been giving him before; but if he had asked me for the loan of twenty-five or fifty dollars, I should have done it; but he never asked me for the loan of any money, with the exception of several dollars that I gave him at times, here in Harrisburg, when we were over.

Cross-Q. 157. Do you mean that it was your expectation, knowing, as you say, how poor he was, that he would work for you, and live on his creditors; and that you would leave them to stand it, and not pay anything yourself, unless it came out of the profits of the business?

A. I didn't expect him to live on anybody; and I never pay anything unless I am asked for it.

Re-direct by Mr. Abraham:

Q. Q. 158. Did you and your associates, including Mr. Drawbaugh, not go into the clock company with the expectation of making a profit out of it?

A. Yes, sir; we went in with the expectation of making a considerable amount of money during the first year, which we were badly disappointed in.

Q. Q. 159. Then you expected that Mr. Drawbaugh would be compensated for his wages out of his share of the profits of this enterprise, if I understand you correctly?

A. Yes, sir; we expected the profits to pay his wages, out of his share of them. That was the understanding.

Q. Q. 160. Were you authorized at any time to expend any of the funds of this clock company to gratify your friendly feeling to any one, or were you limited to apply it to the actual debts of the company?

A. All money was to be applied to the debts of the company, not spent on friends; but we never had the opportunity to expend much in either way.

Q. Q. 161. Do you recollect the date when you last saw that clock at Mr. Shapley's, in Mechanicsburg?

A. I don't think I saw it later than the fore part of the summer of 1878.

Q. Q. 162. In your cross-answers 151 and 152, you speak of your coming to the conclusion, towards the close of 1878, that Mr. Drawbaugh was working at nights on the talking-machine, and of the fact that he seemed to be all the time studying at something. State whether you had or had not noticed, before the latter part of 1878, that his mind seemed to be dwelling or studying upon something else besides the clock business.

A. I don't know that I did pay any attention to it before. At that time, he made a remark about working at night, and that made me think so.

Re-cross by Mr. Storrow:

Re-Cross-Q. 163. In 1878, Drawbaugh was getting up a new faucet and trying to get people to go into that with him, was not he?

IONE COMPANY,-1

A. As for that part, I could not say. He had models for that last faucet several years previous to that time, and I saw them.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to this sixth day of May, 1881, before me.
FRED. M. OTT,
Examiner.

JACOB E. SHETTEL.

Adjourned to May 7, 1881, at 10 o'clock, A. M.

May 7, 1881, 10 *o'clock, A. M.*

Examination resumed, pursuant to adjournment.

Present, Mr. Smith for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

W. M. LORY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Am going on fifty-one; reside in Latimore township, Adams county, Pennsylvania. I am a carriage-maker by trade.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania; and, if so, how long have you known him?

A. I have known him for about seventeen years now, as near as I can state.

Q. 3. Did you ever hear him say anything about being at work trying to get up a machine or invention for talking to a distance? If so, what did he say, and when was it that you first heard him speak about it?

A. Yes, sir; it was in the fall of 1864. He told me that he was about making a machine to talk through a distance of about twenty miles. He showed me a draft of it on paper.

Q. 4. Did he tell you, or try to give you any idea as to how the machine would work?

A. Yes, sir.

Q. 5. On what principle did you understand him, that he expected it to work?

A. I thought that it was to be a kind of a trumpet. I couldn't get no sense out of it.

Q. 6. Did he say anything about its being like or unlike the telegraph? If so, state what he said.

A. He said it would work something like the telegraph, but you would have to talk into it—not blow in it. I thought it was to be a trumpet, as before stated.

Q. 7. You did not understand the invention, that he was speaking about, did you?

A. No, sir.

Q. 8. What did you think about the matter, when he spoke of talking twenty miles?

A. I thought that Mr. Drawbaugh had turned out to be a fool.

Q. 9. Did you understand him that he had invented the machine, or that he was trying to invent the machine, at that time?

A. I understood him that he had it invented and the plans made, but he was going to make the machine.

Q. 10. What kind of a drawing was it that he showed you—one he had made before, or one that he made at the time to aid in explaining it to you?

A. He had a drawing made on paper.

Q. 11. Did you examine the drawing pretty carefully?

A. Yes, sir.

Q. 12. Have you in your memory still an idea of that drawing—how it looked?

A. Yes, sir.

Q. 13. Please take a sheet of paper and make a rough drawing, as near like that as you can remember.

A. That is it, sir, [handing examiner a drawing, which Mr. Hill puts in evidence as "exhibit-Lory" of this date.]

Q. 14. What idea did you get about this part of the drawing that I mark "A," as to what it was?

A. It was hollow inside.

Q. 15. The same question as to this thing here, which I mark "B," "B," "B," "B," "B?"

A. It was to be a bench or table where this machine was to set on.

Q. 16. The same question as to the two lines, which I mark "C," "C?"

A. He said they were wires that ran into this machine.

Q. 17. The same question as to the part that I mark "D?"

PHONE COMPANY,-1

A. He said that was something like a cup; an opening where you talked into.

Q. 18. How do you fix the time as being in the fall of 1864?

A. Mr. Eberly had a buggy wheel broken, and I had occasion then to go down to the mill to see about it, where Mr. Eberly's office was. Then I went once to Mr. Drawbaugh's from Mr. Eberly's office. Mr. Eberly wanted me to come down to see about fixing the buggy wheel. That was my business.

Q. 19. What Eberly?

A. Mr. Christian Eberly.

Q. 20. Where were you living at that time?

A. I was living in Mr. Eberly's house at Eberly's Mills.

Q. 21. How long after that did you live in Mr. Eberly's house?

A. Not long; I moved away that fall.

Q. 22. Where did you move to?

A. To Shiremanstown.

Q. 23. Did you ever reside at Eberly's Mills afterwards?

A. No, sir.

Q. 24. I am to understand that that conversation with Mr. Drawbaugh was in Drawbaugh's shop?

A. Yes, sir.

Q. 25. State whether or not you have ever been in Mr. Drawbaugh's shop since the fall when that conversation took place?

A. No, sir; I never have.

Cross-examination waived by Mr. Smith.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 7th day of May, 1881.
FRED. M. OTT,
Examiner.

W. M. LORY.

SAMUEL NICHOLS, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am not quite fifty-one yet; I reside at White Hill, Cumberland county, Pennsylvania; I am a civil engineer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, and if so, how long have you known him?

A. Yes, sir; I have known him, I suppose, about twenty-five years, at least.

Q. 3. How long have you lived at White Hill station?

A. I have lived there thirteen years. I moved there about the middle of March, 1868.

Q. 4. Since you lived at White Hill, have you ever seen Mr. Drawbaugh's talking-machines? If so, when and where did you first see them?

A. Yes, sir; I saw it at Milltown, in the mill. He showed it to me about the second summer after I moved there to White Hill. It was in the old clover-mill—formerly called—where the shop is now.

Q. 5. Was anybody present? If so, how many and who, when you first saw the talking-machine?

A. Yes, sir; my son-in-law, Samuel Bruce, was along with me at the time, and there was others there, but I could not recollect who they were at present.

Q. 6. Were the talking-machines operated during that visit?

A. Yes, sir.

Q. 7. Who operated them?

A. Mr. Drawbaugh.

Q. 8. When he was talking into the machine, who listened?

A. My son-in-law listened in the first place. Mr. Drawbaugh spoke through it, and my son-in-law said he heard it very distinctly. Then he spoke through again, and I listened, and I heard it very distinct.

Q. 9. Did you hear and understand what he said when he spoke through it and you listened

A. Yes, sir.

Q. 10. When Drawbaugh spoke, and Mr. Bruce and you listened, where was Mr. Drawbaugh, and where were you and Mr. Bruce?

A. Mr. Drawbaugh was in the regular shop department. There was then an open space between that, and then there was a little drawing room in which Mr. Bruce and I were.

Q. 11. Do you mean that Mr. Drawbaugh was in one room, you and Mr. Bruce in another room, and that there was an open space between the two rooms?

A. Yes, sir.

Q. 12. You say there were several parties there besides Mr. Drawbaugh, Mr. Bruce, and yourself. Were those parties in the room with Mr. Drawbaugh, or in the room with Mr. Bruce and yourself?

A. They were in the room with Mr. Drawbaugh.

Q. 13. Could you see Mr. Drawbaugh when he was talking into the machine?

A. No, sir.

Q. 14. Could you hear him except through the instrument?

A. No, sir.

Q. 15. How did you know that it was Mr. Drawbaugh that was talking, instead of some other party in the room with him?

A. I knew Mr. Dan Drawbaugh's voice very plainly.

Q. 16. Could you understand through the machine what he was saying?

A. Yes, sir; all that he spoke.

Q. 17. Was the machine into which he spoke connected in any way with the machine at which Mr. Bruce and you listened? If so, how?

A. There were two wires—they were connected by the wires.

Q. 18. Please look at the machines "B" and "F," now shown you, and state whether you ever saw them before. If so, when and where you first saw them.

A. Yes, those are the same machines I saw at Mr. Drawbaugh's shop at that time. I listened at the machine marked "B," and he spoke into the machine marked "F."

Q. 19. Do you remember whether the tumbler "F" had its bottom broken off at that time or not?

A. I did not observe that.

Q. 20. Do you remember whether it appeared to be lined with something white inside?

A. Yes, sir; it was lined.

Q. 21. Do you remember at that time seeing the electro-magnet on machine "B"?

A. Yes, sir; I seen that.

Q. 22. Do you recollect whether the end of the tin tube of machine "B," nearest to the electro-magnet, was covered with anything or not, at that time?

A. I think there was something there; I would not be positive, I think there was something.

Q. 23. Do you remember whether the tin box was lined with anything like plaster-of-Paris, or not?

A. I don't remember any more whether it was lined with anything or not.

Q. 24. Before you and Mr. Bruce went down there to Mr. Drawbaugh's shop, on that occasion, had you heard any talk in the neighborhood about his talking-machine invention or not?

A. Yes, sir.

Cross-examined by Mr. Smith:

Cross-Q. 25. How far is your place of residence from Eberly's Mills?

A. About a short mile.

Cross-Q. 26. How long did you listen to the machine while Mr. Drawbaugh was speaking?

A. He only spoke a couple of words.

Cross-Q. 27. How long did Mr. Bruce listen?

A. About the same length of time—just a couple of words.

Cross-Q. 28. What did Mr. Drawbaugh say to you about the invention?

A. He told us at that time that it was a speaking-machine.

Cross-Q. 29. Was that all he said?

A. That was all he said, with the exception—he did not say what distance, or anything of that sort. That was all that was said by him.

Cross-Q. 30. What do you mean by "with the exception?" What else, if anything, did he say?

A. He did not say anything more, I believe, on that subject.

Cross-Q. 31. How came he to show you the instruments?

A. We walked in there on purpose to see his machinery, and he commenced showing us then.

Cross-Q. 32. What did you say to him about the invention, at that time?

A. I thought it was quite an invention at the time—something very needful.

Cross-Q. 33. My question was, what you said to him about it at that time. Please state what you said, if anything.

A. I thought it would be very handy in a town, for talking through from one place to another.

Cross-Q. 34. When you told him that, did he make any reply?

A. Yes, he did speak something about it, but I couldn't say, really, what he did say concerning it.

Cross-Q. 35. Did you ever talk to him about it after that?

A. No, not after that.

Cross-Q. 36. Who were the neighbors that you heard speak about it before you went there?

A. I could not just remember.

Cross-Q. 37. Can't you give the names of some of them?

A. I couldn't just give the names to be positive.

Cross-Q. 38. According to your best recollection, who had you heard talk about the invention before you went to Drawbaugh's shop?

A. I think I heard Mr. Coble and Mr. George Free talking about it.

Cross-Q. 39. Any others?

A. No, I think not.

Cross-Q. 40. How often have you been in the habit of seeing Mr. Drawbaugh since that time?

A. I have seen him a half-dozen times, since that time, or maybe more.

Cross-Q. 41. You only live about a mile from him, don't you?

A. Yes, sir; a short mile.

Cross-Q. 42. Do you think you have only seen him a half-dozen times, during all these years, since that time?

A. I may have seen him, probably, more; I do not exactly know.

Cross-Q. 43. Do you mean that you probably have seen him more times than that?

A. I have seen him more than a half-dozen times, I suppose, but how many more, I would not be able to say.

Cross-Q. 44. Will you give me your best judgment as to how many times you may have seen him since your visit to his shop?

A. I don't suppose that I have seen him over eight times, at the outside.

Cross-Q. 45. When did you next see the instruments "B" and "F?"

A. I seen them about 1869.

Cross-Q. 46. When did you see them, and how long was it after you first saw them?

A. At Eberly's Mills, at the old clover mill there. I never saw them but one time when he operated on them. I was frequently there, but I never went for that purpose.

Cross-Q. 47. By the clover-mill, do you mean Mr. Drawbaugh's shop, where you first saw the instruments?

A Yes, sir; Mr. Drawbaugh's shop.

Cross-Q. 48. How frequently were you there?

A. I would go back and forward occasionally—every once in a while. Probably, once in a couple of weeks I was in there.

Cross-Q. 49. During what period of time did you go there, back and forth, occasionally?

A. I went there, back and forward, in 1868 and 1869. I went back and forward a good little bit.

Cross-Q. 50. And how much have you been there since 1869?

A. I ain't been there very often—not over eight or ten times in the whole time. I don't suppose I was there hardly that. I don't think that I was there that many.

Cross-Q. 51. In what years, since 1869, were those eight or ten visits, more or less, made?

A. In about the last two years back they were, the most of them, made.

Cross-Q. 52. After you saw the instruments in 1869, did you talk with any of your neighbors about them, or about the invention?

A. Yes; we used to talk about it. We thought it was a very great thing.

Cross-Q. 53. With whom did you talk about it?

A. With Mr. Frees there and Coble, as a general thing.

Cross-Q. 54. When did those talks take place?

A. It was right after the thing was completed, and had got into operation.

Cross-Q. 55. How many times do you think you talked with those men after you saw the instruments?

A. I don't hardly know. I suppose two or three different times.

Cross-Q. 56. When did you next see the instruments "B" and "F" after the first time you saw them in Drawbaugh's shop?

A. I don't know that I seen them afterwards; I can't recollect of it.

Cross-Q. 57. Did not you see them again afterwards, at any time, until you saw them here this morning?

A. Yes, sir; I seen them then once before I seen them here this morning.

Cross-Q. 58. When was that, and where?

A. They were brought to my place at White Hill. I don't remember whether it was late in the fall, or early in the spring, this last year.

Cross-Q. 59. Who brought them there?

IONE COMPANY,-1

A. Mr. Jacobs and Mr. Drawbaugh and 'Squire Bowman were together.

Cross-Q. 60. Did you make an affidavit about them?

A. Yes, sir.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 7th day of May, 1881.
FRED. M. OTT,
Examiner.

SAMUEL NICHOLS.

Adjourned until Monday, May 9th, at 10 o'clock, A. M.

May 9, 1881, 10, *A. M.*

Examination resumed, pursuant to adjournment.

Present, Mr. Smith for complainants, and Mr. Abraham and Mr. Jacobs for respondents.

JACOB H. RENEKER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. Age, fifty; residence, Lower Allen township, Cumberland county, near Eberly's Mills—about three eighths of a mile from there; by occupation a farmer.

Q. 2. How long have you resided there?

A. Six years, last March—since 1875.

Q. 3. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania; and, if so, how long have you known him?

A. I am acquainted with him, and have known him since April, 1875.

Q. 4. Did you ever see any talking-machines at his shop, at Eberly's Mills; and, if so, when did you first see them, and under what circumstances?

A. I did see some talking-machines there, or that he called talking-machines—about May, 1875, I first saw them. I was referred there to get a clock wheel repaired. He told me to come up some time, and he would show me his talking-machine. I was in a hurry that day that he fixed the wheels for me, so I went up Sunday afternoon, and he showed them to me, and talked through them.

Q. 5. Can you tell in what part of the month of May, 1875, you got the clock wheel fixed?

A. In the beginning of May some time.

Q. 6. Who fixed it for you?

A. Daniel Drawbaugh.

Q. 7. How long after that was your Sunday afternoon visit made?

A. Probably two weeks—one week or two—I could hardly tell.

Q. 8. Is there any circumstance which fixes in your mind the time of year at which that visit was made?

A. It was about the finishing up of corn-planting.

Q. 9. Please look at these instruments, marked "B," and "F," and state whether or not you saw them at that visit.

A. Yes, sir; I saw these.

Q. 10. Same question as to instrument marked "C."

A. I think almost I did; I am not so certain of this.

Q. 11. Same question as to instrument marked "A."

A. It looks much like one that I seen at that time.

Q 12. Did he talk through "B" and "F" to you, or through other instruments?

A. He did not talk through "B" and "F."

Q. 13. Where was the instrument into which he talked, and where was the instrument at which you were listening?

A. The one he talked through was up in his room, second floor, I think it is—was then. Where I went to listen was on the next floor below.

Q. 14. When you say second floor, do you count or omit the basement as a floor?

A. I omitted the basement as a floor.

Q. 15. Can you now distinctly recollect the appearance of the instruments through which he talked and you heard?

A. I cannot. This [indicating "A"] looks like the one at which I listened.

Q. 16. Did you, or not, hear distinctly the words which Drawbaugh spoke?

A. I could hear them distinctly.

Q. 17. Do you now remember any of them?

A. Not any of the words he spoke. I remember a little song that he sang through—or one verse of it only.

Q. 18. What was that?

A. Called "Old Folks at Home," I believe it is.

Q. 19. Did you, at that time, distinguish the tune only, or the words and the tune?

A. I could distinctly understand the tune and the words, too.

Q. 20. Did he, or did he not, speak other words through the machines, besides those of the song?

A. He did, but I don't remember them.

Q. 21. Did you understand them at the time they were spoken?

A. I did; quite plain, too.

Q. 22. From the location of the machines and the intervening spaces, and floors or partitions, could you have heard what he said and sang, except through the machine?

A. No, sir; I could not.

Q. 23. Could you, or could you not, distinguish the voice which you heard as that of Daniel Drawbaugh?

A. I could not at that time, not being acquainted with his voice then yet. He was a stranger then yet to me. I had not been long acquainted with him.

Q. 24. Did it sound like that of a man, as distinguished from the voice of a woman or a child?

A. It sounded like the voice of a man.

Q. 25. Did Daniel Drawbaugh, at that time, explain to you the principle upon which his talking-machines were operated?

A. He did, but I did not understand him.

Q. 26. Did he, or did he not, say anything about the use of electricity in connection with them?

A. I am not certain of that, but think most that he did.

Q. 27. After May, 1875, and down to the summer of 1880, did you continue to visit the shop of Daniel Drawbaugh?

A. I did.

Q. 28. Frequently, or only a few times?

A. Only a few times, except 1877. I was there frequently during that year.

Q. 29. During the period embraced in my last question, did you, or not, at different times, see Daniel Drawbaugh at work upon, or experimenting with, other talking-machines than those which you saw at your Sunday afternoon visit in May, 1875?

A. I did see him working at machines, at different times, that he told me were talking-machines.

Q. 30. What called you to his shop frequently during the year 1877, as you have testified?

A. I had some little business with him that year.

Q. 31. What was the nature of that business?

A. Trying to get some money out of him, which I had loaned him.

Q. 32. When did you loan it to him?

A. In May, 1877.

Q. 33. Under what circumstances?

A. He came to the field where I was working, told me he was very hard up, and wanted me to loan him about twenty dollars for two weeks, and I gave it to him.

Q. 34. Did he repay that loan all at one time, or a little at a time?

A. Only a little at a time, on different times; but the last in March, 1878.

Q. 35. How small were the partial payments?

A. As small as three dollars, perhaps some less; I don't recollect that.

Q. 36. Please state, if you know, where he got the money to make the final payment; and, if you recollect, what he said to you at that time.

A. To make the last payment, three or four dollars, he borrowed of the store-keeper at Eberly's Mills. He said he was very hard up for money, is all that I recollect of him saying.

Q. 37. At the time you made that loan to him, was there any other transaction between you and him?

A. There was; he wanted to trade me a bureau and secretary combined on provisions, such as meat, potatoes, butter, eggs, and lard, for his family, and we traded in that way.

Q. 38. Did he, or did he not, at that time say anything about being in want of provisions for his family?

A. He did say that he needed provisions very bad for his family.

Cross-examined by Mr. Smith:

Cross-Q. 39. Are the instruments "B" and "F" in the same condition now that they were in when you first saw them?

A. I think they are, except this plaster-of-Paris, or whatever it is. There is not as much in this one [indicating the tin tube of "B"] as I thought there was then when I first seen it. The box is the same, though.

Cross-Q. 40. Did you take those two instruments in your hand at the time you first saw them?

A. Yes, sir; they looked to be a novel thing to me—was the reason that I examined them more closely than I did the other machines.

Cross-Q. 41. When was the next time that you saw the instruments "B" and "F?"

A. I cannot tell positively. Some time in the fall of 1875.

Cross-Q. 42. How often have you seen them since that time?

A. I cannot tell.

Cross-Q. 43. Have you seen them frequently during the following years?

A. Not so very frequently.

Cross-Q. 44. In what years have you seen them since 1875?

A. I cannot tell positively. I think, though, every year since 1875.

Cross-Q. 45. Did you ever make an affidavit about Drawbaugh's talking-machines? If so, when and where?

A. Yes, sir; I did—some time last winter; I don't recollect what month, though—at Etter and Shanklin's mill.

Cross-Q. 46. Was it in the winter or the fall of last year?

A. Towards spring.

Cross-Q. 47. Who was present when you made that affidavit?

A. Mr. Jacobs, and Mr. Bowman, (I don't know his first name,)—'Squire Bowman—and Mr. Condry, the miller.

Cross-Q. 48. At the time you went to Drawbaugh's shop to get your clock-wheels fixed, what did he say to you about his talking-machine?

A. He told me that time I should come up and he would show them to me. I don't recollect what all he said to me, but he told me he thought he could make it—that he could talk through it to Harrisburg.

Cross-Q. 49. Do you remember whether he said anything about what he was doing with them, or what he intended to do ultimately with them?

A. I do not remember anything more of what he said than that he thought they would take the place of telegraphing.

Cross-Q 50. At the time when you saw the instruments on Sunday, what did he say about them?

A. I do not recollect what he said about them.

Cross-Q. 51. Did you say anything to him about them?

A. I did; I don't recollect what, though, just now.

Cross-Q. 52. How long were you there at that time?

A. I cannot tell positively; perhaps three hours or so.

Cross-Q. 53. Can't you remember anything that was said, either by him or by you, about the talking-machines during that three hours?

A. I do not remember anything that he said, just now, about them at that time. I do not remember anything that I said about them.

Cross-Q. 54. How many times were you at his shop during the remainder of the year 1875?

A. Probably half a dozen times—may be more or less.

Cross-Q. 55. Did you see the talking-machines, "B" and "F," more than once, in the year 1875, after the time you saw them on Sunday?

A. Yes, sir; I did.

Cross-Q. 56. Did you see the same ones that you did on Sunday, on each of those times?

A. I don't recollect whether I saw them each time I was there.

Cross-Q. 57. At the times that you did see them, were they the same instruments that you saw on the Sunday?

A. They looked to me to be the same.

Cross-Q. 58. Did you see any change in them?

A. There may have been changes, but I don't recollect of seeing any.

Cross-Q. 59. Did you and Mr. Drawbaugh talk about the talking-machines at any of your interviews in 1875, after that one on Sunday, of which you have spoken?

A. We did. He talked and tried to explain to me about them, but I did not understand much about what he told me.

Cross-Q. 60. Is that all that you recollect that was said about talking-machines between you and Mr. Drawbaugh, in the year 1875, after the Sunday?

A. It is all I can recollect of now.

Cross-Q. 61. What business was carried on in that shop during the year 1875?

A. I don't know much about the business, except repairing machines, and, I think, working some at the faucets.

Cross-Q. 62. Was Mr. Drawbaugh accustomed to repair machinery for those who wanted it repaired?

A. He did do some little jobs, still, that I knowed of.

Cross-Q. 63. What jobs, and for whom?

A. He repaired a thresher for Mr. Bricker. I think a steam engine for Mr. Shettel, too.

Cross-Q. 64. Can you think of any other jobs that he repaired?

A. No, I don't just now.

Cross Q. 65. Did you see, from time to time, a good many jobs of repairing being done at his shop?

A. I did not. I was not there very often, and so did not know what he was doing.

Cross-Q. 66. How often were you there during the year 1876?

A. Not very often. I can't say just how many times that year.

Cross-Q. 67. State, as nearly as you can, how many times you were there during the year 1876.

A. Probably five or six times, as near I can tell.

Cross-Q. 68. What business was being carried on there during that year?

A. About the same as before, as near as I can tell.

Cross-Q. 69. Did you see some repairing of machinery being done?

A. Some little. Seen them turning off some mill-spindles. I don't recollect of anything else they were doing.

Cross-Q. 70. How many times during the year 1876 did you see the machines "B" and "F?"

A. I cannot tell how often I saw them that year.

Cross-Q. 71. Did you see them more than once?

A. I cannot say. I may have seen them oftener and may not.

Cross-Q. 72. When you saw them, did you also see the other talking-machines which you saw on the Sunday?

A. I did see a lot of machines, but could not distinguish them so well as these, ["B" and "F."]

Cross-Q. 73. Do you think that you saw more machines that Drawbaugh said were talking-machines in 1876 than in 1875?

A. I cannot say that I did. I do not recollect much about them.

Cross-Q. 74. Do you recollect whether or not in 1876 you saw the machine marked "A," or one like it?

A. It looks very much like the machine I saw in 1876.

Cross-Q. 75. Did you, at any time in 1876, have any talk with Mr. Drawbaugh about the talking-machines?

A. I do not recollect of any; I may have had, though.

Cross-Q. 76. How came you to see the machines in 1876, and where were they?

A. They were in his room upstairs. I was in once or twice that he was working or studying at them, in 1876. I was not there often that year.

Cross-Q. 77. Did not he say anything about what he was doing on them or studying about?

A. Not that I recollect, as he was so busy, and we did not have much conversation about them.

Cross-Q. 78. You don't remember anything which you said to him about them in that year, do you?

A. I do not.

Cross-Q. 79. In 1877, when you were at his shop quite frequently, what business was being carried on?

A. I think about the same as before. May, perhaps, have been working at the clocks. Cannot tell for certain, though.

Cross-Q. 80. Do you recollect whether the spindle business or the faucet business was being carried on that year?

A. I do not. I did not stay there any length of time to see what was doing.

Cross-Q. 81. Was Mr. Drawbaugh generally doing something when you went there, or doing nothing?

A. He always appeared very busy when I was there.

Cross-Q. 82. Can't you tell what he was busy about?

A. He was studying about machines that I knowed nothing at all about, and working at them.

Cross-Q. 83. How many times did you see the machines "B" and "F" during that year?

A. I do not recollect how often I did see them.

Cross-Q. 84–5. Did you see them more than once, do you think?

A. I am not able to say. I may have seen them once, and perhaps oftener. I am not able to say.

Cross-Q. 86. Did you see them in the same place that you did in 1876?

A I don't recollect whether I did. They were changed around some.

Cross-Q. 87. Did you see, in 1877, any talking-machines there, besides those which you saw in 1875 and 1876?

A. I think there was some more.

Cross-Q. 88. How many more do you think?

A. I cannot say.

Cross-Q. 89. How came you to see them?—I mean the additional ones.

A. I saw them on his table—bench—when he was working on them—different machines.

Cross-Q. 90. What was he doing on them?

A. I cannot tell what. Working at them something—studying at them.

Cross-Q. 91. Did he say anything about them?

A. He did, sometimes.

Cross-Q. 92. What did he say?

A. I think about that time he told me that he could run them a longer distance.

Cross-Q. 93. Did he mention what distance?

A. Not that I recollect any more.

Cross-Q. 94. Did he say anything else about them at times when you saw them in 1877?

A. Not that I recollect about; he may have spoken about them, though.

Adjourned for dinner, until 2.15, P. M.

May 9, 2.15 *o'clock*, P. M.

Examination resumed, pursuant to adjournment.

Same counsel present.

Cross-Q. 95. Do you remember how the new machines, which you saw Drawbaugh working on in 1877, looked?

A. No, sir; I do not.

Cross-Q. 96. Do you remember whether they were shaped like "B" and "F," or more like "A?"

A. They were shaped more like "A," I think; some smaller.

Cross-Q. 97. Do you think they were round and thin, like "A?"

A. I think they were round and some thicker.

Cross-Q. 98. Did you say anything to him then—ask him any questions about them?

A. I do not recollect whether I did or not.

Cross-Q. 99. You have said that he was studying upon the machines. How did you know that he was studying upon them?

A. He told me that he was working at them.

Cross-Q. 100. Did he tell you anything about what he was trying to do?

A. Nothing more than making or working at his talking-machine or machines.

Cross-Q. 101. Did you ask him why he was working at them, or what he was trying to do?

A. No, sir; I did not.

Cross-Q. 102. How often were you at his shop in 1878?

A. I cannot say positively, but not very often.

Cross-Q. 103. What do you mean by that?

A. I don't—I was not there, I don't suppose, more than four or five times.

Cross-Q. 104. Did you go there any more during that year, after he paid you the last money in March?

A. I do not recollect whether I did or not.

Cross-Q. 105. What business did you see carried on there in 1878?

A. Not anything different from other years.

Cross-Q. 106. Did you see anything that year of the spindle business, the clock business, or the faucet business?

A. I don't recollect as I did.

Cross-Q. 107. How many times did you see the instruments "B" and "F" during that year?

A. I do not recollect.

Cross-Q. 108. Did you see any talking-machines there in that year that you had not seen before?

A. I don't think I did.

Cross-Q. 109. Did you hear, during the year 1877 and 1878, anything said by Mr. Drawbaugh, or among the neighbors, about an electric or magnetic clock which he had invented, and which would run without being wound up?

A. I did hear of such a clock, but do not know what years it was in.

Cross-Q. 110. Did you see any of those clocks?

A. I seen a clock there that they said would run without winding up.

Cross-Q. 111. Can not you tell when you saw that clock?

A. No, sir; not positively.

Cross-Q. 112. State, as nearly as you can, when it was.

A. It may have been some time between 1876 and 1878 or '9. I can't tell what year.

Cross-Q. 113. Did you see more than one such clock there?

A. No, sir; I did not.

IONE COMPANY,-1

Cross-Q. 114. How many instruments, shaped something like the instrument "A," but smaller, did you see in the year 1877?

A. I don't recollect—perhaps three.

Cross-Q. 115. Did you see them in 1878, at the same time or times that you saw "B" and "F"?

A. No, sir; I did not see them all together.

Cross-Q. 116. Did you see the smaller instruments at any time in 1878 which you saw Drawbaugh working on in 1877?

A. I do not recollect of seeing them in 1878.

Cross-Q. 117. Did you see them in 1879?

A. I don't recollect what years—1879 or 1880.

Cross-Q. 118 Did you see any talking instruments at Drawbaugh's shop in 1879 which you had not seen before?

A. Not that I recollect of now.

Cross-Q. 119. Did you have any talk with him about such instruments in 1879?

A. I cannot say now whether I had or not.

Cross-Q. 120. What business was carried on in his shop in 1879?

A. I do not know of anything different from what had been, as I had only been there a few times, and a very short time.

Cross-Q. 121. Do you know whether either the spindle business, or the clock business, or the faucet business was carried on there in 1879?

A. I do not know.

Cross-Q. 122. Do you know whether Mr. Drawbaugh was working or studying on talking-machines in 1879?

A. I do not recollect of seeing him at them in 1879.

Cross-Q. 123. Did you see any talking instruments after 1879 which you had not seen before?

A. No, sir; I did not.

Cross-Q. 124. At the time when you gave your affidavit, did Mr. Jacobs, or either of the other persons present, tell you what it was wanted for?

A. No, sir; not that I recollect of now.

Re-direct by Mr. Jacobs:

Q. Q. 125. You have been asked about the spindle or axle business. Do you remember of that business being carried on in the shop in which Daniel Drawbaugh worked by Bear, Kline, Moore, and Grove?

A. I believe it was carried on by some parties, in the spring of

1875, about the time I got the clock-wheel repaired. I did not know much about it, though.

Q. Q. 126. Were your visits to the shop generally very brief or protracted ?

A. Very brief, except the second visit. I spent considerable time there that time.

Q. Q. 127. Do you refer to the Sunday afternoon visit, when you first saw the talking-machines?

A. That is the time I have reference to.

Q. Q. 128. When you went to that shop, whom did you generally go to see?

A. Daniel Drawbaugh, about them times.

Q. Q. 129. When you had transacted your business with him, did you look around in the shop to see what business was carried on by others than Mr. Drawbaugh.

A. No, sir; I did not.

Q. Q. 130. Do you remember the fact of Mr. Drawbaugh's moving his family from Eberly's Mills to Mechanicsburg?

A. I do.

Q. Q. 131. Was the Sunday afternoon visit, during which time you saw the talking-machines, before or after that removal?

A. Before.

Re-cross by Mr. Smith:

Re-cross-Q. 132. What business did you have with Mr. Drawbaugh in the latter part of 1875 and 1876 that led you to visit him?

A. Nothing particular. I did not visit him often them years.

Re-cross-Q. 133. Why did you visit him in 1878 and 1879?

A. I do not recollect the particular business either of them years.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to this 9th day of May, 1881, before me.

FRED. M. OTT,
Examiner.

JACOB H. RENEKER.

JOHN WEBER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

HONE COMPANY,-1

A. I am fifty-one years old; reside in Hampden township, Cumberland county, Pennsylvania; I am a farmer.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills; sometimes it is called Milltown? If so, how long have you known him?

A. Yes, sir; I know the Milltown, and I know Drawbaugh from boyhood up.

Q. 3. Did you visit his shop in the year 1874?

A. Yes, sir.

Q. 4. What time of the year, and what conveyance did you go in?

A. About the latter end of December. I went in a sleigh.

Q. 5. What was the object of your visit in the latter part of December, 1874?

A. To ask whether he could make me a pitman connection on my reaper, for the sickle-bar, to my notion that I had to have it made.

Q. 5½. While you were there at that visit, did Mr. Drawbaugh show you any particular inventions of his? If so, describe those that he exhibited to you.

A. Yes, sir; he showed me a clock, that he called electricity clock, that he said he made. He also said it would run without being wound up, and then I said, "Daniel, you have always been a great genius, but never made much money by all your trouble." He said, "I have invented a great many machines, such as telegraph," then showed me that he could telegraph by writing on a silver paper—tin paper—and put that to the wire, and it would write the same at the other end. Then he said, "I have a talking-machine, that beats all the others of my inventions." Then he showed me some fixings for talking in. Now they—here is machines—[indicating "F."] This he showed me, and he said, "There you talk in, and at the other end there is one, that you must hold to your ear, to hear what was talked." I said, "Daniel, that is wonderful." Then he wanted me to go down stairs and he would talk to me, through this machine, [indicating "F,"] but I had no time to spare.

Q. 6. Did you ever see the instrument I now show you, marked "B?". If so, state when and where?

A. Yes, sir; I saw it the same day in the latter end of December, 1874, in his office, behind the door, in a kind of closet that he had.

Q. 7. Did it have any wire or wires attached to it?

A. I thought it was a string—he said it was wire wrapped like the old-fashioned bonnet wire—that ran down to the lower story of the building.

Q. 8. Were those two instruments both in the same closet, or where were they situated, respectively?

A. Those two were in the same closet; this [indicating "B"] and this [indicating "F"].

Q. 9. Do you recognize any of the other instruments on the table before you as having been seen by you at that time?

A. Yes, sir: here is one [indicating "A"] that I seen that very time.

Q. 10. Did Mr. Drawbaugh tell you what that was to be used for?

A. Yes, sir; he said that you must have it to receive what is talked; in this machine, [indicating "F"] he said, they talk into.

Q. 10½. Did either of you handle that machine "A?" If so, what did you do with it?

A. I just looked at it.

Q. 11. Did Mr. Drawbaugh place it in any position?

A. Yes, sir; he held it to his ear. He said that is the way to talk.

Q. 12. In what part of the building was that instrument "A," at that time?

A. Right in his office, above his work-bench.

Q. 13. Do you recollect having seen this instrument "C?"

A. I recollect seeing it.

Q. 14. Did Mr. Drawbaugh tell you the purpose for which that was intended, or what it was at all?

A. Yes, sir; he did. To talk in.

Q. 15. Which one of all the inventions and devices that Mr. Drawbaugh exhibited to you at that time made the most forcible impression on your mind?

A. All those machinery that he has here—talking-machines.

Q. 16. Did you, after you left his shop on this occasion, study and think over what he had said to you concerning conveying sound from place to place?

[*Objected to by Mr. Smith as leading.*]

A. Yes, sir; I did. I told my brother-in-law that Daniel Drawbaugh had got up a talking-machine. I thought it was a wonderful thing. That I told to my brother-in-law, Harry Springer.

Cross-examined by Mr. Smith:

Cross-Q. 17. Did you reside in 1874 where you now do?

HONE COMPANY,-1

A. Yes, sir.

Cross-Q. 18. How far is that from Drawbaugh's place?

A. We call it six miles.

Cross-Q. 19. Were you accustomed, before that time, to go to his shop from time to time?

A. No, sir.

Cross-Q. 20. Were you never there before?

A. Not the time he carried on the works, or rather not the time that he worked there.

Cross-Q. 21. Have you ever been there since?

A. Yes, sir.

Cross-Q. 22. How many times, and when?

A. Twice; the couple of last days in December, 1874, between the holidays, and then the latter end of January, 1875.

Cross-Q. 23. Was this instrument "F" in the same condition when you saw it that it is now?

A. Yes, sir; I think it was.

Cross-Q. 24. Was the instrument "B" in the same condition?

A. There was something wrapped around this here [indicating "B"] somewhere. It looked like a hog bladder, or something like that, fastened around here [indicating the rim of "B," next to the magnet.]

Cross-Q. 25. Have you stated all that Drawbaugh said to you, and you to him, at the time he showed you these machines?

A. I recollect that he said he could carry sound as far as Shiremanstown, or rather talk as far as Shiremanstown.

Cross-Q. 26. When did you next see these machines?

A. Last summer.

Cross-Q. 27. Who showed them to you?

A. Mr. Drawbaugh and this gentleman [indicating Mr. Abraham].

Cross-Q. 28. Had you talked to Mr. Drawbaugh about them before that time, and since the time you saw them before?

A. No, sir; not concerning the talking-machine.

Cross-Q. 29. How often had you seen him, after the time you first saw the instruments, and before you next saw them?

A. Probably five times.

Cross-Q. 30. When did you talk to Mr. Springer about them?

A. In the latter end of December, 1874.

Cross-Q. 31. Did you ever talk with anybody else about them before last summer?

A. Nobody, but to my family at home.

Cross-Q. 32. Did you make an affidavit concerning them last summer or fall?

A. No, sir.

Re-direct by Mr. Abraham:

Q. Q. 33. Did not you refuse to testify in this case unless you were brought before an Examiner of the court on a subpœna?

A. Yes, sir.

Q. Q. 34. You have spoken in your cross-examination of two visits, in the winter of 1874–'5, to Mr. Drawbaugh's shop, subsequent to the one mentioned in your examination-in-chief. Please state how long you were in Mr. Drawbaugh's shop on these last two visits.

A. Probably half an hour at each time.

Q. Q. 35. How were you occupied during those two visits?

A. Just in his office, asking him whether he had my reaper connection finished.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 9th day of May, 1881.

FRED. M. OTT,
Examiner.

JOHN WEBER.

JOHN H. STEPHEN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. Forty-nine years; reside in Hampden township, Cumberland county, near Shiremanstown; occupation farming.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county; and, if so, how long have you known him?

A. I have known him ever since I was a boy. We were raised within half a mile.

Q. 3. Have you ever seen any talking-machines at the shop in which he worked, at Eberly's Mills; and, if so, when, to the best of your recollection and belief, did you first see them?

A. Before 1875. I can remember very well. I might say 1870, but I am not certain on that. I visited Daniel Drawbaugh's shop from 1870 on.

Q. 4. To the best of your recollection and belief, how long before 1875 was it?

A. I wouldn't positively say just—I am not certain of the date—from 1875. It was before 1875. I am certain of that.

Q. 5. Please look at instruments marked "B" and "F," and state whether or not they are instruments which you saw at the shop in which Daniel Drawbaugh worked, at Eberly's Mills, before 1875.

A. I saw both of these before 1875. I am certain of that. I might have saw them in 1870, but I would not be qualified to that.

Q. 6. Who showed them to you?

A. Daniel Drawbaugh.

Q. 7. Did he tell you what they were for?

A. I asked him what he was working on now, and he told me different things; and he got this tumbler ["F"] and said he was working on a talking-machine, and explained it to me. He had this here ["B"] along, too, and some other things I don't just remember. He explained it to me, and, of course, I did not understand it, and I just laughed at it.

Q. 8. Where were the instruments when you saw them?

A. Second floor in his shop.

Q. 9. When he explained them to you, did he say anything about the use of electricity in connection with them?

A. Yes, sir; and wires.

Q. 10. Did you see any wires?

A. He got a piece of wire, and was showing me how it worked, you know. I don't remember whether it was here [indicating electro-magnet of "B"] or where.

Q. 11. Do you remember whether those coils of wrapped wire were upon the instrument marked "B," at the time you first saw it?

A. Yes, sir; they were.

Q. 12. Did he, or not, show you any batteries in connection with the instruments?

A. Yes, sir; he did.

Q. 13. Did he tell you what the instruments were for?

A. He said for a talking-machine he was getting up.

Q. 14. Did he, or did he not, say that they were intended to talk to a distance?

[*Objected to by Mr. Smith as leading.*]

A. Yes, he said they were to talk the same as you can telegraph, you know, in place of writing or making dots.

Q. 15. Please look at instrument "C," and state when, to the best of your recollection, you first saw it.

A. I could not positively tell when I first saw this one. I saw it, but I couldn't state when.

Q. 16. To the best of your recollection, did you see it before or after the year 1875?

A. I am not positive on that. I think it was after 1875. I saw it, I am certain, in 1876. I saw so many, you see, I am not positive.

Q. 17. Please look at the instruments marked "D" and "E," and state, to the best of your recollection, when you first saw them.

A. About 1875; in 1875. I remember this very well—this ring on [indicating the curled magnet on "D"].

Q. 18. Did you speak to any one about Drawbaugh's talking machines soon after you first saw them?

A. Yes, sir; I still went home and told them at home, and different ones I spoke to, and took some down to see his inventions that he was working on.

Q. 19. I refer to the occasion upon which you first saw the talking-machines "B" and "F." Did you, soon after that, speak to any one about them, at home or to strangers?

A. I did. I told them at home as soon as I got home. I went down there. Sometimes it was ten o'clock after night when I got home. They were wondering where I stayed so long. I told them when Dan was through with my work, he got to showing me his patent-rights, and told them what he was working at.

Q. 20. Did you, or not, tell them about the talking-machines which you had seen at Drawbaugh's shop?

A. Yes, sir; I told them about the clock, machine to wrap wire, and different other little things that he was working at.

Q. 21. What members of your family did you tell about Drawbaugh's talking-machines at that time?

A. I told my wife, two daughters, and hireling.

Q. 22. Subsequently to 1875, did you visit the shop at Eberly's Mills in which Daniel Drawbaugh was working?

A. I did; sometimes twice a day, and sometimes two or three times week.

Q. 23. Every year?

A. Every year. Sometimes I missed for a couple of months that I did not get there—from 1870 on up to this time.

Q. 24. Did you, or did you not, see at different times, between 1875 and the summer of 1880, other talking-machines which you had not seen before?

A. I saw Dan talking through this machine in 1880. I did not, previous to 1880, see other talking-machines which I had not seen before.

Q. 25. When you say "this machine," do you mean any of the machines concerning which you have already testified, or do you mean simply that he talked through *a* talking-machine?

A. I mean what I testified to. No, sir; it was something with two wires attached to it that I put to my ear. It was after night when he talked through it.

Adjourned until 9.30, A. M., May 10.

May 10, 9.30, A. M.

Examination resumed.

Present, same counsel.

Cross-examined by Mr. Smith:

Cross-Q. 26. How far do you live from Mr. Drawbaugh's shop?

A. About three miles.

Cross-Q. 27. Have you lived at the same place since 1870?

A. Yes, sir.

Cross-Q. 28. What kind of an instrument was it that you talked through in 1880?

A. Well, I didn't see the machine where he talked in. I was upstairs, and it was after night. It was a machine I held to my ear, with a couple of wires attached to it.

Cross-Q. 29. When you first saw the machines marked "B" and "F," were they in the same condition they are in now?

A. As near as I can remember, they were.

Cross-Q. 30. Did you see them often between the time you first saw them and 1880?

A. Yes, sir; I seen them often. They were laying on the benches around there.

Cross-Q. 31. You never noticed, I suppose, any difference in them after you first saw them?

A. No, sir; I never noticed anything different—never took particular notice about them.

Cross-Q. 32. Will you now look at the instruments put on the table, and see if you can find the instrument you listened to in 1880, or one like it?

A. I ain't certain, there are so many here, and I didn't take particular notice, but it was something that had two wires to it—something like this [holding up instrument "M."]

[*The instruments on the table are* "*A,*" "*B,*" "*C,*" "*D,*" "*E,*" "*F,*" "*G,*" "*I,*" "*K,*" "*L,*" "*M,*" "*N,*" *and* "*O.*"]

Cross-Q. 33. At the time when you listened to the instruments, in 1880, what did Mr. Drawbaugh say about the instruments, or about the talking-machines?

A. He said he could talk a distance with it—any distance, I think he said.

Cross-Q. 34. What other things, besides talking-machines, did you see at Drawbaugh's shop from 1870 to 1880? I mean things that he invented.

A. Well, I saw a clock, and different other little things that he was working on; a machine to wrap wire. That is about all that I know. He had a great many little knick-knacks there, that he showed.

Cross-Q. 35. Do you know whether he got patents on any of the things which he had invented? If so, on what ones, that you remember?

A. I don't remember on what ones. I know he got on some. I never asked him.

Cross-Q. 36. Have you ever made an affidavit concerning what you know about the talking-machine?

A. Yes, sir.

Cross-Q. 37. When did you make it?

A. From paper now shown me, I am satisfied the date was March 1, 1881.

Cross-Q. 38. Where were you when you made that affidavit, and who was present?

A. At home. Mr. Jacobs, Harry Bowman, justice of the peace, and Daniel Drawbaugh were present.

Cross-Q. 39. Did Mr. Jacobs tell you what he wanted the affidavit for?

A. Yes, sir; I think he told me what it was for.

Cross-Q. 40. What was it for?

A. He said there was another company claimed it, and they were

HONE COMPANY,-1

trying—at any rate it was, they were going to try to see what they could do with the other company—that Daniel claimed it, you know.

Re-direct by Mr. Jacobs:

Q. Q. 41. Were you visited by Mr. Drawbaugh and myself, with relation to this matter, before the time when your affidavit was taken?

A. Yes, sir; four or five times.

Q. Q. 42. Please state whether, at our first visit, some time last summer, you did not describe to us instruments "B" and "F" before we showed them to you, particularly the tin box with the coils of wrapped wire.

A. I did.

Re-cross by Mr. Smith:

Re-cross-Q. 43. Did you make an affidavit last summer or fall about them?

A. No, sir; I did not, when they came to see me, for the very reason that I did not want to have my time taken up by calculating to come to this. That was the very reason. They came to me five or six times.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 10th day of May, 1881.

FRED. M. OTT,
Examiner.

JOHN H. STEPHEN.

EZEKIEL WORLEY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. My age is seventy-one; residence, Lower Allen township, Cumberland county; occupation, farming.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, sometimes called Milltown?

A. Yes, sir.

Q. 3. How long have you known him?

A. I suppose thirty-five years. He was a small boy yet, when I knew him.

Q. 4. Are you acquainted with Mr. Jacob R. Miller, of Miller s Mill ?

A. Yes, I am acquainted with the man that you have reference to, but he don't live at Miller's Mill.

Q. 5. Where does Mr. Miller now live?

A. At Shiremanstown.

Q. 6. Where did he formerly live?

A. At the mill—Miller's Mill.

Q. 7. Do you know when Mr. Jacob R. Miller moved away from Miller's Mill? If so, please state.

A. He moved away from there eight years ago this last spring.

Q. 8. Did you have any transaction with Mr. Miller, regarding lumber or logs, prior to his removal from Miller's Mill?

A. Yes, sir.

Q. 9. Please relate the transaction, and any particular circumstance that you remember in relation thereto.

A. I had sold him some lumber—some logs—that he bought and sawed up.

Q. 10. Did you deliver to him all that you sold? If not, state the reason wherefore.

A. I delivered him all that I sold him, and more, too. Some he did not use; did not take them off my hands. The oak he used, and the hickory he did not.

Q. 11. Were any of your logs carried away by a freshet about this time?

A. There was one of them the water took away, the creek getting high.

Q. 12. Did you discover this lost log soon after. If so, where?

A. It was some time after, but I could not tell you how long. It might have been two or three months, and may not have been more than a month; as far as that is concerned, I could not tell how long it was. I discovered it on the bank of the creek, above his factory, at Milltown, as they call it.

Q. 13. Whose factory do you mean?

A. I don't know who owns it at the present time. It was called the Milltown factory, or pump or faucet factory. For my part, I don't know who are the owners of it.

Q. 14. Do you mean the building at Eberly's Mill that used formerly to be known as the clover-mill?

HONE COMPANY,-1

A. It used to be a clover-mill, I believe. They used to grind plaster there, too, I believe.

Q. 15. Was anybody with you when you discovered this lost log? If so, please state who it was.

A. Mr. Taylor was along with me.

Q. 16. Did you go into the mill with Mr. Taylor?

A. Yes, sir; we went in together.

Q. 17. Now state whom you saw in the mill, and what transpired there.

A. We saw Mr. Daniel Drawbaugh. That is too difficult for me to tell what transpired there. We were looking at his machinery—his different things—his clocks that he had invented, run by telegraph—or not by telegraph, but by electricity—and a good many things; I can't just tell you what all. For he was a man that had a great many notions agoing among the rest his telephone—talking-machine, as we called it at that time, telling about it.

Q. 18. Did he show you any of his instruments belonging to his talking-machine?

A. He showed some things there, that he said belonged to it; but he didn't talk any through it, that I recollect of now.

Q. 19. Did he explain to you anything regarding the manner in which it was operated?

A. He talked about working it upon the principle of telegraphy. That was his idea.

Q. 20. Would your memory serve you to identify and recognize any of the instruments relating to his talking-machine that he showed you at that time, if they were now presented to you for examination?

A. No, sir.

Cross-examination waived by Mr. Smith.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 10th day of May, 1881.

FRED. M. OTT,
Examiner.

EZEKIEL WORLEY.

HENRY N. SHOOP, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. Age, thirty-three; residence, Camp Hill; occupation, carpenter.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania, and if so, how long have you known him?

A. I am acquainted with Mr. Daniel Drawbaugh for fifteen years, or more.

Q. 3. Did you ever see any talking-machines at the shop in which he worked, at Eberly's Mills: If so, when did you first see them, and under what circumstances?

A. I saw one in the latter part of August, 1873. I was secretary of the band at the time. There was to be a picnic at Milltown—a Sunday-school picnic—and I was one of the committee to see the Sunday-school committee about hiring the band. I went in with Hiram K. Drawbaugh, and I went into the machine-shop, and he showed me the—talking-machine it was called.

Q. 4. Do you remember the appearance of the talking-machine which you then saw?

A. I remember a tumbler with the bottom knocked out.

Q. 5. [Mr. Jacobs now hands witness instrument marked "F."] Does that look like it?

A. Yes, sir; it does.

Q. 6. Was there but the one instrument—the glass tumbler?

A. That is all I saw at that time.

Q. 7. Was the instrument explained to you at that time?

A. I was told it worked by a battery, or electricity.

Q. 8. Who told you so?

A. H. K. Drawbaugh.

Q. 9. Did he tell you who had made the talking-machine?

[*Objected to by Mr. Smith as hearsay.*]

A. Yes, sir; his Uncle Dan.

Q. 10. Was Daniel Drawbaugh at the shop at that time?

A. No, sir.

Q. 11. Where did you then reside?

A. At Camp Hill.

Q. 12. State whether or not you afterwards moved to Eberly's Mills. If so, when, and how long did you reside there?

A. I moved there in February, 1877, and moved away in November, 1877.

Q. 13. Whilst residing there, did you visit the shop in which Daniel Drawbaugh worked?

A. Yes, sir.

Q. 14. How soon after you moved to Eberly's Mills did you make your first visit to the shop?

A. In a day or so. I went there to grind some tools.

Q. 15. Please state whether or not you then and there saw other talking-machines which you had not seen before.

A. I did. I saw several that I had not seen before. Some were finished and some not finished.

Q. 16. Please look at instruments marked "D" and "E," and say whether or not you saw them there at that time.

A. That one I saw, [indicating "D,"] or one very much like it. I was attracted by that iron on the bottom [pointing to curled magnet on bottom of instrument "D."] I asked Mr. Drawbaugh what that was intended for. He told me that it belonged to his talking-machine.

Q. 17. Was that machine finished or unfinished when you saw it there on that occasion?

A. I think it was as it is now, finished.

Q. 18. Do you remember the appearance of any of the instruments which you saw there at that time in an unfinished state?

A. I saw him working on cups like these [pointing to mouth-piece of instrument "D" that were not finished.]

Q. 19. On one or more than one?

A. One or so. He was working at one or so on his bench. There was more than one.

Q. 20. How many finished instruments did you see there at that time?

A. That is more than I can tell. I did not examine them all.

Q. 21. More than one?

A. Yes, sir.

Q. 22. Did you make other visits to that shop during your visit to Eberly's Mills?

A. Yes, sir.

Q. 23. Please state whether or not, during those visits, you saw Daniel Drawbaugh at work upon talking-machines.

A. I can't remember exactly of his being at work on talking-machines. I have often seen things lying on his bench that belonged to it, but whether he was at work at the time or not I could not tell.

Q. 24. Do you mean by that that you do not now remember?

A. I do.

Q. 25. Have you been at that shop since you moved away from Eberly's Mills in November, 1877?

A. I have not.

Cross-examined by Mr. Smith:

Cross-Q. 26. When you moved away from Eberly's Mills, did you move to your present residence?

A. I did; yes, sir.

Cross-Q. 27. How far is that from Drawbaugh's shop?

A. About two miles.

Cross-Q. 28. When you saw instrument "F," in 1873, was it in the same condition as it is now?

A. It was, as far as I can remember.

Cross-Q. 29. At the time you first saw instruments at Drawbaugh's shop in 1877, where were they—I mean in what part of the shop?

A. Some were in the draft room. Some on the bench where he was working.

Cross-Q. 30. What did he say to you about them at that time?

A. I asked him whether it would work. He said he had it in working order. Yes, sir.

Cross-Q. 31. Was that all he said about them, that you can remember?

A. Yes, sir; it was.

Cross-Q. 32. Do you remember how long you looked at the instruments at that time?

A. A short time. I had to go to work in the afternoon, and I was in a hurry.

Cross-Q. 33. At any of your subsequent visits to the shop, when you saw talking-instruments, did you have any talk with Drawbaugh about them?

A. Not in particular. No, sir; I never went there unless on business.

Cross-Q. 34. Did you, at any time during the next two or three years after you moved away, talk with him about them?

A. No, sir; I saw him very little after I moved away from there.

Cross-Q. 35. Have you made an affidavit relating to the talking-machines? If so, when and where?

HONE COMPANY,-1

A. I have. I think it was in February, in 'Squire Bowman's office. From a paper shown to me by Mr. Jacobs, I fix the date as February 9, 1881.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 10th day of May, 1881.
FRED. M. OTT,
Examiner.

H. N. SHOOP.

May 11, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Smith for complainants, and Mr. Abraham and Mr. Jacobs for respondents.

RUFUS K. SHIREMAN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. Age, twenty-eight years; residence, Shiremanstown; occupation, painter.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pennsylvania?

A. I am.

Q. 3. How long have you known him?

A. I may say ever since I was able to recognize or remember the name of any one.

Q. 4. Have you frequently visited the shop where he has been working, from time to time, at Eberly's Mills?

A. I did.

Q. 5. At any of these visits, did he speak to you about a talking-machine that he said he had invented?

A. Yes, sir.

Q. 6. How long ago was the first time?

A. Not less than eight years.

Q. 7. Can you fix the year, and the time of the year? If so, please do so.

A. It was in the fall of the year, but whether it was in the year 1872, or not, I could not say.

Q. 8. Did he, at that time, show you any instruments that he said belonged to his talking-machine?

A. He did.

Q. 9. Please look at instruments "B" and "F," now shown you, and state whether you ever saw those before.

A. I did.

Q. 10. Did you see them at the time of this visit, concerning which you have testified?

A. I did.

Q. 11. Please state in what part of the building they were respectively located when you saw them at that time.

A. North-eastern part. They were both there.

Q. 12. Did Mr. Drawbaugh explain to you on what principle they were operated? If so, please state what he told you.

A. By magnetism.

Q. 13. Did he state what he could accomplish by means of these instruments?

A. Yes, sir.

Q 14. What did he say he could do with them?

A. Convey the voice or sound to a great distance.

Q. 15. Did he speak through them to you, or in your presence, on that occasion?

A. No, sir.

Q. 16. When did you next visit Mr. Drawbaugh's shop?

A. I could hardly give the correct time. Somewhere in about three months.

Q. 17. Then this second visit of yours was not more than four months after your first one, was it?

[*Objected to by Mr. Smith as leading.*]

A. No, sir.

Q. 18. At this second visit, did Mr. Drawbaugh again show to you his talking-machines?

A. He did.

Q. 19. Did you then see again these instruments "B" and "F?"

A. I did.

Q. 20. Did you see any other instruments besides these two?

A. I did.

Q. 21. Did Mr. Drawbaugh operate any of these instruments in your presence?

PHONE COMPANY,-1

A. He did.

Q. 22. Now state what he did, if you please.

A. Spoke through them to me.

Q. 23. Where were you and where was Mr. Drawbaugh when he spoke to you through his talking-machine?

A. I was in the room on the second floor in the north-east corner of the building. I could not say in what part of the building he was in.

Q. 24. Could you see him while he was speaking to you through the instrument?

A. I could not.

Q. 25. In what position were you and in what position was the instrument through which you heard?

A. The instrument was fastened against the north wall of the building; I was standing.

Q. 26. How near were you to the instrument through which you heard?

A. Very close to it.

Q. 27. Did you understand distinctly the words that reached your ear?

A. I did.

Q. 28. Did you recognize the language as being in the voice of any particular person? If so, whose voice did you recognize?

A. I did—Mr. Drawbaugh's.

Q. 29. Besides recognizing the voice of Mr. Drawbaugh, did you correctly and distinctly hear the spoken words through the opening of the instrument near which you were then standing?

[*Objected to by Mr. Smith as leading.*]

A. I did.

Q. 30. Did you see any connections attached to the instrument through which you were listening?

A. Not more than wire.

Q. 31. Did you follow with your eye the course the wire took that was attached to this instrument?

A. Yes, sir.

Q. 32. Now state in what direction you saw this wire led.

A. It run from the machine towards the ceiling, and then a westerly course, I may say, along the angle of the room, upon the ceiling.

Q. 33. What kind of wire was this?

A. It was a wire wrapped with white cord, or cotton, or something of the kind.

Q. 34. You have stated, in reply to a former question, that the interval between these two visits, concerning which you have testified, was somewhere about three months. Are you not able to fix a limit definitely of the longest time that elapsed between these two visits?

A. I am not.

Q. 35. Are you sure it was within six months?

A. I am.

Q. 36. Did you visit Mr. Drawbaugh's shop after this second visit, during the past seven and a half years?

A. I did.

Q. 37. About how frequently?

A. I could not say.

Q. 38. During these subsequent visits, has Mr. Drawbaugh exhibited to you any other instruments which he said belonged to the talking-machine, besides the two, "B" and "F," concerning which you have testified?

A. He did.

Q. 39. Now, please examine the various instruments spread upon the table, and see whether you have seen any of them, at any of the subsequent interviews you have last referred to?

A. I have. I have seen this instrument marked "E," this one "A," also "I" and "D." I don't remember seeing any more.

[*The remaining instruments on the table are* "*G,*" "*J,*" "*K,*" "*L,*" "*M,*" "*N,*" *and* "*O.*"]

Q. 40. Which, among these four which you have selected, did you see at the earliest period?

A. I could not say.

Q. 41. In your answer to question 39, after having selected four instruments and identified them, you say: "I do not remember of having seen any more." Do I understand you to say that you did not see any more instruments, or that you do not identify any more of those spread before you?

A. I do not identify any of those spread before me.

Q. 42. Did you see, at these subsequent visits, any more instruments, besides those identified, that Drawbaugh told you belonged to his talking-machines?

A. I can't remember.

Q. 43. Did you in any of your visits, subsequent to the year 1872, see Mr. Drawbaugh working on any instruments that he said belonged to his talking-machines?

A. I did.

Q. 44. What, if anything, did he say to you that he was doing with his talking-machines?

A. Making improvements on it all the time.

Q. 45. How often did he say that to you?

A. I could not say.

Q. 46. Did Mr. Drawbaugh frequently speak to you in reference to his talking-machines, upon your visits, during the past eight years?

A. He did.

Q. 47. And did you, as frequently, find him at work on instruments appertaining to his talking-machine?

A. I did.

Q. 48. And did he, on those occasions, mention what he was doing?

A. I can't remember whether he did every time, or not.

Cross-examination by Mr. Smith:

Cross-Q. 49. Have you, previous to this time, made an affidavit respecting Drawbaugh's talking-instruments?

A. I have.

Cross-Q. 50. When did you make it, and who was present?

A. I am not able to give the date; last fall, in October, I may say. Mr. Drawbaugh, Mr. Jacobs, Mr. Bowman, and Mr. Railing were present.

Cross-Q. 51. Where were you when you gave it?

A. At Shiremanstown.

Cross-Q. 52. Have you always resided at Shiremanstown?

A. I have, with the exception of one year.

Cross-Q. 53. In answer to interrogatory seven, asking you to fix the time when Drawbaugh first spoke to you about talking-machines, you say: "It was in the fall of the year, but whether it was in the year 1872 or not I could not say." Why did you name that year?

A. In 1873, on up to 1875, I was only about now and then. I generally fish for trout, and when I go by there I generally stop in to see him, and those few seasons I did not follow any.

Cross-Q. 54. Were the instruments "B" and "F," at the time you first saw them, in the same condition that they are now?

A. No, sir.

Cross-Q. 55. In what respect was their condition different from what it is now?

A. Why, they were coated considerably better on the inside than what they are.

Cross-Q. 56. Is that all the difference that you see between their present condition and their condition then?

A. It is.

Cross-Q. 57. How came Mr. Drawbaugh to show them to you?

A. I generally take an interest in something of the kind, and I was looking at other machines there, and among them he showed me his talking-machines.

Cross-Q. 58. Whereabouts in the room were they when he showed them to you?

A. In the north-east corner, on some kind of a table or other—I don't know whether it was just a table or not.

Cross-Q. 59. What other machinery were you looking at at that time?

A. I fail to remember; but it was for registering drinks, or something of that kind, in a hotel.

Cross-Q. 60. Something that he had invented?

A. He claimed so.

Cross-Q. 61. What business was being carried on at that shop at that time?

A. I fail to remember.

Cross-Q. 62. At any of your visits after that, during the succeeding eight or nine years, did Mr. Drawbaugh show you any other inventions that he was at work on or had made, besides talking-machines?

A. Yes, sir.

Cross-Q. 63. Will you tell me what they were?

A. I don't remember.

Cross-Q. 64. Can't you call to mind any of them?

A. A clock. I don't know the names of the other. I can hardly say now.

Cross-Q. 65. Do you think there were a number of them?

A. Yes, sir.

Cross-Q. 66. Can you tell what they were any of them for?

A. No more than I mentioned before.

Cross-Q. 67. At the time of your first visit, when you saw the instruments "B" and "F," was any one else present?

A. I think there was.

Cross-Q. 68. Can you tell who?

A. Yes; A. G. Snyder.

Cross-Q. 69. At the time of your second visit, some three months later, what other talking-instruments besides "F" and "B" did you see?

A. Those four lying on the table, "A," "D," "E," and "I."

Cross-Q. 70. Did you see either of these four at the time of your first visit?

A. I think I did.

Cross-Q. 71. All of them?

A. I could not be positive.

Cross-Q. 72. Which ones of them do you feel most positive about?

A. That one ["I"]. I could not say to any of the rest.

Cross-Q. 73. Which one did you listen to when Mr. Drawbaugh spoke to you?

A. I could not tell.

Cross-Q. 74. How long did he speak to you, at the time of the second interview, through the instruments?

A. Perhaps, about three minutes.

Cross-Q. 75. Do you remember what he said?

A. I do not.

Cross-Q. 76. Do you know what instrument he used to speak into?

A. I do not.

Cross-Q. 77. How near was your ear to the instrument that you listened to?

A. It was close to it.

Cross-Q. 78. At any of the times when Mr. Drawbaugh told you he was making improvements on his talking-machines, did he say anything about what his improvements were, or what he was trying to do?

A. He explained improvements to me, but I don't remember what they were.

Cross-Q. 79. Can't you remember anything that he said about any of the improvements?

A. No, sir.

Cross-Q. 80. When did you next see the instruments "B" and "F," after the second time that you saw them?

A. I don't remember.

Cross-Q. 81. Did Mr. Drawbaugh say anything to you at any time about what he should do with his talking-machines, when he got through making improvements upon them?

A. No more than that he was just going to make the grandest thing out

Cross-Q. 82. When did he say that to you?

A. At different times.

Cross-Q. 83. How lately do you remember his saying that to you?

A. I can't give no date, but it is quite a while.

Cross-Q. 84. That is all that you remember, is it, of what he said about his improvements?

A. Yes, sir.

Re-direct by Mr. Abraham:

Q. Q. 85. When you first saw instrument "B," do you recollect whether those two coils of green wire were there at that time?

A. I think not; I think they were white.

Q. Q. 86. Do you know whether the end of this can, next to the wires, was open or not?

A. I don't remember.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 11th day of May, 1881.
FRED. M. OTT,
Examiner.

RUFUS K. SHIREMAN.

JACOB HAWN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. My age is fifty years; I reside at Wormleysburg, Cumberland county, Pa.; I am a blacksmith by trade.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa., and if so, how long have you known him?

A. Yes, sir; I have known him for twenty years.

Q. 3. How long have you resided at Wormleysburg?

A. Since 1872.

Q. 4. Please state what time in 1872, if you can.

A. On the 27th of May.

Q. 5. Where did you reside prior to that time?

A. At Middletown, Dauphin county.

Q. 6. How long?

A. I moved to Middletown in 1861.

Q. 7. Did you ever visit the shop of Daniel Drawbaugh, at Eberly's Mills, whilst you resided at Middletown; and if so, once, or more than once?

A. Yes, sir; I visited it often.

Q. 8. During those visits, did you, or did you not, see any talking-machines there?

A. I did.

Q. 9. Among the instruments now before you on the table, can you identify the talking-machines which you then and there saw?

A. Yes, sir.

Q. 10. Please point them out.

A. This is one [indicating "B,"] and this one I know [indicating "F."]

Q. 11. Do you mean that you saw instrument "F" then and there?

A. Yes, sir.

Q. 12. Can you tell how long it was before May 27, 1872, that you saw the instruments that you have identified at Drawbaugh's shop?

A. No, sir; I cannot.

Q. 13. Who showed them to you?

A. Mr. Daniel Drawbaugh.

Q. 14. Did he explain them to you at the time, and tell you what they were for?

A. Yes, sir.

Q. 15. What did he say they were for?

A. For a talking-machine.

Q. 16. Did he tell you by what means they were operated?

A. Yes, sir.

Q. 17. Please state what he said on that subject, as nearly as you can recollect.

A. He said they would be operated on by a battery.

Q. 18. How far did he say he could talk with them?

A. He said that he would be able to operate, that a man preaching in

New York, that a congregation in Philadelphia would hear the same sermon.

Q. 19. Did he talk through them to you?

A. No, sir.

Q. 20. What reason, if any, did he assign for not doing so?

A. His wires were out of order, I think.

Q. 21. Have you visited that shop since the 27th of May, 1872?

A. Yes, sir.

Q. 22. How often, as nearly as you can tell?

A. I suppose once a year since then.

Q. 23. Do you think that you have been there every year since then?

A. Yes, sir.

Q. 24. State whether or not, during those visits, he has shown you other talking-machines.

A. Yes, sir.

Q. 25. Did they, as you first saw them, from time to time, have the appearance of being new machines, or old?

A. They appeared to be new ones.

Q. 26. Did you, or did you not, to the best of your recollection and belief, see new machines there during each year, from May 27, 1872, down to the summer of 1880?

A. I did, to the best of my knowledge.

Q. 27. Did Daniel Drawbaugh, from time to time, during those visits, show and explain those talking-machines to you?

A. Yes, sir.

Q. 28. Did he say anything about making improvements upon them from time to time? If so, what did he say?

A. He always said that he was improving them.

Q. 29. Did he make any comparison between his talking-machines and the telegraph? If so, what did he say?

A. He said that it would take the place of the telegraph, and that it would be better. He said that common people could use it better than telegraphing.

Q. 30. Did he explain why?

A. He said that people could talk to one another better than write it out.

Q. 31. Among the instruments now before you on the table, can you point out any besides "B" and "F" that you saw at Daniel Drawbaugh's shop prior to 1880?

A. Yes, sir; this one I can remember of seeing [indicating "I"] and that one I remember [indicating "A."] If you will listen, I will give you a little circumstance. When he first showed me "A," I thought it was a tape-line box.

Q. 32. Are you able to identify any of the others?

A. Not of these here ones, I am not.

[*On the table are instruments "A," "B," "D," "E," "F," "G," "I," "J," "K," "L," "M," "N," and "O."*]

Q. 33. Can you tell the general appearance of the new instruments that you saw from time to time at Drawbaugh's shop, as to size, material of which they were made, &c.?

A. The one was a pretty large one with a bell on the top of it. The others were smaller, of dark walnut wood, I suppose.

Q. 34. Did the smaller instruments at all resemble any of the instruments now on the table which you have not identified?

A. Yes, sir; I think they did.

Adjourned until 2 o'clock, P. M., for dinner.

Examination resumed pursuant to adjournment, at 2 o'clock, P. M.

Q. 35. Please look at the coils of wrapped wire on instrument "B," and say whether you remember of seeing them, or similar coils, upon that instrument when you first saw it before May 27, 1872.

A. I seen those, or something like them.

Q. 36. At that time?

A. Yes, sir.

Q. 37. During your various visits to the shop in which Daniel Drawbaugh worked, did he display much interest in explaining to you his talking-machines?

A. He did; more than in any other thing that he had.

Cross-examined by Mr. Smith:

Cross-Q. 38. Have you made an affidavit, in relation to the talking-machines, previous to this time?

A. Not previous to this time.

Cross-Q. 39. Will you give your best judgment as to how long it was before you moved away from Middletown when you first saw the instruments "B" and "F?"

A. I can't give any time.

Cross-Q. 40. Were they, at the time you saw them, before moving from Middletown, in the same condition that they are now?

A. I think they were about the same.

Cross-Q. 41. If you notice any difference, will you tell what it is?

A. I can't tell any difference.

Cross-Q. 42. How often do you think that you have talked to Drawbaugh about his talking-machines since you moved away from Middletown?

A. I can't tell how often, but he has talked to me several times.

Cross-Q. 43. Can you tell what he has said to you about them those times, or at any one time?

A. He has always said that it would be a better thing than the telegraphing, and would be a success.

Cross-Q. 44. Do you remember anything that he said about the nature of the improvements that he was making?

A. The nature of the improvements were to make it more perfect.

Cross-Q. 45. Did you talk with him about the talking-machine more than once before you moved away from Middletown?

A. I can't tell. It is most likely that I did.

Cross-Q. 46. Did you see the instruments "B" and "F" more than once before you moved away from Middletown?

A. That I can't tell, neither. It is about like the other. It is most likely that I did.

Cross-Q. 47. How often did you see the instruments "B" and "F" after you moved away from Middletown?

A. I saw them several times. I can't just give the definite number how often. Most every time I would go up to his shop he would explain to me, and show me his different machines.

Cross-Q. 48. Did he show you any other inventions that he was at work upon after you went away from Middletown?

A. Yes, sir.

Cross-Q. 49. What ones?

A. He showed me a clock he was working on; a patent spindle that they were making up there. He showed me some of them. That is about all.

Cross-Q. 50. Did he manifest much interest in the clock?

A. Not so much as he did in the talking-machine.

PHONE COMPANY,-1

Cross-Q. 51. Did you know anything about the manufacture of faucets in the shop after you moved away from Middletown ?

A. I think they were manufactured by another company afterwards.

Cross-Q. 52. In what years?

A. I can't tell the years.

Cross-Q. 53. Was it soon after you moved away from Middletown, or within the last three or four years?

A. My best judgment is that it was within the last three or four years.

Cross-Q. 54. Did you understand that the faucet they were making was one of Drawbaugh's invention?

A. Yes, sir.

Cross-Q. 55. Did he ever explain it to you or manifest much interest in it?

A. He explained it to me, but never manifested a great deal of interest in it. It was rather a simple thing, and did not require much.

Cross-Q. 56. Can you tell in what years you saw the spindle business going on?

A. I can't name the year.

Cross-Q. 57. Did you ever ask Mr. Drawbaugh why he did not put his talking-machine into use?

A. No, sir.

Cross-Q. 58. Did he ever say anything to you about being ready to put it into use?

A. Not that I remember of.

Cross-Q. 59. You spoke of seeing one talking-machine with a bell on it; when did you first see that instrument?

A. I can't tell when I first seen it.

Cross-Q. 60. Can't you give some idea whether it was two or three years ago, or six or eight?

A. No, sir; I can't.

Cross-Q. 61. What did Mr. Drawbaugh say to you about it?

A. I don't remember.

Cross-Q. 62. Can you describe the appearance of any other talking-instrument which he showed you as an improvement?

A. He showed me those smaller wooden boxes, made of walnut or black wood.

Cross-Q. 63. And did he tell you in what respect they were better than those he had had before?

A. Yes, sir; he would explain it to me.

Cross-Q. 64. In what respect did he say they were better?

A. I could not tell now in what respect. He would say it was an improvement on the last ones, still.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 11th day of May, 1881.
FRED. M. OTT,
Examiner.

JACOB HAWN.

HENRY M. DARR, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. I am fifty-six years old; I live in Lower Allen township, Cumberland county, a short mile from Shiremanstown. I am a day's laborer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. Yes; I have known him twenty-five or thirty years already.

Q. 3. How long have you lived where you now reside?

A. Two years the first of last April.

Q. 4. Where did you reside prior to the fall of 1874?

A. On "Slate Hill."

Q. 5. When did you move away from there, and where did you move to?

A. I left "Slate Hill" the 19th of November, 1874, and moved down the Lisburn road into old Johnny Strong's house.

Q. 6. How long did you remain there?

A. Four years, and from 19th of November to April 1st over the four years.

Q. 7. Did you ever visit the shop in which Daniel Drawbaugh worked, at Eberly's Mills?

A. I did, in the spring after I moved down. He had got some potatoes from me.

Q. 8. At what time in the year 1875 was that?

A. I could not exactly tell, but it was between spring and haymaking, before the new potatoes came.

Q. 9. Am I right in saying 1875?

A. Yes, sir; in 1875, in the spring, was the time he got the potatoes.

Q. 10. Where were those potatoes raised?

A. On Slate Hill.

Q. 11. Before you moved away from there?

A. Yes, sir.

Q. 12. Did you ever see any talking-machines at his shop, and, if so, when did you first see them?

A. Yes, sir; I did, the day that I took them potatoes down.

Q. 13. Who showed them to you?

A. Mr. Daniel Drawbaugh.

Q. 14. Do you remember the appearance of any of them?

A. He gave me a thing to hold to my ear. I guess I would know it.

Q. 15. Did it resemble any of the machines now before you on the table?

A. I think it was that thing [taking up instrument "A"]. I am pretty certain it was that thing.

Q. 16. Where was it when you first saw it?

A. It was—he had it up in a corner of his shop, and this here thing ["A"] was laying on a table, and he said that he would go in the cellar, and I should hold this at my ear, and he would talk to me.

Q. 17. On what floor of the shop were you when he told you this?

A. On the first floor from the cellar up. It would be the second.

Q. 18. Did he go down stairs and talk to you?

A. Yes, sir.

Q. 19. Did you hear and understand what he said?

A. Yes, sir.

Q. 20. Do you remember now what he said?

A. No, sir.

Q. 21. Did you see any wires in connection with the instrument which you held to your ear?

A. Yes, sir; there was.

Q. 22. Did he say whether or not he could use the machine for talking at longer distances than from floor to floor of the same house?

A. Yes, sir; he said it could be made that you could talk to New York.

Q. 23. Did you go down into the cellar to see the instruments into which he spoke?

A. No, sir; I did not.

Q. 24. Could you have heard and understood what he said, except through the instrument?

A. I don't suppose that I could.

Cross-examined by Mr. Smith:

Cross-Q. 25. How long did he talk to you through the instrument?

A. I couldn't tell; not long, at all.

Cross-Q. 26. Was that the only time you were ever at his shop?

A. I was there frequently afterwards.

Cross-Q. 27. How often, do you think?

A. I don't know. I was there different times collecting road tax in the shop.

Cross-Q. 28. How far did you live from him when you lived at Johnny Strong's house?

A. About two miles, as near as I can tell.

Cross-Q. 29. Were you ever in his shop when you lived at Slate Hill?

A. Yes, I was.

Cross-Q. 30. How often?

A. I couldn't tell you.

Cross-Q. 31. How far did you live from him when you lived at Slate Hill?

A. Two miles and a half.

Cross-Q. 32. How far do you live from him now?

A. I suppose about two and a half; I couldn't exactly tell.

Cross-Q. 33. Did you ever see that talking-instrument again, or any others, at any of your visits to Drawbaugh's shop after that time?

A. Only the one time that I saw it.

Cross-Q. 34. Did you ever speak to him again about it?

A. No, sir.

Cross-Q. 35. Did you see any other talking-instruments at that time, except the one which you indicated?

A. Not that I can recollect.

Cross-Q. 36. What business was being done in the shop at that time?

A. I couldn't exactly tell you.

Cross-Q. 37. Did you ever see any business carried on in that shop after that time?

A. Yes, sir.

Cross-Q. 38. Do you know what business was carried on in that shop while you lived at Slate Hill?

A. No, sir; I don't know what.

Cross-Q. 39. Did you ever see any electric clocks in Drawbaugh's shop, or clocks that were intended to run without winding up?

A. I seen clocks there.

Cross-Q. 40. When did you see them there?

A. I could not just tell.

Cross-Q. 41. Did you ever see any faucet manufacturing carried on there?

A. I seen them making some there—working.

Cross-Q. 42. When was that?

A. A few years ago.

Cross-Q. 43. What do you mean—two or three years ago, or eight or ten years ago?

A. Two or three years.

Cross-Q. 44. How often were you there when they were carrying on the faucet business?

A. I couldn't tell, hardly. Once or twice, I believe.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 11th day of May, 1881.

NORMAN W. KAHNY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. I am twenty-three years of age; live at White Hill, Cumberland county, and am a laborer.

Q. 2. How long have you lived at White Hill?

A. Two years.

Q. 3. Where did you reside before you went to White Hill?

A. About one half mile west of Milltown.

Q. 4. When did you move to that last-named location?

A. Six years ago.

Q. 5. Am I to understand, then, that you moved to half a mile from Milltown some time in the year 1875?

A. No, sir; I did not.

Q. 24. Could you have heard and understood what he said, except through the instrument?

A. I don't suppose that I could.

Cross-examined by Mr. Smith:

Cross-Q. 25. How long did he talk to you through the instrument?

FRED. M. OTT,
Examiner.

HENRY M. DARR.

NORMAN W. KAHNY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abrahum:

Q. 1. State your age, residence, and occupation.

A. I am twenty-three years of age; live at White Hill, Cumberland county, and am a laborer.

Q. 2. How long have you lived at White Hill?

A. Two years.

Q. 3. Where did you reside before you went to White Hill?

A. About one half mile west of Milltown.

Q. 4. When did you move to that last-named location?

A. Six years ago.

Q. 5. Am I to understand, then, that you moved to half a mile from Milltown some time in the year 1875?

A. Yes, sir; the spring of 1875.

Q. 6. While there, did you become acquainted with Daniel Drawbaugh, of Eberly's Mills?

A. No, sir; not while there.

Q. 7. Are you acquainted with him at all?

A. Yes, sir.

Q. 8. How long have you known him?

A. Ten years.

Q. 9. Where did you live when you first became acquainted with him?

A. At Milltown.

Q. 10. When did you first reside at Milltown?

A. In 1871.

Q. 11. Did you ever visit the shop in which Daniel Drawbaugh worked, at Eberly's Mills?

A. Yes, sir.

Q. 12. Did he, at any of those visits, show you instruments which he called talking-machines?

A. He did.

Q. 13. When was the first time he showed you those instruments?

A. I think in 1872.

Q. 14. Did he tell you what he accomplished by means of the instruments shown to you?

A. Yes, sir.

Q. 15. Please state what he told you, so far as your memory serves you.

A. He told me he was able to talk to any person, to any distance with them, through that machine.

Q. 16. Would you be able to recognize the instruments he showed you at that time, if they were showed to you now?

A. I think not definitely.

Q. 17. Did he talk through them to you on that occasion?

A. No, sir.

Q. 18. Can you name any particular distance to which he said he could speak by means of these instruments?

A. Yes, sir.

Q. 19. State what he said in respect to distance.

A. He said he could just as easy speak ten miles as one, or any distance he would choose to.

Q. 20. Did he tell you by what means or principle his talking-machines were operated?

A. No, sir; not at that time.

Q. 21. After your visit in 1872, when Mr. Drawbaugh showed you his talking-instruments, when did you next visit his shop?

A. I could not say when I next visited it.

Q. 22. Did you visit him in the same year again?

A. I may have.

Q. 23. Did you visit him in 1873?

A. No, sir.

Q. 24. Did you visit him in 1874, '5, or '6 at his shop?

A. Yes, sir; in 1875 and '6.

Q. 25. At these later visits, did Mr. Drawbaugh show you ing-machines again?

A. Yes, sir.

Q. 26. Did he then tell you how they were operated?

A. Yes, sir.

Q. 27. Please tell us all he said in reference to his talking-machines.

A. He said that the machine was operated by electricity—by a battery. He said that he intended to try them, to put them on test from his shop along the creek. He said—he spoke of running a line, and get a man from Mechanicsburg to go in partners with him to have the thing patented. That is about all I can remember that was talked at that time.

Q. 28. During these visits, in 1875 and 1876, have you, in your memory, any special one in view?

A. Yes, sir.

Q. 29. Did he, at that special visit, ever speak to you by means of his talking-machines?

A. Yes, sir.

Q. 30. What part of the building were you in at that time?

A. In an office in the lower end of the building, next to the creek.

Q. 31. Please examine instrument "A," now shown you, and state whether you ever saw it before.

A. I think I did.

Q. 32. When did you see it?

A. In 1876.

Q. 33. Did the special visit that you have been testifying to occur in the year 1876?

A. Yes, sir.

Q. 34. Who showed it to you?

A. Daniel Drawbaugh.

Q. 35. Did he or you use it in any manner during that interview?

A. Yes, sir; I used it.

Q. 36. State how you used it.

A. By holding it to my ear.

Q. 37. When you held it to your ear, what happened?

A. I heard Mr. Drawbaugh speak.

Q. 38. Did you hear him speak through the instrument?

A. Yes, sir; the sound came from the instrument.

Q. 39. Where was Mr. Drawbaugh at the time?

A. I cannot say where he was.

Q. 40. Was he in the same room with you?

A. No, sir.

Q. 41. Before he left you, did he tell you where he was going?

A. Yes, sir; he said he was going down to talk through the machine.

Q. 42. Did he tell you what to do with this instrument "A"?

A. Yes, sir.

Q. 43. What did he tell you to do with it?

A. Hold it to my ear.

Q. 44. When you held it to your ear and heard speaking through it, did you recognize the voice as being that of Daniel Drawbaugh?

A. Yes, sir.

Q. 45. When he left you to go down stairs, did you hear his footsteps along the room and down the stairway?

A. I don't remember.

Q. 46. Do you remember what time of the day this special interview took place?

A. Yes, sir; it was in the evening.

Q. 47. Did you see by means of the moon or artificial light?

A. By artificial light.

Q. 48. What light had you?

A. An oil lamp.

Cross-examined by Mr. Smith:

Cross-Q. 49. Did you go to Mr. Drawbaugh's shop any after 1876?

A. Yes, sir.

Cross-Q. 50. How often, and during what years?

A. Frequently, to the present time.

Cross-Q. 51. Did he tell you who the man was at Mechanicsburg that he proposed to have go into partnership with him?

A. I do not know.

Cross-Q. 52. What did he say about this instrument ["A"] when he showed it to you?

A. He told me to hold it to my ear, and I would hear him talking to me.

Cross-Q. 53. Is that all that he said about it?

A. Yes, sir; all he said about this instrument.

Cross-Q. 54. Did he say anything about other instruments?

A. He said he had an instrument attached to the other end.

Cross-Q. 55. Did he tell you what it was, or did you see it?

A. He told me it was an instrument through which he would talk at the other end. I did not see it.

Cross-Q. 56. Did you ever see a line of wire running out from his shop along the creek?

A. Not for the talking-machine, I didn't.

Cross-Q. 57. If you saw it for any other purpose, what was the purpose and when was it?

A. I saw wires—I don't know for what purpose. They were just common telegraph wire. What they were for, I don't know. I don't know when it was. I suppose they are there yet, perhaps.

Cross-Q. 58. Did you ever see the instrument "A" after 1876?

A. I may have seen it.

Cross-Q. 59. Do you think you saw it at any of your visits to Drawbaugh's shop after 1876?

A. I may have seen it there.

Cross-Q. 60. Did you, at any of those visits after 1876, see any other talking-instruments there?

A. I may have seen other instruments, but don't know whether they were for talking or not.

Cross-Q. 61. Did you ever talk with Mr. Drawbaugh after 1876 about this talking-machine?

A. Yes, sir.

Cross-Q. 62. When and where?

A. I don't remember when. It was at his shop.

Cross-Q. 63. What did he say about them?

A. I don't remember what he said.

Cross-Q. 64. Have not you any recollection at all of what he said at those subsequent times?

A. No, sir; I have not.

Cross-Q. 65. Do you remember whether he said anything about patenting them or putting them into use at those times?

[*Objected to by Mr. Abraham for the reason that the witness has twice stated that he cannot recollect the conversation now again inquired about.*]

A. No, sir; not after 1876.

Cross-Q. 66. Do you remember what business was carried on at Mr. Drawbaugh's shop after 1876 down to 1880?

A. I remember some.

Cross-Q. 67. What do you remember seeing done there during those years?

A. They were manufacturing clocks there, and faucets, that I remember since that time.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 11th day of May, 1881.
FRED. M. OTT,
Examiner.

NORMAN W. KAHNY.

Adjourned until 9.30, A. M., May 12th.

May 12, 1881, 9.30, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Smith for complainants, and Mr. Jacobs and Mr. Abraham for respondents.

WILLIAM EPPLEY, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. My age is between fifty-one and two; residence, Cumberland county, Pa.; farming is my occupation.

Q. 2. Are you acquainted with Mr. Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. About twenty years I have been personally acquainted with him.

HONE COMPANY,-1

Q. 3. Did you ever visit him at the place where he has been working, commonly known as the clover-mill, at Milltown, or Eberly's Mills?

A. I have.

Q. 4. State when you last visited him there.

A. I visited at his place in May or June, 1875.

Q. 5. Was that the last time you were at his place?

A. To the best of my knowledge, it was.

Q. 6. How often were you there for the two years prior to May or June, 1875?

A. That I could not say how often I was there. I was there several times during that period from 1873 to 1875; how often, I could not tell.

Q. 7. During your visits from 1873 to 1875, did Mr. Drawbaugh ever show you any instruments he called talking-machines?

A. Yes, sir.

Q. 8. Did he explain them to you?

A. Yes, sir; he explained it to me, what he had intended it for.

Q. 9. What did he say to you about his talking-machine?

A. He told me it was to take the place of telegraphing.

Q. 10. What did he tell you about his operating his machine?

A. He told me that he had tried it on wires that he had strung for several miles on fences or trees, I forget which, to see how far he could carry the sound distinctly—that he was operating on that.

Q. 11. Did he say from whom he had procured that wire, and what description of wire it was?

A. He told me that he had got—still, I am not positive—from Mr. Gorgas, common fencing wire, that he used to use some years ago. Mr. Gorgas had used it for fencing wire

Q. 12. Have you in your mind any special visit when the above conversations took place between you and Mr. Drawbaugh relative to his using miles of wire in connection with his talking-machine?

A. No, sir; I can't give you any particular date, only it was between those two dates.

Q. 13. Do you recollect any particular business that took you down to Mr. Drawbaugh's establishment about that period, concerning which you have testified?

A. No, sir; I don't.

Q. 14. Do you know what kind of business or work was going on in his shop when you had this conversation relative to the talking-machine?

A. There was—part of the time that I was visiting there, there was no other work going on in the shop; that is, in the early part. I don't remember of anybody working there until Kline and Bear got in with their spindle business. That was in 1875.

Q. 15. Did Mr. Drawbaugh show you his talking-instruments or explain his talking-machines to you on more occasions than one?

A. I don't remember more than one occasion.

Q. 16. Please examine instruments "B" and "F" now shown you, and state whether you ever saw them at Mr. Drawbaugh's shop.

A. I couldn't say positive whether I saw these or not. I saw instruments there, but it is so long that I could not really make it positive whether these were the ones or something similar to them.

Q. 17. Do I understand you to say that Mr. Drawbaugh exhibited to you some instruments that he called his talking-machines—similar to "B" and "F"—but, from the lapse of time, you are unable, positively, to identify these as the identical ones?

A. Yes, sir. He showed me instruments that he had used for that purpose. I could not say whether they were just similar to those or not, altogether. Of course, those machines that he had were used for that purpose—for his operating—to get the sound on the wire. He told me so. Of course, I did not see him operating at all.

Q. 18. Please examine instrument "A," and state whether you saw that, or one similar to it, at Mr. Drawbaugh's place.

A. That I could not say, positively, that I saw this there, or not. It may have been laying on his desk—on his bench, rather—with his other tools and fixtures there. He had something similar to this laying there.

Cross-examined by Mr. Smith:

Cross-Q. 19. How near is your residence to Mr. Drawbaugh's shop?

A. About three miles.

Cross-Q. 20. How long have you lived at that place?

A. I have been living there sixteen years.

Cross-Q. 21. How often did you visit his shop before 1873?

A. I could not say how often.

Cross-Q. 22. Could you say whether you generally went there a half-dozen or a dozen times a year?

A. No, sir; I could not say. I did not go that often there.

HONE COMPANY,-1

Cross-Q. 23. Have you told us all that he said to you about his talking-machines?

A. All that I remember of clearly at the present.

Cross-Q. 24. How often have you seen Mr. Drawbaugh anywhere since 1875?

A. That I could not say how often. I have met him on the way back and forward to the city here—Harrisburg; but not so often.

Cross-Q. 25. Do you come through Eberly's Mills in coming to Harrisburg?

A. No, sir.

Examination taken, reduced to
writing, and by the witness affirmed
and subscribed to before me, this
12th day of May, 1881.
FRED. M. OTT,
Examiner.

WM. EPPLEY.

Adjourned until Saturday, May 14, 1881, at 9.30, A. M.

[*The examiner is requested to note that the frequent handling of instruments marked "B" and "F" causes some of the plaster interlining to scale off and fall out.*]

Saturday, May 14, 9.30, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Jacobs for respondents.

HENRY B. EBERLY, *being produced, sworn, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. My age will be thirty-one on the 14th of June; residence, Williamsport, Penn'a.; my occupation is book-keeping.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. I have known Daniel Drawbaugh from my infancy, I suppose.

Q. 3. How long have you resided in Williamsport?

A. Since May, 1873.

Q. 4. What time in May?

A. It was May 27th when I left here and arrived at Williamsport.

Q. 5. Where did you reside immediately prior to that time?

A. With my parents, at Shiremanstown.

Q. 6. From what time?

A. I was away during one summer, but returned again in the winter. We moved to Shiremanstown from New Cumberland, I think, in December, 1870.

Q. 7. When did you move to New Cumberland, and from what place?

A. I think in the spring of 1867, from Eberly's Mills.

Q. 8. Have you ever been back to Eberly's Mills, or to Cumberland county, since you moved to Williamsport, on the 27th of May, 1873?

A. No, sir.

Q. 9. Please look at instruments marked "B" and "F," and state where you first saw them.

A. I saw these in his shop—in his office.

Q. 10. Whose shop?

A. That is where he worked—Daniel Drawbaugh.

Q. 11. When did you see it first?

A. It was some time before May 27, 1873.

Q. 12. Do you remember whether it was explained to you at the time?

A. He may have explained it to me, but I don't remember it now.

Q. 13. Prior to the time when you saw those instruments, had you heard him say anything about making a machine for speaking or hearing at a distance? If so, when and under what circumstances?

A. I do recollect of him speaking about attaching an instrument to the office, by which he could hear all that was going on at the mill-office, without leaving his house. He made this remark one Sunday in the mill-office, in company of we boys and a party that usually congregated in there. This was between 1861 and 1864; that is the nearest I can come at it; it was during the war.

Q. 14. What was the distance from the mill-office to his house?

A. I would suppose about forty feet.

Cross-examined by Mr. Storrow:

Cross-Q. 15. What were you and the other parties in the habit of congregating for at the mill-office on Sunday?

A. No other purpose, I don't suppose, than to spend the time.

Cross-Q. 16. What mill was that, and how near to Drawbaugh's shop?

A. It was my father's grist-mill. The office being built near the end, was, I suppose, twelve or sixteen feet further away than the mill from the house. It was about twenty feet from Drawbaugh's shop.

Cross-Q. 17. The mill and Drawbaugh's shop were common places of resort on Sundays, were they not?

A. Yes, sir; the mill more so than the shop.

Cross-Q. 18. The creek was a good place for fishing, and a good many people from Harrisburg and elsewhere were in the habit of going up there in fishing season, were they not?

A. Yes, sir.

Cross-Q. 19. When people were up there for fishing or pastime, it was very common for Drawbaugh to tell them about things he had invented and was going to make, or for the conversation to turn on him and what he had done, was not it?

[*Objected to by Mr. Jacobs as not proper cross examination.*]

A. It was common for him to tell me, and others in the town, but don't recollect of him telling fishermen that came there, as I was not always present.

Cross-Q. 20. Ever since you have known him, he has been looked upon by the community as a genius, who got up things that nobody else could make, and that other folks could hardly understand, was not he?

A. Yes, sir.

Cross-Q. 21. Around the neighborhood of that mill has been quite a place for picnic parties, has not it?

A. Not close to the mill.

Cross-Q. 22. What business was carried on at his shop along during the war?

A. He was working at his business of making machines, stave-jointers, stave-cutters, mill-tram, and other work in his line.

Cross-Q. 23. Were these things that he was making mostly things that he had invented and patented?

A. Yes, sir; all the machines mentioned there were his inventions.

Cross-Q. 24. I suppose he had machines to work with, such as lathes, and planers, and water-power to drive them, had not he

A. At that time I can only remember of him having one lathe, which was in the mill, and where he got the power.

Cross-Q. 25. The shop belonged to your father, Mr. Christian Eberly, I believe, did it not?

A. Yes, sir.

Cross-Q. 26. And still does?

A. No, sir; not now.

Cross-Q. 27. What business was carried on at the shop after the war?

A. He worked there. I don't remember what he was working at, except the molasses faucet.

Cross-Q. 28. How did you happen to be at the shop on the particular occasion when you saw "F" and "B," as you stated before?

A. Just as I would happen in.

Cross-Q. 29. Did you happen in there pretty often before you moved to Williamsport?

A. Yes, sir; quite often.

Cross-Q. 30. Who was present when you saw "F" and "B?"

A. I can't tell that.

Cross-Q. 31. When was it?

A. It was before we moved to New Cumberland, or about then. I can't remember the date.

Cross-Q. 32. When you saw them on this occasion, were they lying on a bench, or were they in a box, or how?

A. I can't tell where they were lying when I saw them.

Cross-Q. 33. Were they lying around somewhere in the office, or did he take them out of a cupboard or a box, somewhere, to show you?

A. I don't remember that, just now.

Cross-Q. 34. Were they lying together, when you saw them, or were they lying in different parts of the office?

A. I don't remember of seeing them lying at any one particular place.

Cross-Q. 35. Were they in just the same condition then that they are in now?

A. I think there was more to "B;" what more was to it I don't recollect any more. I don't think the bottom of "F" was broken.

Cross-Q. 36. What else did you see in the office at this time, in the way of machines or things that Drawbaugh had made?

A. I can remember of a model of his nail-feeder. I can't call to mind the others.

Cross-Q. 37. Did not you see some magnetic clocks in his office at this time?

A. He was working at electric clocks, but can't say if it was before 1866.

HONE COMPANY,-1

Cross-Q. 38. On the occasion when you saw "F" and "B," did not you see some electric clocks?

A. No, not that I remember; that was before 1865. I can't remember seeing any before that time or 1866.

Cross-Q. 39. I understand from your answer that it was somewhere about 1865, or not later than 1866, that you first saw "F" and "B." Am I right in that

A. I think it was about that time.

Cross-Q. 40. What story of the shop was the office in when you saw "F" and "B" there?

A. I saw these at different times; I can't say the exact time in either shop. He moved away from the shop he did occupy behind the mill, I think in the spring of 1867, to the one down on the creek. I was at school at the time.

Cross-Q. 41. Which of these shops does he occupy now?

A. I don't know; I have not been there to see.

Cross-Q. 42. You testified in your eighth answer that you had not been back to Cumberland county since you moved to Williamsport, in 1873. Do you mean that you have never been to Cumberland county in all these eight years?

A. Yes, sir.

Cross-Q. 43. How far is Williamsport from Cumberland county?

A. I suppose it is nearly one hundred miles.

Cross-Q. 44. Has your father lived in Cumberland county during these eight years?

A. Yes, sir.

Cross-Q. 45. Whose employment did you go into when you first went to Williamsport?

A. I was policy-writer in the Mutual Life and Accident Insurance Company of Pennsylvania.

Cross-Q. 46. How long did you stay with them and whom did you go to next?

A. About four years and a half. After that, was engaged in keeping books, but for no particular persons, until about the middle of August, 1878, when I was employed by A. H. Heilman & Co., furniture dealers, as book-keeper, and am now with them.

Cross-Q. 47. Where is their place of business in Williamsport?

A. Third street.

Cross-Q. 48. Where do you live in Williamsport?

A. I board at the Central hotel, so-called, Fourth street. It is no hotel; it is a boarding-house.

Re-direct by Mr. Jacobs:

Q. Q. 49. In what shop was Daniel Drawbaugh working between 1861 and 1864, during the war?

A. In the shop behind the mill, as we always called it.

Q. Q. 50. Did he remove to the shop on the creek before or after the old faucet company, composed of William R. Gorgas, Henry S. Rupp, Samuel M. Hertzler, and others, went into operation?

A. He removed after that. He went with them.

Re-cross by Mr. Storrow:

Re-cross-Q. 51. I understand you to mean, then, that that company first made faucets at his shop by the mill; and after they had established the business of manufacturing his faucet there, he and they moved their business to another building. Is that what you mean?

A. I don't know as they ever made faucets at the office behind the mill—by this company.

Re-cross-Q. 52. Then you mean to say that he moved before they began to manufacture faucets, do you?

A. I mean to say that, when this company was formed, the way that I understood it, Daniel Drawbaugh devoted his time and attention to putting up the machines, and getting the business of making faucets started.

Re-cross-Q. 53. And do you mean that this machinery was put up for that purpose, not in the office behind the mill, but in another building, and that this company manufactured the faucets, not in the office behind the mill, but in that other building where the machinery was put up?

A. Yes, sir; but we never called the shop behind the mill an office.

Examination taken, reduced to
writing, and by the witness sub-
scribed and sworn to before me,
this fourteenth day of May, 1881.
FRED. M. OTT,
Examiner.

H. B. EBERLY.

Daniel A. Hamacher, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. Twenty-nine years; Shiremanstown, Cumberland county; school teacher.

Q. 2. Where do you now teach?

A. At the Gorgas, or Cedar Hill, school-house, Lower Allen township.

Q. 3. How far from Eberly's Mills?

A. By the road it is about a fourth of a mile, as near as I can tell.

Q. 4. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penn'a? If so, how long have you known him?

A. I have known him since the first day of February, 1876.

Q. 5. How did you become acquainted with him?

A. By going to his shop.

Q. 6. With whom did you go, and under what circumstances?

A. I went with a number of my pupils: John F. Rupp, David C. Rupp, Solomon S. Rupp, Forrest Shank, and a number of others. We went to visit Mr. Strong's school. He was teaching at the Cedar Hill, or Gorgas school, and we remained there until the middle of the afternoon, for the purpose of seeing the machines he was working on.

Q. 7. The machines who was working on?

A. Daniel Drawbaugh.

Q. 8. Am I to understand that you went to the shop of Daniel Drawbaugh for the purpose of seeing those machines?

A. Yes, sir.

Q. 9. How do you fix the date?

A. On the last of January and the first of February, they were putting new desks and furniture in the house in which I taught—the Cedar Run school, Lower Allen township.

Q. 10. How are you able to fix these two days?

A. From the book of the secretary of the Lower Allen school board, and from my own report given to the directors, and also the report book at the Cedar Hill school.

[*Answer objected to by Mr. Storrow, unless all the writings referred to are produced.*]

Q. 11. Have you examined any or all of these reports recently, for the purpose of fixing the date?

[*Question objected to as above.*]

A. Not the secretary's, recently. The report-book of the Cedar Hill school has been in the school-room in which I taught for the last three consecutive winters; I used it. The other books I will bring, if I can get possession of the secretary's book. The two report-books I can get.

Q. 12. Please state whether or not, upon the visit to the shop of Daniel Drawbaugh, referred to, you saw there any talking-machines?

A. I did.

Q. 13. Please look at the instruments now before you on the table, and pick out from among them, if you can, any that you remember of seeing then and there?

A. Here is the machine [taking up "A"] that Mr. Drawbaugh showed me, or one similar to it.

Q. 14. Did you see any other talking-machines there that you do not now identify?

A. I saw a number of talking-machines.

Q. 15. Did he explain them, or any of them, to you at the time?

A. Yes, sir.

Q. 16. Did he tell you what they were for? If so, please state, as nearly as you can, what he said about them?

A. He said they were used to convey words by means of electricity.

Q. 17. Did he say how far?

A. He said the time would come that you could speak to San Francisco.

Q. 18. Did he make any comparison between his talking-machines and the telegraph?

A. He thought the talking-machine would take the place of the telegraph.

Q. 19. Do you remember his having any instrument there at that time for telegraphing?

A. Yes, sir.

Q. 20. Did you see it before or after you saw the talking-machines?

A. Before.

Q. 21. Did you have any conversation with him with regard to the instrument for telegraphing and the talking-machines? If so, please state what it was—what you said to him and what he said to you?

A. I asked him why he did not get the telegraph patented. His answer was "the telephone will take its place." He used the word speaking-machine. I have got the two words mixed.

Q. 22. Did he then show and explain to you the spe king-machine?

A. He did.

Q. 23. How old were the pupils who were with you?

A. Their ages may have been from thirteen to nineteen, as near as I can tell.

Q. 24. When did you next visit that shop?

A. In the beginning of the year 1879.

Q. 25. Did you then see talking-machines there? If so, were they the same which you had seen in 1876, or others?

A. They were different. I saw them—they were different.

Q. 26. Among those before you on the table, can you pick out any which you saw at that visit in 1879, and which you had not seen at your former visit?

A. There was one similar to this ["H,"] I saw in the spring, or beginning of the year, 1879. I saw this machine ["J"] in his shop, but I can't fix the date. I saw other machines in 1879, besides those two, but can't identify them.

Recess for dinner until 12.15, P. M.

May 14, 1881, 2.30, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Q. 27. Can you give any idea of the other instruments which you saw at Drawbaugh's shop at that visit in 1879? What was their general appearance, size, shape, material of which they were made, &c.?

A. I cannot describe them.

Q. 28. Do you remember whether they were large or small?

[*Objected to on the ground that the witness' memory has already been exhausted.*]

A. I can't say.

Q. 29. State whether or not you made any visits to Drawbaugh's shop between the time of the visit last referred to and the middle of the year 1880?

A. I visited the shop frequently after that.

Q. 30. Did you, during those visits, see any new talking-machines which you had not seen at either of the former visits which you have already testified about?

A. I did.

Q. 31. State whether or not, during either of those years, Daniel Drawbaugh talked to you through any of the machines; and, if so, when it was, as nearly as you can recollect.

A. In the spring term of 1879, I taught a summer-school there, and between the beginning of the term (about the first of April) and the—towards the middle of June, Mr. Drawbaugh said, through the speaking-machine, "How is the school getting along?" He asked me those words.

Q. 32. Where was the instrument into which he talked, and where was the instrument at which you listened?

A. The instrument in which he talked was in the south-east corner of the third floor; the machine at which I listened was in the north-west corner of the second floor.

Q. 33. Was the instrument at which you listened large or small?

A. It was larger than this one ["K"]; it was smaller than this one ["J"].

Q. 34. Was the instrument into which he spoke large or small?

A. It was similar to the one at which I listened.

Q. 35. Had you seen either of those machines at any of your former visits?

A. Not to my recollection. They were apparently new.

Q. 36. Did he tell you, during those years—during 1879 or the first half of 1880—whether or not he was still working upon the talking-machines and improving them?

A. He did not tell me directly that he was improving the machines.

Q. 37. What did he tell you on that subject, if anything, as nearly as you can recollect?

A. I cannot remember what he said. He had machines, and was always anxious to show them.

Q. 38. During that time, did he show you new machines once, or more than once?

A. As I stated before, the machines were apparently new. I saw the machines, during the time stated, frequently.

Q. 39. Please state whether, during that time, he showed you any other instruments which were new, or apparently new, than those through which he spoke to you in the spring of 1879?

A. I cannot say.

Q. 40. Do you know what were the financial circumstances of Daniel Drawbaugh during the year 1879, and the first half of 1880?

A. Only so far as I had dealings with him.

Q. 41. Please state what those dealings were, and how far, by them, you were enabled to know anything about his financial circumstances.

A. That is a delicate question. During the spring term of 1879 and the spring term of 1880, I taught school at the Cedar Hill, or Gorgas, school-house. Mr. Drawbaugh sent his children to me to school, and, also, I purchased some books for those children, and it was a great deal of trouble to collect the money. I did not get it until the beginning of September, of the fall of 1880. I gave it to a constable to collect—Mr. A. B. Shank was the constable. He collected the money. Amount of all, books and tuition, thirteen dollars and odd cents.

Q. 42. Did you ask him for it frequently?

A. I would go to the shop, and he would generally talk about the matter himself, and say he had not the money to pay me.

Q. 43. When did you last ask him for it, if at all, before putting it into the hands of the constable?

A. At the close of the spring term of 1880, near or about the middle of June.

Q. 44. Before you took his children into your summer school, did you have any conversation with him upon the subject of payment? If so, what was that conversation?

A. Nothing more than to make known in the district that, at the close of the session, I expect my pay.

Q. 45. My question relates to any conversation which you may have had with Daniel Drawbaugh before taking his children into your school.

A. Nothing direct, only what I would charge for the term.

Cross-examined by Mr. Storrow:

Cross-Q. 46. When was it that you went to Drawbaugh's shop the first time?

A. In the year 1876, on the first of February.

Cross-Q. 47. What induced you to go there then?

A. To see the machines on which he was working.

Cross-Q. 48. How did you know he was working on any machines?

A. It was the general talk in the community.

Cross-Q. 49. What machines did you hear talked about in the community?

A. The clock; the speaking-machine. These are all that I remember particularly.

Cross-Q. 50. Who had told you about the clock and speaking-machine before you went there?

A. One of my pupils, John F. Rupp, was studying natural philosophy at the time, and we spoke frequently about going to see the clock and other machines which were worked by electricity.

Cross-Q. 51. What text-book on natural philosophy did he study?

A. Cooley's Elementary, or First Book.

Cross-Q. 52. How many magnetic clocks did you see at Drawbaugh's shop on this occasion?

A. I saw one that was going.

Cross-Q. 53. Did you see any that were not going?

A. I saw the works of several.

Cross-Q. 54. Were any of these in cases, or were their works all exposed?

A. I am not able to say whether there was a case to inclose the clock that was in operation, or not. There was no face on the clock.

Cross-Q. 55. I understand, from your testimony, that you did not hear the talking-machine talk on that occasion, did you?

A. I did not.

Cross-Q. 56. I suppose you asked him to have it talk for you, did not you?

A. I did not.

Cross-Q. 57. Did not he offer to have it talk for you?

A. Not to my recollection.

Cross-Q. 58. Why did not he use it for you?

A. I can't say.

Cross-Q. 59. Did he tell you how the instrument "A" was to be used?

A. Speak into the tube, and, by means of electricity, it was to convey the word or sound.

Cross-Q. 60. Was there to be another machine at the other end for a man to listen at?

A. By what I could infer from his conversation, there was.

Cross-Q. 61. Did you see that other machine?

A. I saw other machines. I cannot identify them.

[*During the examination, the witness has had before him on the table all the instruments that have been exhibited in the case, except "C" and "I."*]

HONE COMPANY,-1

Cross-Q. 62. How near to Drawbaugh have you lived since 1876?

A. As near as I can tell, between two miles and a half and three miles; I can't tell the distance exactly.

Cross-Q. 63. How near to Eberly's Mills is your school-house?

A. About one fourth of a mile.

Cross-Q. 64. Did you ever go to his shop between the spring of 1876 and the spring of 1879?

A. I did not.

Cross-Q. 65. Did you ever see him anywhere during that interval?

A. I did.

Cross-Q. 66. Did you ever have any conversation with him, during that interval, about his talking-machine?

A. Not to my recollection.

Cross-Q. 67. I suppose his general repute in the community was that he was always trying to get up some new thing to patent it, was not it?

A. Well, he was spoken of as a great inventor.

Cross-Q. 68. Did you see any manufacturing business going on at his shop at any time? If so, what?

A. I saw them work on clocks, but the date I can't fix. Some time after 1879—the last year, now—of 1880 and 1881. The latter part of 1880, I think, he began to manufacture faucets and the water-motor.

Cross-Q. 69. What kind of manufacturing business was being carried on there at the time when you saw "A"?

A. I saw nothing particularly, to my recollection, except the drawings of his clock, and the speaking-machine, and the telegraph. I saw the machines, too, as I stated before. There was no work carried on.

Cross-Q. 70. Which story did you see "A" on?

A. The third.

Cross-Q. 71. A telegraph you saw there had a dial and letters around it, and a pointer to spell out words, had not it?

A. Yes, sir.

Cross-Q. 72. Did he give you to understand that that was an idea of his own invention?

A. Not to the best of my knowledge.

Cross-Q. 73. I thought you said something in your direct examination about getting a patent on his telegraph.

A. I spoke to him about patenting the telegraph, and he said that the telephone—(speaking-machine he called it at that time)—would take its place.

Cross-Q. 74. When you spoke to him about patenting this telegraph, was it because you had understood from him that it was his invention, or why did you suppose that he would patent it?

A. I could infer nothing direct that it was his invention, but seeing it there, I wondered why he did not get it patented.

Cross-Q. 75. I suppose he opened the talking-machines and showed you the insides of them so that you knew how they were constructed, did not he?

A. He did not.

Cross-Q. 76. Do you know whether the inside of "A" is to-day just what it was at the time you saw it?

A. I am not positive for the inside. This [indicating electro-magnet of "A"] is the same, or constructed the same, and this tube [mouthpiece of "A"] is the same.

Cross-Q. 77. You testified in your twenty-second answer that he explained his talking-machine to you. Please to state what the explanation was that he gave you.

A. He explained the manner of conveying the sounds, principally.

Cross-Q. 78. Please state what that manner was.

A. By electricity.

Cross-Q. 79. How was the electricity to work or to operate?

A. I am not able to explain the theory.

Cross-Q. 80. Please to repeat the explanation that he gave you, or give us the substance of it.

A. I cannot explain the principle as he did.

Cross-Q. 81. Was the instrument at which you listened, in 1879, any one of those before you on the table? If so, which one?

A. I stated before I could not identify the machine particularly.

Cross-Q. 82. I suppose that before you went there in 1879, you knew that electric speaking-telephones were in general public use in the community, did you not?

A. I read of them.

Cross-Q. 83. Did you, at any time, talk with Drawbaugh about their being in general use in the community?

A. Nothing more than he said that they would take the place of the telegraph.

HONE COMPANY,-1

Cross-Q. 84. Did you ever talk with him about the fact that you had seen in the papers that they were in general use in the community?

A. Never talked directly about the use of them in the community, more than as stated above.

Cross-Q. 85. At the time when you had the conversation, which you referred to as the one stated above, was that before or after you had been reading something about the use of the telephone in the newspapers?

A. It was in 1876, the time I saw the first speaking-machine.

Cross-Q. 86. Had you, or had you not, before that, read something in the newspapers about the speaking-telephone?

A. Not to my recollection.

Cross-Q. 87. When did you last see instrument "A", before to-day?

A. I saw a number of them last winter some time, in 1880 or the beginning of 1881, I am not able to say; among them was "A".

Cross-Q. 88. Where did you see them then, and who showed them to you?

A. I saw them in the school-room. They were shown by Mr. Jacobs, 'Squire Bowman, and Daniel Drawbaugh.

Cross-Q. 89. Did you make an affidavit then about it?

A. I did.

Cross-Q. 90. You say that he showed you his talking-machine in 1879, and said some words through it at the time you went there to dun him. He had rather a habit of showing his contrivances and talking a good deal about what he was going to do with them to people who went there to dun him, had not he?

A. He took delight in showing his inventions.

Cross-Q. 91. I suppose it occurred to you when you were dunning him that, while his children were going to school, he had put money enough into these instruments now on the table, and others you saw, to pay your bill several times over, did it not?

A. I thought he might pay me, but he claimed the money was in these things and that he was trying to get it out. That was his expression the last time I saw him.

Cross-Q. 92. And, I suppose, he wanted you to wait till he could get it out?

A. I took him to be an honest man, and he always appeared to be hard up. That is why I waited on him as long as I did.

Cross-Q. 93. Who have you talked with among your neighbors, since the beginning of 1876, about Drawbaugh's talking-machine?

A. That is a question I cannot answer. I have spoken to different parties.

Cross-Q. 94. Can't you remember any of them?

A. I spoke to a number of the pupils of my school, especially those who were with me.

Cross-Q. 95. When was that?

A. After we had visited the shop the first time in 1876.

Cross-Q. 96. How soon after?

A. On the way home, and during school time.

Cross-Q. 97. What did you tell them about it?

A. General talk among us. We thought it was a grand invention.

Cross-Q. 98. You did not know that it would talk then, except merely that Drawbaugh had told you that it would, did you?

A. No, sir, not in 1876.

Cross-Q. 99. When you say "we thought it was a grand invention," I suppose you mean you thought anything would be a grand invention which would do what Drawbaugh said this would do. Is that your meaning?

A. To convey the voice in the manner in which he explained that this would.

Cross-Q. 100. Did he state to you any particular distance which he said he had actually talked over before the spring of 1876?

A. He stated no distance prior to that time.

Re-direct by Mr. Jacobs:

Q. Q. 101. How far is Cedar Run school-house from Eberly's Mills?

A. Maybe two miles and a half on a direct line.

Q. Q. 102. And how far from Cedar Hill school-house?

A. Two miles and three quarters.

Q. Q. 103. How long did you teach at Cedar Run school-house, after the visit which you made to Daniel Drawbaugh's shop in 1876?

A. I finished my last term in 1878.

Q. Q. 104. And were you then transferred to Cedar Hill school-house?

A. I was not transferred. I took that school of my own will in preference to the one I was teaching.

Q. Q. 105. When?

A. In the fall of 1878.

Q. Q. 106. Were instruments "H" and "J" shown to you at the time your affidavit was taken, or at any time after the middle of last summer, up to to-day?

A. No, sir.

Q. Q. 107. How long before the visit which you made to Drawbaugh's shop, on February 1, 1876, did John F. Rupp tell you about Drawbaugh's talking-machine?

A. I cannot state how long. It was in the winter session of 1875-6, prior to February 1, 1876.

Adjourned until 10 o'clock, A. M., Monday, May 16, 1881.

Monday morning, May 16, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

Examination of Mr. Hamacher continued by Mr. Jacobs:

Q. Q. 108. In your answers to questions 10 and 11, you stated that you were able to fix the date of your first visit to Drawbaugh's shop by certain report-books. Have you with you any of those books? If so, what one?

A. I have the report-book of the Cedar Hill, or Gorgas, school.

Q. Q. 109. How long has that book been in your possession?

A. I have had this report-book in my possession from near the middle of September, 1878, until March 27, 1879, and for the two consecutive winters following, and since this morning up to the present time.

Q. Q. 110. Into whose possession has it passed from time to time when it went out of yours?

A. Into the hands of the secretary of the Lower Allen school-board.

Q. Q. 111. From whom did you receive it this morning?

A. From the secretary of the school-board.

Q. Q. 112. Please state whether, when it came into your possession from time to time, it came into your possession as the teacher of the Cedar Hill school, entitled and required by law to use it for the purpose of entering your monthly reports of the business of that school.

A. It did.

Q. Q. 113. Am I then to understand that it has, since it first came into your possession, been in the possession of either yourself or the secretary of the Lower Allen school-board, for the time being, in your several official capacities?

A. As far as I know, it has.

Q. Q. 114. State whether or not the teachers in the common schools of your township are required by law to enter upon their report-books the visits of school officers and others to their respective schools?

A. There is a certificate in the report book, which we are required to sign, stating that we have taken note of the progress of the pupils and their conduct; also, of the number of visitors, such as officers and others, who have visited the school during the months, and certify that we have done so to the best of our knowledge and belief.

Q. Q. 115. Are you required to enter such visits upon your books of reports?

A. We are.

Q. Q. 116. Please turn to the report upon the book, which you now produce, for the month of February, 1876, and state in whose handwriting that report is written and by whom signed?

A. Robert Strong was teacher at that time. I would suppose it to be his hand-writing, and also signed by him.

[*The examiner is now asked to certify that the book produced by the witness contains, for the lunar month ending February* 14, 1876, inter alia, *these entries*:]

VISITS.

	Feb'y.	Length.	Spec.
Mr. D. A. Hamacher,	1	¾	1
Mr. John F. Rupp,	1	¾	1
" Sol Rupp,	1	¾	
" Joseph Rupp,	1	¾	
" E. B. Bitner,	1	¾	
" Elmer Kauffman,	1	¾	
" F. Shank,	1	¾	
" Martin Best,	1	¾	
" J. Enck,	1	¾	
" Harry Weber,	1	¾	"

[*The above constitute about one third of the visitors for the entire month of February,* 1876, *to said school, but are all entered as of February* 1.]

PHONE COMPANY,-1

CERTIFICATE.

"I certify that the foregoing report of the number of scholars belonging to school since the first of June, attendance, books used, branches taught, progress and conduct of pupils, visits of school officers and others, and of the number of days the school was in operation during the past month and term, is just and true, to the best of my knowledge and belief.

"ROBERT STRONG,
"*Teacher.*"

"*February* 14, 1876."

APPROVAL.

"Filed, examined, and approved this 25th day of March, 1876.

"JNO. C. COMFORT,
"*Secretary.*"

Q. Q. 117. What does the fraction three fourths indicate?

A. It should indicate three fourths of a day.

Q. Q. 118. Is that the length of time, according to your recollection, that you and your pupils spent at Mr. Strong's school?

A. It is.

Q. Q. 119. What time in the day did you leave the school?

A. About, between two o'clock and the middle of the afternoon.

Q. Q. 120. Did you go directly from Mr. Strong's school to Mr. Drawbaugh's shop?

A. Yes, sir.

Q. Q. 121. How long did you remain at the shop?

A. It may have been an hour and a quarter.

Q. Q. 122. And during that time you were looking around at all that was to be seen there?

A. Yes, sir.

Q. Q. 123. I observe the name "Joseph Rupp" among the visitors mentioned in your report. Is that the correct name of any pupil who was along with you? If not, what other Rupp, besides John F. and Solomon, was with you?

A. David C. Rupp is the correct name of the pupil that was with us.

Q. Q. 124. Are the other names given correct?

A. All correct but Martin Best, who is a patron of the school and did not come with us.

AMERICAN BELL TELEPHON

Q. Q. 124½. Do you mean to say that he was there on that day, but was not one of your party?

A. I did.

Re-cross-examined by Mr. Storrow:

Re-cross-Q. 125. I now understand you to say that of the three books referred to in your tenth answer, the only one that gives you any information to help you fix the dates referred to is the report-book of the Cedar Hill school, which you have produced this morning. Is that so?

A. Yes, sir.

Re-cross-Q. 126. How much of the time that day did you pass at the school, and how much at Mr. Drawbaugh's shop?

A. In the neighborhood of three fourths of a day at the school, and it may have been one hour and a quarter, at the shop.

Re-cross-Q. 127. You speak of staying there until the middle of the afternoon. Do you mean that in the middle of the afternoon you left that neighborhood, and went home?

A. Went to the machine-shop.

Re-cross-Q. 128. Then do you mean to have us understand that you and your pupils spent the forenoon and the first half of the afternoon at the Cedar Hill school, and spent the latter part of the afternoon at Drawbaugh's shop?

A. We spent the forenoon and the first part of the afternoon, at the school-house, and in the latter part of the afternoon, say an hour and a quarter, at the machine-shop.

Re-cross-Q. 129. Don't you think you went to the machine-shop at noon, between the two sessions?

A. No, sir; we did not.

Re-cross-Q. 130. Which of your pupils went to the machine-shop with you?

A. They all left the school-room when I did, but I am not positive whether they were all in the machine-shop. J. F. Rupp, Forrest Shank, Solomon Rupp, and there may have been others, I am not positive—those mentioned were in the machine-shop.

Re-cross-Q. 131. I notice that you say Mr. Strong taught the Cedar Hill school, and that the report signed by him, which you have produced, says that it was the Cedar Spring school that he taught. Which of you two is it that don't know the name of that school?

HONE COMPANY,-1

A. I said it was the Cedar Hill, or Gorgas school. The proper name is the Cedar Hill school.

Re-cross-Q. 132. I notice that this book contains reports for several years of that school, each of them purporting to be signed by the teacher of the school and the secretary of the board, and that all those reports say that it was the Cedar Spring school that he was teaching at. I suppose you mean to have us understand that he and the secretary did not know the name of the school, do you?

A. There was a dispute arose in the year of 1877, in the fall of that year, on these grounds. The superintendent of the county had advertised for an examination at the Cedar Hill school, and some of the teachers, who were going to be examined by the superintendent, went to the Cedar Run and others to the Cedar Hill, and the superintendent decided, then and there, that the Gorgas school was the Cedar Hill school. That is why I used the word Cedar Hill or Gorgas house.

Re-cross-Q. 133. Does the whole of this report book apply to the same school-house?

A. It does. It is number two house all the way through.

Re-cross-Q. 134. I observe that it is sometimes called Cedar Spring, sometimes Cedar Run, and sometimes Cedar Hill school. I wish you would tell me what, on the whole, we are to consider the correct name?

A. As the Cedar Hill or Gorgas school.

Re-cross-Q. 135. I notice that some of the reports signed by you call it the Cedar Run school. I suppose at that time you had not made up your mind what the name was. Is that so?

A. I did not know positive at that time, but the proper name now is the Cedar Hill, or Gorgas, school. It is better known in the township by that name.

Re-cross-Q. 136. In your sixth and ninth answers, and in your hundred and first to hundred and sixth answers, you distinguish between the Cedar Hill and Cedar Run schools, and say that they are two miles and three quarters apart, and that you taught at Cedar Run school in 1876, 1877, and part of 1878, and then changed and took the Cedar Hill school in the fall of 1878. Is that statement true?

A. I taught at the Cedar Run, as it was then called, as above stated, and at the Cedar Hill, or Gorgas, house, as stated.

Re-cross-Q. 137. Then, I understand that the school you taught at till the fall of 1878 is the one you have called, in your examination on Saturday, the Cedar Run school-house, and is about two miles and a half from Eberly's Mills, and that, in the fall of 1878, you moved to what, in your examination day before yesterday, you called the Cedar Hill school, which is the school where you teach now, and which is about a quarter of a mile from Eberly's Mills. Is that correct?

A. The teaching is correct. I quit the Cedar Run school at the time stated, and took the Cedar Hill school.

Re-cross-Q. 138. To make it more clear, in consequence of this confusion of names, I will ask you whether, in the fall of 1878, you began to teach, and have ever since continued to teach, at the school at which Mr. Strong taught in 1876, and which, I understand you, is known as the Cedar Hill school. Am I correct?

A. Yes, sir.

Re-cross-Q. 139. And is it the reports of that school which constitute the book you have produced?

A. That is the report of the school since the fall of 1875 up to the spring of 1881.

Re-cross-Q. 140. In the report from which you quoted in your 116th answer, I do not find any record that school kept on Tuesday, the first day of February, 1876. I wish you would point out the entry in the attendance column to show that school was open on that day. Begin first, if you please, in the boys' half, and then go to the girls' half.

A. It is an error in his count there. I fix my date from this. If that is error, I have erred.

Re-cross-Q. 141. On the boys' page I find the days written, Monday, 31; Wednesday, 2; Thursday, 3; the period covered being the lunar month ending February 14. Is that the fact?

A. As I have got it by the book, as it states I must leave it.

Re-cross-Q. 142. Does the book state as indicated in my question?

A. Yes, sir.

Re-cross-Q. 143. On the girls' page it reads as follows: "Friday, 28; Monday, 31; Monday, 1; Wednesday, 2; Thursday, 3;" does it not, except that the second Monday seems to have been first written 3, and altered to 1; or else written 1, and altered to 3?

A. As the book states I leave it.

Re-cross-Q. 144. Does not the book state as indicated in my question?

A. Yes, sir.

Re-Cross-Q. 145. I notice that the name of Mr. William R. Gorgas frequently appears among the visitors. Did he have anything to do with the school officially?

A. No, sir; not during my time of teaching in the township.

Re-cross-Q. 146. Who have you talked with in the last year about any of your visits to Drawbaugh?

A. I have spoken with Mr. Cyrus Templin, of Shiremanstown, and others.

Re-cross-Q. 147. Please to name all the others.

A. I cannot.

Re-cross-Q. 148. Please to name some of the others.

A. Quite recently I have spoken to Mr. Jeremiah Fry, John Templin, and Mr. W. H. Zearing.

Re-cross-Q. 149. Who else, within the last year?

A. I do not remember of any particularly. It has been a general talk throughout Shiremanstown.

Re-cross-Q. 150. Do you mean by that that this suit and the witnesses Drawbaugh was going to have, and the dates they were expected to swear to, have been matters of general talk throughout Shiremanstown?

A. There was nothing spoken of in my hearing about any particular witness or witnesses, or dates. It was particularly about his inventions.

Re-cross-Q. 151. What about them?

[*Objected to by Mr. Hill, so far as it relates to any other invention than the talking-machine, as being hearsay, irrelevant and immaterial, and statements so made, in conversation with others, concerning this invention, are objected to as evidence of any fact so stated, on the ground that they are hearsay.*]

A. I cannot remember the conversation.

Re-cross-Q. 152. Where did any of those conversations take place?

A. What I heard were in the stores.

Re-cross-Q. 153. Did not those conversations turn on the dates when some of these people were going to swear they had seen his machines, or heard about them?

A. They may have, but not in my hearing.

Recess for dinner, until 2.30, P. M.

Monday afternoon, May 16, 1881.

Examination resumed, pursuant to adjournment.

Same counsel present.

Re-cross-Q. 154. Do you think you have told us everybody you remember to have talked with about Drawbaugh's inventions, during this last year?

A. I could not say that I have, or that I have not.

Re-cross-Q. 155. I wish you would mention any other names that you remember.

A. I do not think I can.

Re-cross-Q. 156. Is there any reason why your memory is better about the events of 1876 than the events of last year?

A. When I first saw it, it attracted my attention more than of the last few years.

Re-cross-Q. 157. It never has occurred to you, during the last few years, as extraordinary that anybody else should have got the credit of bringing out the telephone, has it?

A. I read of the Bell telephone.

Re-cross-Q. 158. When did you first read of the Bell telephone?

A. I cannot fix the date.

Re-cross-Q. 159. About how long ago?

A. It may have been three years ago or three and a half.

Re-cross-Q. 160. Did not you have any talk with Drawbaugh about the Bell telephone at any time?

A. Not directly.

Re-cross-Q. 161. What talk did you have with him indirectly about it?

A. Nothing more than when he took my affidavit as a witness in this case.

Re-cross-Q. 162. What was the talk then between you, or in his presence, about the Bell telephone?

A. It was bearing on this suit. The words I do not remember.

Re-cross-Q. 163. What was the substance of it?

A. He asked me if I had not been in his shop and saw the speaking-machine before I taught in the fall of 1878 and 1879.

Re-cross-Q. 164. I want to know what talk you had with him then about the Bell telephone, or the substance of it, or any part of it.

A. I cannot give it.

Re-cross-Q. 165. Why is it that you remember so well a talk which you had in 1876, and cannot remember a talk which you had a few months ago?

A. It was new at that time and attracted my attention, as I stated before.

Re-cross-Q. 166. When he showed you his telephone in 1879, are you very sure that nothing was said between you about the Bell telephone, or about having seen accounts of telephones in the newspapers?

A. It would be impossible for me to endeavor to relate our conversation since the spring of 1879.

Re-cross-Q. 167. Why?

A. We met very frequently.

Re-cross-Q. 168. I do not ask you to relate your conversation. I ask you whether you did not, some time in 1879, have some conversation with him about the Bell telephone, or about having seen accounts of telephones in the newspapers?

A. I do not recollect.

Re-cross-Q. 169. When you saw him in 1879, and he showed you his telephone, did either of you say anything about the visit which you say you made there with your pupils?

A. We did not, to the best of my recollection.

Re-cross-Q. 170. When did you, for the first time, hear that Drawbaugh claimed that he had invented the telephone before Bell did?

A. I don't know for certain. It was, to the best of my knowledge, some time last fall, but I did not hear him say it.

Re-cross-Q. 171. Who did you hear say it?

[*This question, with the preceding one and the preceding answer, objected to by Mr. Jacobs as irrelevant, immaterial, and hearsay.*]

A. It was general talk.

Re-cross-Q. 172. What was the nature of this talk?

[*Same objection.*]

A. I can scarcely say.

Re-cross Q. 173. Please give us your best recollection about it.

[*Same objection.*]

A. It was general gossip, as I before said, and I paid little attention to it.

Re-cross-Q. 174. I wish you would tell us the general drift of that gossip.

[*Same objection.*]

A. I cannot give you the drift of it.

Re-cross Q. 175. Where did you hear this gossip?

[*Same objection.*]

A. At the town in which I lived—Shiremanstown.

Re-cross-Q. 176. Where in the town?

[*Same objection.*]

A. At the stores.

R-cross-Q. 177. Please to name some of the persons you heard taking part in the general gossip.

[*Same objection.*]

A. It would be useless for me to attempt that, as I paid little attention to it.

Re-cross-Q. 178. I understand, from your one hundred and thirty-second answer, that the name of school-house No. 2 was definitely fixed as Cedar Hill school, by the superintendent. in the fall of 1877. Is that correct?

A. The difference of opinion was between the school-board, and by what I could understand, the superintendent. The superintendent claimed that Cedar Hill was the right name.

Re-cross-Q. 179. Do you mean that Cedar Hill was the recognized name for it, from and after the fall of 1877, and that was why you applied that name to it?

A. The superintendent claimed that Cedar Hill was the right name.

Re-cross-Q 180. Will you tell me, if you have any recollection at all on the subject, when it was that that school-house acquired the name of Cedar Hill school?

A. I think that was the right name always—Cedar Hill, or Gorgas.

Re-cross-Q. 181. It has always appeared that the teacher and the secretary called it Cedar Spring in 1876. Do you, or do you not, know when it began to go by any other name; and if so, when?

A. I was always under the impression that it was the Cedar Hill, or Gorgas, school-house.

Re-cross Q 182. But that impression of yours seems to have been contrary to the official designation given to it by the teacher who taught it and the secretary who had charge of it, was not it?

A. Yes, sir.

Re-cross-Q. 183. What was the name of the superintendent referred to in your one hundred and thirty-second answer?

HONE COMPANY,-1

A. D. E. Kast.

Re-cross-Q. 184. Will you explain to me why it is that all your reports for the first year after you went there, and until report dated November 18, 1879, call it the Cedar Run school? Please look at them and see if it is not so.

A. I cannot say why I did that.

Re-cross-Q. 185. Did you call it Cedar Run because you always believed its name was Cedar Hill, and because the superintendent, in the fall of 1877, officially decided that its name was Cedar Hill?

A. My general impression was that Cedar Hill, or Gorgas' school, was the right name. Why I wrote that I cannot say.

Re-cross-Q. 186. I notice that your report, which begins in the middle of October, 1879, is the first one that calls it Cedar Hill school. Don't you think that it was in that fall that the superintendent officially decided that its name was Cedar Hill?

A. The secretary, W. H. Zearing, required me to call it Cedar Hill school, as that was the right name. Prior to that, John C. Comfort was secretary, and said nothing about it.

Re-cross-Q. 187. And I suppose that, as you always understood that its right name was Cedar Hill, and knew that the superintendent had decided that that was its right name in 1877, you required a special order to make you call it by its right name; is that the case?

A. He told me to write it Cedar Hill.

[*The reports are as stated in the one hundred and eighty-fourth and one hnndred and eighty-fifth questions.*]

Re-re-direct by Mr. Jacobs:

Q. Q. Q. 188. Please state whether or not the schools in Lower Allen township are designated by number as well as by name.

A. They are.

Q. Q. Q. 189. What is the number of the school which was taught by Mr. Strong in January and February, 1876, and taught by you since the fall of 1878?

A. Number two.

[*At the request of respondents, the examiner certifies that upon its title-page the book produced by witness appears to be the book of reports for school No. 2, Lower Allen township, Cumberland county, and that all the monthly reports in said book appear to be for Lower Allen district, Cumberland county, school No. two.*]

Q. Q. Q. 190. Please state whether both of the school-houses referred to in your testimony are not located upon the banks of, or near to, the same small stream?

A. They are.

Q. Q. Q. 191. What is the name of that stream?

A. Cedar Run.

Q. Q. Q. 192. And has that fact been the cause of the confusion in the name of the two schools?

A. It may have. I can't say positively.

Q. Q. Q. 193. What is the number of the school-house in which you taught during the winter of 1875–'6?

A. It was then No. 4. It is now No. 3, as Shiremanstown has withdrawn, and forms a separate school-district.

Q. Q. Q. 194. How long did John F. Rupp continue in your school, after you made the visit to Drawbaugh's shop, in company with him and other pupils?

A. It may have been three weeks.

Q. Q. Q. 195. Did he continue in your school beyond that winter?

A. He did not.

Re-re-cross-examination by Mr. Storrow:

Re-re-cross-Q. 196. In going from Mechanicsburg to the Gorgas school-house, do you pass through Shiremanstown?

A. Yes, sir.

Re-re-cross-Q. 197. Does that road also pass by Eberly's Mills?

A. No, sir; in driving from Shiremanstown to the Gorgas school, you do not pass through Eberly's Mills.

Re-re-cross Q. 198. About how far beyond the school are Eberly's Mills?

A. About one fourth of a mile.

Examination taken, reduced to writing, and by the witness subscribed and affirmed to before me, this 16th day of May, 1881.
FRED. M. OTT,
Examiner.

D. A. HAMACHER.

JOHN F. RUPP, *being produced, affirmed, and examined, saith:*

Examined by Mr. Jacobs:

Q. 1. State your age, residence, and occupation.

A. Twenty-six years; residence, one mile south of Shiremanstown; occupation, florist.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him about ten years, or more, as near as I can tell.

Q. 3. You have heard the testimony of Mr. D. A. Hamacher, who has just left the witness-stand, with regard to a visit made to the shop of Daniel Drawbaugh, by him, in company with yourself and other pupils. Do you remember that visit, and if so, when, to the best of your recollection, was it made?

A. I do; it was made in the year 1876, during the early part of February.

Q. 4. How do you fix the date in the early part of February?

A. Because it was not long before I quit schooling.

Q. 5. When did you quit schooling?

A. In the year 1876.

Q. 6. What part of the year 1876?

A. Near, or about, the close of February.

Q. 7. How old were you at that time?

A. A few weeks over twenty-one years.

Q. 8. Did you ever attend a common school after the close of February, 1876?

A. No, sir.

Q. 9. Upon the occasion of that visit to Drawbaugh's shop, did you see any talking-machines there?

A. Yes, sir; I saw machines, which he told us were talking-machines.

Q. 10. Please look at instrument marked "A," and state whether you saw it there on that occasion?

A. I saw a machine similar to it, or this machine [taking up "A"].

Q. 11. Did he explain it to you, or in your presence?

A. I heard no particular explanation, more than it was worked by electricity. The conversation was altogether between Mr. Drawbaugh and Mr. Hamacher. I was not with them all the time.

Q. 12. You have said that he called it a talking-machine. Did he say how far he could talk with it?

A. He stated no particular distance, as to how far he could talk then, but he said that he could have it so perfected that he could speak to San Francisco.

Q. 13. Did you see, then and there, any other talking-machines besides instrument "A" ?

A. Yes, sir; he showed us this one ["F"].

Q. 14. Was it then in about the same condition that it is now ?

A. Its general appearance was about the same.

Q. 15. How long was the party in the shop ?

A. I cannot tell exactly, but about an hour and a half.

Q. 16. Did you look at other things there besides the talking machine ?

A. I did.

Q. 17. Did you see the talking-machine immediately after you went inro the shop, or after you had been looking at other things ?

A. No, sir; I saw several others before.

Q. 18. Did you see there an instrument for telegraphing, and, if so, did you see it before or after the talking-machine ?

A. Yes, sir; before.

Q. 19. What time in the day were you at the shop ?

A. I cannot fix the hour, but it was about the middle of the afternoon.

Q. 20. Where had you spent the former part of that day ?

A. At Mr. Strong's school.

Q. 21. How far from Eberly's Mills ?

A. About one fourth of a mile.

Q. 22. How much of that day had you spent at Mr. Strong's school ?

A. The greater part of the forenoon and about an hour and a half or less in the afternoon.

Q. 23. What was the occasion of your being absent from your own school and visiting another on that day ?

A. The school-board having new desks put in the school-room on that day, there was no school.

Q. 24. Do you mean at the school which you were attending and Mr. Hamacher teaching ?

A. Yes, sir.

Q. 25. Where was that ?

A. At the school that is best known as Frogtown school.

Q. 26. Was it also known as the Cedar Run school ?

A. Yes, sir.

Q. 27. Had you had any conversation with Mr. Hamacher about Drawbaugh's talking-machine before you made that visit in company with him and others to Drawbaugh's shop?

A. Yes, sir.

Q. 28. Then you knew of Drawbaugh's talking-machine before, did you?

A. I had heard of it.

Q. 29. Were you walking during that visit?

A. Yes, sir.

Q. 30. How far did you and the rest of the party have to walk in order to get home after leaving Drawbaugh's shop?

A. I walked about three miles, and some of the others the same distance. I believe we were the furthest, that walked—a couple of us.

Q. 31. How far was Cedar Run, or Frogtown, school-house from Drawbaugh's shop?

A. About two and a half miles, or a little farther.

Q. 32. Have you ever been to Drawbaugh's shop since that day?

A. I have not.

Cross-examined by Mr. Storrow:

Cross-Q. 33. Please state all the machines of Drawbaugh's manufacture or invention that you saw at his shop on that visit.

A. The electric clock, telegraph, fire-alarm, and the talking-machine.

Cross-Q. 34. Did not you see any others?

A. Not that I remember of.

Cross-Q. 35. What kind of a thing was the telegraph that you saw?

A. It was a dial with letters around the edge, having a hand or needle in the center.

Cross-Q. 36. Did you understand that Drawbaugh had invented that?

A. He did not say whether he did or not, but I thought he did invent it.

Cross-Q. 37. And did you think that he had invented the fire-alarm, too?

A. Yes, sir.

Cross-Q. 38. How many electric clocks did you see there?

A. I remember of seeing one.

Cross-Q. 39. Only one?

A. That is all.

Cross-Q. 40. What kind of business was being carried on in the shop—what things were being manufactured?

A. I cannot tell what the manufacture then was.

Cross-Q. 41. What manufacture was carried on at his shop at any other time?

A. Manufacture of faucets and pumps.

Cross-Q. 42. When was that?

A. I can't fix any date or year.

Cross-Q. 43. Who, besides Drawbaugh, carried on that faucet and pump business there?

A. It was carried on by the Drawbaugh Manufacturing Company.

Cross-Q. 44. When did you last see either of the instruments "F" or "A," before to-day?

A. On last Saturday,

Cross-Q 45. When last before that?

A. Some time during last winter.

Cross-Q. 46. Who showed them to you then, and where?

A. Mr. Drawbaugh, at my home.

Cross-Q. 47. Have you made an affidavit about these instruments?

A. Yes, sir.

Cross-Q. 48. Please state all that you heard Drawbaugh say about the talking-machine, on the occasion of your visit with Mr. Hamacher?

A. He said it was worked by electricity; would take the place of the telegraph, and that he could make it so that he could talk to San Francisco.

Cross-Q. 49. Have you ever had any other talk with him about his talking-machine, between that time and the time last winter?

A. No, sir; I did not see him often.

Cross-Q. 50. How far have you lived from his shop since the spring of 1876?

A. About three miles.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me this 16th day of May, 1881.
FRED. M. OTT,
Examiner.

JOHN F. RUPP.

Adjourned until May 17th, at 10 o'clock, A. M.

May 17, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Hill and Mr. Jacobs for respondents, and Mr. Storrow for complainants.

H. B. MUSSER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. My age is forty-one; residence, Camp Hill, Cumberland county; occupation, farmer.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penn'a; and, if so, how long have you known him?

A. I have known him about twenty years, since a short time after he made that patent stave-jointer.

Q. 3. Have you ever been at his shop at Eberly's Mills?

A. Yes, sir; I have.

Q. 4. State whether, during any visit to his shop, you ever saw any talking-machines there; and, if so, when you first saw them?

A. I saw them in 1874, on the twenty-seventh day of June.

Q. 5. How do you fix the date?

A. I had my reaper repaired there—fixed.

Q. 6. Did you make any entry in writing in a book, about the repair of the reaper at that time?

A. Yes, sir.

Q. 7. Have you the book here?

A. Yes, sir; I have the book here.

Q. 8. Please show the book to the examiner, and point out the entry, in order that he may copy it on the record.

A. This is the entry here.

[*The entry shown to the examiner is as follows:*

"27 *Moewing fix*, 60"

The examiner certifies that the above entry occurs on a page which is headed:

"*June*, 1874. *Cost on the farm*."]

Q. 9. State whether or not that book is the book which you kept entering up, day after day, your farm accounts, expenses, profits, &c.

A. Yes, it is.

Q. 10. Please look at the instruments now shown you marked "F" and "B," and state whether you ever saw them before to-day, and, if so, when and where you first saw them?

A. Yes, sir; I saw them in Drawbaugh's shop in 1874, the 27th day of June.

Q. 11. Did anybody talk through them at the time when you first saw them?

A. Yes, sir.

Q. 12. Who talked and who listened?

A. Mr. Drawbaugh talked and I listened.

Q. 13. Where was he when he was talking, and you, when you were listening?

A. He was in the north room and I was in the south, and there was an entry between those rooms that went into the machine-shop.

Q. 14. Were the two instruments connected in any way? If so, how?

A. They were connected with a wire.

Q. 15. Did you hear and understand what he said through the instrument?

A. Yes, sir.

Q. 16. Did you have any conversation at that time with Mr. Drawbaugh about the instrument?

A. Yes, sir.

Q. 17. Did he tell you how far he could talk through it? If so, what did he say?

[*Objected to as leading.*]

A. Yes; he told me he was going to make a machine to talk from Harrisburg to Philadelphia, and he said it would be a cheaper and quicker way than telegraphing. I could hardly believe my own conscience that he could do so.

Q. 18. Did he tell you what the principle of the machine was—whether it operated by electricity or not?

[*Objected to as leading.*]

A. Yes, sir; he told me it would go by electricity. He told me he wanted to make it quicker than telegraphing.

Q. 19. In that conversation, was anything said about electric conductors? If so, what?

[*Objected to as leading.*]

A. Yes, sir. He told me there was a high conductor and a low conductor, but I could not understand his low conductor or his high conductor,

HONE COMPANY,-1

and I do not understand it at the present day. He showed me there something that he had—low conductor and high conductor—and two things flattened together, using his hands, with the palms together, to show me, [thus,] and called it a low conductor, and the one raised a high conductor. I understood it in that way. He explained it in that way to me, but I could not understand it.

[*The witness in illustration, in the course of his answer, presses the palms of his hands together.*]

Q. 20. Did you ever see talking-machines at Mr. Drawbaugh's shop, after that visit? If so, when did you next see them?

A. Yes, sir; I saw them in 1876, in June.

Q. 21. How came you to be at his shop in June, 1876?

A. I took my reaper down there to get one of these patent spindles put on the pitman rod.

Q. 22. Have you an entry of that in your book also?

A. No, sir; at the time I paid—settled with it—I have. I settled with Captain Moore.

Q. 23. How long after you got that work done did you settle for it?

A. I settled on the 29th day of August, 1876.

Q. 24. Please hand your book to the examiner in order that he may copy it upon the record.

[*The entry shown is as follows:*

"29 *J. A. Moore, pd. fix mowing machine,* 19.25."

The heading of the page bears the dates "August" and "1876."]

Q. 25. Your book-entry showing the payment in 1876, how do you fix June as the time when you took the machine there to be fixed?

A. I wanted to get it fixed before I commenced making hay.

Q. 26. About what time does the hay-making season begin in your neighborhood?

A. From the 17th to the 22nd of June we generally commence; it depends a good deal upon how the weather is. Last year I was done making hay on the 21st of June.

Q. 27. At that visit, when you went to get your mowing-machine fixed, in June, 1876, did Mr. Drawbaugh show you the same instruments "B" and "F" that you had seen before?

A. No, sir.

Q. 28. Please look at the instrument "A" now shown you, and state whether you ever saw that before to-day, and if so, when and where you first saw it.

A. No; I never saw this.

Q. 29. Please look at the instruments "D" and "E," now shown you, and state whether you ever saw them, or either of them, before to-day; and if so, when and where you first saw them?

A. Yes, I saw this one [taking up "D."] I saw this one in 1876, in June, when I brought my reaper to the shop.

Q. 30. Did anybody talk through it at that time?

A. Yes, sir.

Q. 31. Who talked through it, and who listened?

A. Drawbaugh talked to me and I listened.

Q. 32. Did you hear and understand what he said through the instrument?

A. Yes, sir.

Q. 33. Did you talk any through the instrument?

A. No, sir; I did not.

Q. 34. Where were you and Mr. Drawbaugh when he was talking and you listening through that instrument?

A. I was in the same room as I was at first—when he first spoke to me. He was in the north room.

Q. 35. Were you quite well acquainted, or but little acquainted, with Mr. Drawbaugh when you first went there in 1874 to get your mowing-machine fixed?

A. I was very little acquainted with him. I knew him, and that was about all.

Q. 36. In either of those conversations, in 1874 or 1876, was anything said by him about patenting the invention? If so, what?

A. No, sir.

Q. 37. Was anything said about his financial means?

A. No, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 38. How long have you lived at Camp Hill?

A. I have lived there since 1852.

Cross-Q. 39. How far is your house from Drawbaugh's shop?

A. Two miles and a half.

Cross-Q. 40. Have you ever been at his shop since June, 1874, more than once?

HONE COMPANY,-1

A. Yes; I have been there several times before now.

Cross-Q. 41. What have you been there for, those several times?

A. I lost the spool off of one of those spindles. That caused me to go there so often.

Cross-Q. 42. Who did the repairs on your reaper, on the first visit you have mentioned?

A. Mr. Drawbaugh.

Cross-Q. 43. How long did it take him?

A. It did not take him long.

Cross-Q. 44. What else did you see at his shop besides his talking-machine on that occasion?

A. He had clocks there. He had a kind of a machine there,—he said he wanted to make a fire-alarm; and then he had a kind of a machine there he made to wrap wire, somehow; and then he was making a belt, he called it electric belt. That is all I recollect.

Cross-Q. 45. By wrapping wires, do you mean winding wires with thread like the green wound wires on "B?"

A. Yes, sir.

Cross-Q. 46. How many clocks did you see there in 1874?

A. There was three clocks there in 1874.

Cross-Q. 47. Describe them.

A. One was a clock that he had finished to go by electricity, extending the wires into the earth; and another that he had was not finished; another was an old eight-day clock that he had there.

Cross-Q. 48. What kind of a case did the finished clock have?

A. It was a longish one; pretty near all one glass in front. You could see all the works.

Cross-Q. 49. How tall was it?

A. I could not tell you how tall it was exactly; it was as tall as the ceiling was from the floor, pretty near.

Cross-Q. 50. Did he explain the clock to you, how it worked?

A. Yes, sir.

Cross-Q. 51. Did he explain to you how the other things worked, that you have mentioned?

A. No, sir.

Cross-Q. 52 What time of day was it when you were there?

A. I can't tell you that positively.

Cross-Q. 53. Forenoon or afternoon?

A. That is more than I can tell you; I can't recollect that.

Cross-Q. 54. What else had you been doing that day?

A. I could not recollect that either.

Cross-Q. 55. How long did it take you to carry your machine down to his shop and get it mended and go home again?

A. I do not know how long. If he could do it right away, it would take about a half a day, or a quarter.

Cross-Q. 56. Did he do it right away, or was he busy at something else, so that you were kept waiting?

A. That I do not know.

Cross-Q. 57. Who went there with you?

A. No one.

Cross-Q. 58. Who did you see there on this first visit?

A. No one but Mr. Drawbaugh.

Cross-Q. 59. Was any manufacturing business going on in the shop at that time?

A. I do not know exactly, but I most think they were working at the faucets.

Cross-Q. 60. Did not you see any men at work there, besides Drawbaugh?

A. No, sir; no one there but Drawbaugh and I.

Cross-Q. 61. Had you been to Harrisburg, to market, that same day, when you saw "B" and "F?"

A. No, sir.

Cross-Q. 62. Had you been to Harrisburg for any purpose that day?

A. No, sir; my wife had been to market. In hay-making and harvest my wife goes to market, still, with my father—in right busy times.

Cross-Q. 63. Was that a busy time?

A. Yes, sir.

Cross-Q. 64. I suppose you had plenty of leisure to stop and hear a man with whom you were little acquainted tell you about things you did not understand, and which you had no particular interest in; did not you?

A. I don't understand the question.

[*Question re-read.*]

A. Yes, I would.

Cross-Q. 65. Was Dr. Musser, of Mechanicsburg, a relation of yours?

A. Yes, sir.

Cross-Q. 66. What relation?

A. First cousin.

Cross-Q. 67. He was one of the company that made faucets at Drawbaugh's shop, was not he?

A. Yes, sir.

Cross-Q. 68. Have you ever had any conversations with Drawbaugh about his talking-machines, except on the two occasions referred to?

A. No, sir.

Cross-Q. 69. Never spoken with him at all on the subject, since 1876?

A. Not till last week, one day, they were there. That is the first ever I heard anything about it.

Cross-Q. 70. Where did you see him last week?

A. At my home.

Cross-Q. 71. When you got your reaper mended, in 1876, was Captain Moore's Kline axle company carrying on business at Drawbaugh's shop?

A. Yes, sir.

Cross-Q. 72. In what story of the mill were the rooms referred to in your thirteenth answer?

A. In the second story, counting the basement as one. There was still another story above the one I was in.

Cross-Q. 73. Did you see the clocks on the same story?

A. Yes, sir.

Cross-Q. 74. Please make a little drawing of how that story was partitioned off.

[*Witness makes one, which is marked* " *Musser's diagram.* "]

Cross-Q. 75. When you had the talk with instrument " D, " did you use " D, " or did he use it?

A. I used this.

Cross-Q. 76. What did he use?

A. I cannot tell you.

Cross-Q. 77. When you saw "B," was the electro-magnet on it the same that is on there now, or was it a bigger one?

A. To the best of my knowledge, there was something over this here [indicating the open end of the tube of " B " next to the electro-magnet.] The electro-magnet was the same as it is now, to the best of my recollection.

Re-direct by Mr. Hill:

Q. Q. 78. When you were in Mr. Drawbaugh's shop after 1876, what were you there for?

A. I lost one of the spools off of the patent spindle that I had.

Q. Q. 79. Did you lose that spool off more than once?

A. Yes, sir.

Q. Q. 80. Were all your visits there after 1876 for the purpose of getting that spool repaired or put on again?

A. Yes, sir.

Q. Q. 81. Would you get it repaired and go right away again or would you remain after the work was done?

A. No, sir; I did not remain after the work was done. I hurried away.

Q. Q. 82. Was that spool on your mowing-machine?

A. It was on the pitman rod that drives the knife.

Q. Q. 83. Could you use the machine with the spool off, or with that thing off, whatever it was, that you went there to get put on?

A. Not very satisfactorily; you could not. We have shifted, by wrapping wire around to keep it to its place.

Q. Q. 84. Would that spool come off while mowing?

A. Yes, sir.

Q. Q. 85. Was it, or was it not, during your busiest season on the farm that that accident was liable to happen?

A. Yes, sir; it was.

Q. Q. 86. When you went to the shop in June, 1874, and saw the two machines "B" and "F," do you remember which one Mr. Drawbaugh had in the room where he was talking, and which one you had in the room in which you were listening?

A. To my best knowledge, this machine "B" is the one I had.

Q. Q. 87. When you went to the shop in June, 1876, to get the spindle put on your harvester, who put it on?

A. Drawbaugh.

Q. Q. 88. Did anybody help him?

A. Not as I know of.

Q. Q. 89. Was there any one at work in the shop at that time besides Drawbaugh? If so, who?

A. Yes, sir; George Drawbaugh.

Q. Q. 90. Were Daniel Drawbaugh and George Drawbaugh the only men at work in the shop at that time?

A. As far as I know, that is all that I saw in the shop at that time when I was there. That is all that I saw working there.

Q. Q. 91. In cross-answer seventy-seven, you say "there was something over this here," [indicating the open end of the tube "B"] next to the electro-magnet. Do you remember the appearance of that "something" which was over the end?

A. It looked a good bit like this here tissue paper or a hog bladder; something that color. It was very thin.

Re-cross by Mr. Storrow:

Re-cross-Q. 92. What was it you heard through these instruments—what words, if any?

A. I could not recollect.

Re-cross-Q 93. When you got the spindle put on to your harvester, was Dan Drawbaugh working on his own account, or was he in the employ of the spindle company?

A. He was employed in the spindle company, for he told me to pay Captain Moore. I had asked him what the bill was.

Re-re-direct examination by Mr. Hill:

Q. Q. Q. 94. Is that all you know about his being employed by the spindle company?

A. As far as I know.

Q. Q. Q. 95. In re-cross-answer ninety-two, you say you could not recollect what it was you heard through the instrument—what words. Do you recollect that you heard words through it?

A. Yes, sir.

Q. Q. Q. 96. Did you hear any whispering, singing, or other sounds through it?

A. No, sir.

Q. Q. Q. 97. Did Drawbaugh tell you something through it, or ask you a question? Do you remember about that?

A. No, sir; I don't know what he asked me.

Q. Q. Q. 98. Then all you remember is that he talked through the machine to you, and that you heard and understood him. Is that so?

[*Objected to as leading and assuming.*]

A. That is all I remember.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 17th day of May, 1881.

FRED. M. OTT,
Examiner.

HENRY B. MUSSER.

[*Mr. Abraham came in during the examination.*]

Adjourned for dinner until 2.30, P. M.

May 17, *afternoon session.*

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

ISAAC B. MILLARD, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am thirty six years old; residence, Newberry township, York county; I am a farmer.

Q. 2. Have you ever had any mechanical trade or occupation besides farming? If so, what?

A. I worked at house carpentering and as a mill-wright here in Harrisburg about eight years, and, altogether, about fourteen years.

Q. 3. Have you been a member of the school-board in your township, and president of it?

A. Yes, sir.

Q. 4. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him, I guess, nearly ever since I was quite a small boy—nearly since I knew anybody.

Q. 5. What was the date of your marriage?

A. November 11. 1869.

Q. 6. Prior to the time of your marriage, where did you live?

A. I had my home with my father, at Camp Hill, over here; but I lived a while, shortly before I was married, at Ezra Gilbert's, at Eberly's Mills.

Q. 7. About the time of your marriage, did you go anywhere else to reside? If so, where?

A. I had been working here in Harrisburg, from the latter part of July until the next summer before I was married; then I went to Ohio, and came back about the beginning of November, to Camp Hill, where my mother lived, and I was married. I considered Camp Hill as my residence, and voted there. My father died in the fall of 1868, while I was working in Harrisburg, before I went to Ohio.

Q. 8. Where were you married?

A. In Harrisburg.

Q. 9. After your marriage, where did you reside, and how long?

A. I resided in Harrisburg from about the beginning of December, 1869, when I went to housekeeping here, until August 20th, 1874.

Q. 10. Where did you go to reside on August 20th, 1874?

A. I moved to where I now live and have lived there ever since.

Q. 11. Did you purchase a farm about that time when you went to reside there?

A. No, sir; my father-in-law bought the farm and I moved on it to farm it.

Q. 12. Can you state when you or your father-in-law got the deed for that farm?

A. The farm was bought on the 15th of August, 1874, five days before I moved there, and he was to have a deed on the first of April, 1875, clear of all incumbrances; but during this time it became evident that the estate of Michael Strominger, deceased, from whose executor it had been bought, was insolvent, and the farm was sold a second time, by order of court, April 26, 1875—if my memory serves me—when my father-in-law again bought it and got the deed a few days afterwards

Q. 13. Were you ever in Mr. Drawbaugh's shop, at Eberly's Mills, prior to your marriage?

A. Yes, sir.

Q. 14. Please look at the machine "B," now shown you, and state whether you ever saw it before to-day, and if so, when and where you first saw it.

A. Yes, sir; I have seen it before, or something similar. I seen it in Drawbaugh's shop. It was somewhere between the time I lived at Mr. Gilbert's—between 1867 and 1869, when I first saw it.

Q. 15. Then it was prior to your marriage, was it?

A. Yes, sir.

Q. 16. How came you to see it then?

A. I hardly know how to word that answer. I was very frequently back and forwards at the shop while I lived at Gilbert's, and frequently I was there afterwards. I don't know exactly how often up to the time I was married.

Q. 17. During that time, up to the time you were married, did you see it more than once? If so, how frequently?

A. I seen it several times, but how often I would not be able to say.

Q. 18. Did you see it used before you were married?

A. Yes, sir.

Q. 19. Where, and how?

A. They had "B" in the shop, and the attachment they had to the wire or string—I don't remember whether it was a wire or string. We listened to this here [indicating the end of the box "B" farthest from the electro magnet].

Q. 20. Do you mean that they had something connected with the box "B" by a wire or string?

A. Yes, sir.

Q. 21. Where was the person who was talking to the machine while you were listening?

A. Some distance away, at the other end, with some kind of an instrument. I don't remember what kind of an instrument he spoke in. I don't remember whether I went to see it.

Q. 22. Did you hear and understand what was said through the machine?

A. Yes, sir.

Q. 23. Do you remember on what floor of the shop the instrument "B" was, when you listened at it?

A. The second floor.

Q. 24. Was the other man who talked into the machine on the same floor, or on another floor?

A. He was out on the bank.

Q. 25. About how far from the shop was he, to the best of your recollection?

A. It has been so long since I have been there—I would presume it is about fifty yards.

Q. 26. Did the wire or string run out of the shop on to the bank or hill where he was?

A. Yes, sir.

Q. 27. Who was out there on the bank talking into the instrument?

A. That I don't remember, whether it was Mr. Drawbaugh or some one of the young men who were with us. There might have been a couple of them.

Q. 28. While you were living in Harrisburg, before you moved on to the farm, were you in Mr. Drawbaugh's shop frequently or not?

A. No, sir.

Q. 29. About the time you moved on to the farm, were you there more frequently?

A. Yes, sir.

PHONE COMPANY,-1

Q. 30. Did you see any talking-machines there about that time?

A. Yes, sir.

Q. 31. Please look at these machines, some dozen or more, now shown you, and see if you find any of the machines that you saw about that time.

[*Witness picks out of the basket machines "A," "D," "E."*]

A. This one here, marked "A," had two wires attached to these here posts, and you listened at this hole, [indicating mouth-piece.] I recognize this one ["K"] as one that I have seen, and I have seen this one ["M."] I have seen these two, ["D" and "E,"] or something similar.

Q. 32. You say that the instrument "A" had two wires attached to the screw posts, and that you listened at the funnel or ear-hole. Who was talking into the machine when you listened at that instrument "A?"

A. Mr. Drawbaugh.

Q. 33. Where was he, and where were you at that time, when he was talking and you listening?

A. He was below in the shop, in the lower part. I was above in the upper story, or second story above the basement.

Q. 34. Did you hear and understand what he said?

A. Yes, sir.

Q. 35. You say you saw these two instruments "D" and "E," or something like them. Was any conversation carried on through those two instruments "D" and "E?"

A. Yes, sir.

Q. 36. Who carried it on?

A. Mr. Drawbaugh and I.

Q. 37. While the conversation was going on, where was Mr. Drawbaugh and where were you?

A. There was one instrument at one end of the shop and the other across the furthest end of the building; I don't know which instrument was at each place. These are the machines ["D" and "E,"] or something similar. He had them attached by means of a wire across the building.

Q. 38. Do you remember whether they were in the same room or different rooms?

A. No, sir; I don't.

Q. 39. Did you listen at one of the instruments, or talk into it, or both listen and talk?

A. Both listened and talked.

Q. 40. When you talked, was it into the same instrument at which you had just listened?

A. Yes, sir.

Q. 41. Did you find that you could carry on a conversation with Mr. Drawbaugh so as to be understood by him and to understand him when he spoke to you through the instruments?

A. Yes, sir.

Q. 42. Now, when these instruments, "A," "D," and "E," were thus used by you and Mr. Drawbaugh, as you have testified, about how long was it after you had moved on to the farm, to the best of your recollection?

A. This one ["A"] I saw first. Now, the time that I was in the shop, I was going from Harrisburg, here, back and forth to Lewisberry, during the spring and summer of 1874, and after I moved on the farm—in 1875—I was going back and forth to Mechanicsburg. It was during some of those visits that I made that I saw these three instruments, "A," "D," and "E."

Q. 43. How came you to be going back and forth between the farm and Mechanicsburg in 1875?

A. I was going to visit my sister.

Q. 44. Were you in the shop quite a number of times in 1874 and 1875?

A. I suppose something like three or four times. I remember of stopping there once to see him when he was not at home.

Q. 45. Do you remember when the Centennial Exhibition opened at Philadelphia?

A. Sometime in May, 1876, I think.

Q. 46. Do you remember your last visit to Mr. Drawbaugh's shop before the opening of the Centennial?

A. It was sometime before that.

Q. 47. Do you mean that your last visit to the shop, before the Centennial, was sometime before the opening of the Centennial?

A. Yes, sir; sometime before the opening of it.

Q. 48. Was it warm or cold weather, at the time of that last visit before the Centennial?

A. It was cold weather.

Q. 49. Did you see those instruments, "A," "D," and "E," at the time of that last visit, before the Centennial, or at an earlier time than that?

A. It was not later than that that I saw these two, "D" and "E," first. I saw "A" before that.

Q. 50. At the time or times before the Centennial, when you saw "A," and "D," and "E," did you see the old instrument that you had seen in 1869?

A. Not that I recollect of.

Q. 51. Please state again the time when you moved on to the farm.

A. August 20, 1874.

Q. 52. Then, in your 42d answer, you meant that in 1875 you were going back and forth to Mechanicsburg?

A. Yes, sir.

Q. 53. Now, after that last visit to the shop, in cold weather, before the Centennial, when were you next at Mr. Drawbaugh's shop?

A. I don't remember of being there till somewheres in February or the beginning of March, 1880

Q. 54. How came you to go there then?

A. I took my uncle, William Walter, up to see Mr. Drawbaugh.

Q. 55. Did you see Mr. Drawbaugh?

A. Yes, sir.

Q. 56. Did you see any more talking-machines at that time?

A. Yes, sir.

Q. 57. Please look at the fifteen or more talking-machines in the baskets now before you and on the table, and see if you see any of the instruments that you saw there during that visit to Mr. Drawbaugh's shop, in the winter or early spring of 1880, and, if so, point them out to the examiner.

A. I saw these two, "K" and "M," at that time, but he did not use them more than he was taking them apart, and was explaining the principle that they worked on; and I also seen one of these up against the wall. It was the one with the bell on—this one, [indicating "H."] I think I saw "J," but am not positive. He showed me several instruments, the inside of one of which resembles the inside of "J." I designate the other one ["H"] by the bell; that I know I saw.

Q. 58. Did you, at that time, hear any one talk through any of the talking-machines?

A. No, sir.

Q. 59. When Mr. Drawbaugh showed you his talking-machines, at various times from 1868 or 1869 down to 1880, as you have testified, did he, at such different times, explain them, or try to explain them, to you?

A. He told me several times what principle they worked upon.

Q. 60. What did he tell you about it?

A. He told me that it was done by means of electricity.

Q. 61. Did he tell you how the sound was conducted by electricity, or try to explain it to you?

A. Yes, sir.

Q. 62. State what you remember of the words that he used in making these explanations.

A. I can't just give exactly the language that he used, more than part that I remember; that by means of certain conductors, I understood him, would form a battery. We were at that time speaking of conveying sound through water by a wire. He had that instrument "H" up against the wall, and a wire running down into the water. He had been experimenting; but the wires were torn down and the instruments were not in operation when my uncle and I called there.

Q. 63. What water was it?

A. The Yellow Breeches creek.

Q. 64. Did he say what kind of conductors?

A. He was speaking of a high conductor and a low conductor that would perform certain parts of the work, or have certain effects, I don't just remember which. He was getting a little deeper into philosophy than what I can comprehend.

Q. 65. What was the first time when you ever heard him speak of high conductors and low conductors, in connection with talking-machines?

A. I don't distinctly recollect of him speaking of high and low conductors more than the last visit, when my uncle and I were there.

Q. 66. Have you any impression on your memory as to his speaking of them before that time?

[*Objected to.*]

A. No, sir.

Q. 67. Do you recollect the circumstance, that during one of your visits to Mr. Drawbaugh's shop, a portion of an instrument dropped out and fell on the floor?

A. Yes, sir.

Q. 68. When was that, and what instrument was it, to the best of your recollection?

A. It was a machine of something of this description, [holding up "O" and "G"]. It was a diaphragm; he spoke of it. It was dark, and did not look like brass, such as these. It might have been corroded. I would not say what kind of metal it was.

[*The witness, after taking off the covers and taking out the diaphragms of several instruments, after giving his above answer, finally comes to instrument "L," and, taking out the diaphragm and holding it bottom up, says: "Here it is."*]

I recognize the peculiar-shaped irons inside. As near as I can recollect, it was in 1880, the last visit that I made. He was explaining the way the sound would vibrate in here. He had opened several instruments that he had experimented with. He was explaining to my uncle. There was none of them, at that time, in operation. The wires were all down, pretty much.

Q. 69. In your conversations with Mr. Drawbaugh about the talking-machine, prior to your marriage, was anything said about the distance to which he could talk through it?

A. Not that I remember of.

Q. 70. Was anything said about that during your visits to the shop in 1874 and 1875?

A. Yes, sir.

Q. 71. What was it?

A. By his conversation, I was under the impression that he meant a machine to take the place of the telegraph.

Q. 72. Was anything said by Mr. Drawbaugh, during your several visits to the shop, with respect to patenting the invention? If so, what was said, and when?

A. He always left me under the impression that he wanted to have it patented as soon as he could secure the means; that he was not able to carry the thing through.

Q. 73. What was your information about his financial condition from 1869 down to 1880?

A. As far as I knew, it was about all he could do to make a living, with his experimenting that he was doing, and scarcely could do that.

Q. 74. I understood you, that at one time you saw the interior of the instrument "K"; am I correct?

A. This looks very much like a machine I saw. It had a pulley inside like this, and had two wires attached here to the two small posts. This I seen the time my uncle amd I was there. He was explaining whether one would have the better effect by having the curved magnet placed at the side, like the one in "K," or when placed in the bottom, as in "L." I was under the impression that there was a small knob on this long wire on "K," to turn the pulley inside.

Cross-examined by Mr. Storrow:

Cross-Q. 75. Please state all that Drawbaugh said to you and your uncle on the occasion of the visit of you and your uncle to Drawbaugh's shop, in addition to what you have already stated, in regard to talking-machines.

A. In regard to talking-machines, when we first got there he was showing us that large machine, "H." It was up, and he got to telling us that he was trying to get up a machine that he could talk across the Atlantic ocean. He was explaining it, and my uncle put the question to him whether sound would not lose every certain distance. Then he got to explaining to him how that this could be avoided, and got to speaking of his high and low conductors, and different materials that would form a battery, and then he got deeper into philosophy than I could comprehend. I did not pay much more attention to it, but thought they might go ahead.

Cross-Q. 76. Was there anything more said about talking-machines that you did comprehend, in addition to what you have already testified?

A. No, sir; just what I said before.

Cross-Q. 77. Where does your uncle live, and what is his business?

A. In Washington Territory. I don't know whether he follows any particular business. He owns a large tract of timber land, and raises a great deal of fruit, and ships it to Olympia.

Cross-Q. 78. Where was he living at the time of that visit to Drawbaugh's shop?

A. He had his home in Washington Territory. He was in here on a visit, and stayed about six months, I suppose.

Cross-Q. 79. Who did he stay with?

A. He was visiting the whole of his relatives. He did not have any particular place to stay.

Cross-Q. 80. What did you and he go to Drawbaugh's for on that occasion?

A. He was inventing a machine that some of the parts were not altogether clearly plain to him, and he went up there for advice.

Cross-Q. 81. When you listened at instrument "A," what instrument was the other person talking into?

A. I don't know exactly whether it was one of these other instruments or not [picking up "O" from among the others]. This ["A"] was the one I listened to. I recognize it by this hole at the side.

Cross-Q. 82. Did you see the one that the other person talked into?

A. I saw it, but I don't remember that of examining it close, more than they told me I should listen there [pointing to "A"] and they would speak into the other.

Cross-Q. 83. Was it a wooden instrument, something similar to these before you?

A. I took it to be a wooden instrument, something similar to that [picking up "O"].

Cross-Q. 84. When did you last see any of these instruments before this week?

A. Mr. Drawbaugh came down through our neighborhood last winter some time, and he had a few of them along, and asked me if I recognized any of them.

Cross-Q. 85. Did you make an affidavit then for him?

A. No, sir.

Cross-Q. 86. Were not you at any time asked to make any affidavit for him?

A. He or Mr. Jacobs asked me whether I would have any objections to making an affidavit, and I told him that I would not have any objections.

Cross-Q. 87. What other inventions, besides the speaking machine, has Drawbaugh experimented on since you first knew him?

A. That is a pretty hard question to answer.

Cross-Q. 88. Hard because there are so many, or because there are so few?

A. There have been a good many of them—so many that I can't recollect them all. I can mention some, but I am satisfied that I can't mention all the machines.

Cross-Q. 89. Please mention all that you do recollect.

A. The stave-jointer, stave-cutter, nail-feeder, tack-machine, faucets, and, whatever they call it, spindle-bush. He was figuring on a swing on an engine (the time the Government offered that reward for

AMERICAN BELL TELEPHON

the smallest steam-engine) and a pump; and he was experimenting with the same thing to make a fire-engine; his clock, electric clock, and his telephone.

Re-direct by Mr. Hill:

Q. Q. 90. Were the most of those things prior to 1869?

A. All but the clock and telephone. Those are all that I have seen, I believe, since that.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 17th day of May, 1881.
FRED. M. OTT,
Examiner.

ISAAC B. MILLARD.

Adjourned until May 18th, at 10 o'clock, A. M.

Wednesday, May 18, 1881, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

JOHN C. SMITH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, twenty-nine; residence, Steelton, Dauphin county, Pa.; occupation, machinist.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. Yes, sir; I could not exactly tell. Ever since I was a child.

Q. 3. Where and how were you employed from April 1, 1872, to April 1, 1873?

A. I was employed by the Pennsylvania Railroad Company, as fireman on a locomotive, on a schedule called "Tyrone Coal," between Harrisburg and Tyrone.

Q. 4. How do you fix the time of such employment?

A. By my time-book.

Q. 5. Have you your time-books here, and have you referred to them for the purpose of fixing the time?

A. Yes, sir.

Q. 6. What engine were you firing during that year?

A. Engine No. 502.

Q. 7. While you were firing that engine, No. 502, on what days of the week were you at work and on what days idle?

A. I was at work on the six regular working days of the week, and idle on Sunday.

Q. 8. Where and how did you generally spend your Sundays during the year that you were firing that locomotive?

A. Generally at home with my parents, and with Daniel Drawbaugh in his shop.

Q. 9. Were you in Drawbaugh's shop most every Sunday during that year, or not?

A. Nearly every Sunday.

Q. 10. Was his shop open on Sunday, or locked?

A. Generally locked.

Q. 11. How did you get in when it was locked?

A. I would rap, or call, or sometimes climb in the window.

Q. 12. How long were you in the habit of staying in the shop with Drawbaugh, on Sundays, when you would go there?

A. Sometimes an hour, and sometimes longer.

Q. 13. Did you see any talking-machines in the shop while you were there on those Sundays?

A. Yes, sir.

Q. 14. What was generally going on in the shop on Sundays, when you were there?

A. Talking and experimenting.

Q. 15. Experimenting with what?

A. Sometimes talking-machines, and sometimes he had other experiments.

Q. 16. What were the greater part of his experiments upon?

A. Talking-machines.

Q. 17. What were those experiments? Explain how they were carried on.

A. An old glass tumbler with a cover over it, and a tin box with a magnet attached to it.

Q. 18. Please look at the instruments "B" and "F," now shown you, and state whether you ever saw them before to-day; and, if so, when and where you first saw them, or either of them.

A. I have. I saw them during the year I was firing coal train. In Daniel Drawbaugh's shop.

Q. 19. Are they the instruments with which the experiments were carried on that you referred to?

A. They look like them.

Q. 20. Did you hear any talking carried on through those instruments during that year?

A. To the best of my knowledge, I did.

Q. 21. Who talked, and who listened, when you heard the talking through them?

A. Daniel Drawbaugh talked, and I listened.

Q. 22. In what part of the shop was he, when so talking, and in what part of the shop were you, when so listening?

A. He was in the south-eastern, and I was in the north-western part of the shop, down stairs.

Q. 23. Were you both on the same floor, or on different floors?

A. On different floors.

Q. 24. What floors were you and he on, when talking through the instruments?

A. He was on the third, and I on the second; that is, counting the basement as the first floor.

Q. 25. Which one of the two instruments did you listen at, and which one did he talk into?

A. I listened at the tin box with the magnet attached to it. I suppose he talked into the tumbler.

Q. 26. Were the two instruments connected? If so, how?

A. Yes, sir; with two copper wires.

Q. 27. Explain how the wires extended from one point to another, and how they were supported.

A. They were run up to the ceiling, or beams, that ran across: and they then ran across, on those timbers, to the north-west corner of the shop, and then down through the floor to the room where I was.

Q. 28. How many times, during the year that you were firing the locomotive on the coal train, did Mr. Drawbaugh talk through the machines to you, as you have testified?

A. I could not state—frequently.

Q. 29. Do you know why he talked frequently through the machines to you?

A. I suppose to experiment,—to make it better.

Q. 30. Was that your understanding, at the time?

A. That was my understanding—experimenting to make it better.

Q. 31. When he would talk to you through the machines, how would he know that you heard what he said?

A. He would holler down and ask me, and I would go to the stairs and holler up what he said.

Q. 32. Do you recollect what kind of mouth-piece or mouth-pieces this tumbler "F" had on it at that time?

A. I can't recollect right; I think it had a flat cover on.

Q. 33. Do you mean a flat cover on the mouth of the tumbler under the mouth-piece?

A. It had a flat cover on somewhere; I can't recollect right.

Q. 34. Do you recollect anything about his having different mouth-pieces or making changes in the mouth-pieces?

A. Yes, sir.

Q. 35. Did he say why he was making those changes or trying those different mouth-pieces?

A. I can't remember.

Q. 36. When you would go to the stairway and tell him what you had heard through the instruments, do you remember what he would say from time to time?

A. "That's right," or "that's it," or "that's what I said."

Q. 37. Do you recollect whether or not, on any of those Sundays, he would make any changes in the machine and then ask you to listen in order to see how they operated as thus changed?

A. Sometimes.

Q. 38. Did he try to explain the instruments to you during that year and to explain how they operated?

A. Yes, sir.

Q. 39. Do you remember what his explanation was?

A. No, sir.

Q. 40. Did you, during that year, hear him say anything about electric conductors? If so what?

A. I remember of him having a needle suspended by a string, and explaining about the different electric conductors.

Q. 41. What kind of conductors did he speak of?

A. High conductors and low conductors and non-conductors.

Q. 42. Did he say anything, during that year, about how far he could talk through those instruments? If so, what?

A. Said he believed they could talk for a hundred miles.

Q. 43. Have you been in his shop since that year? If so about how often, to the best of your recollection?

A. I have, but I could hardly tell how often.

Q. 44. Have you been there every year since, down to 1880?

A. Yes, sir.

Q. 45. In the time from April, 1873, to the beginning of 1880, take the year that you were there the least number of times, and state how many times you would feel safe in saying that you were there that year.

A. About a half dozen times.

Q. 46. Is your father still living there, at or near Eberly's Mills?

A. No, sir.

Q. 47. When did he move away from there?

A. I think in the fall of 1878.

Q. 48. As you would be there in Mr. Drawbaugh's shop, from time to time, from April, 1873, till your father moved away, did you, from time to time, or did you not, see other talking-machines there?

A. Yes, sir; I did.

Q. 49. Please look at these machines, now shown you, marked "A," "D," "E," "G," "I," "K," "L," "M," and "O," and state whether you recognize any of them as having been seen at Drawbaugh's shop before your father moved away; and if so, point out to the examiner the particular instruments which you remember.

A. I remember this one [taking up "A"] as a particular one, and this here one ["D"]. I remember talking through "A" and "D," or some that looked like them. I saw other instruments resembling all those, [referring to the others named in the question,] after 1873.

Q. 50. When the talking was going on through instrument "A," who used it, and how?

A. We both used it, but not at one time, for listening. One would talk while the other would listen. We would change about. Daniel Drawbaugh and myself, I mean.

Q. 51. How near can you fix the time when you used the instruments "A" and "D?"

A. I can't fix the time for using them.

Q. 52. I understand you that it was before your father moved away. Is that right?

A. Yes, sir.

Q. 53. Have you any recollection as to whether it was a long time before your father moved away or not.

A. I have not.

Q. 54. Please look at these two instruments, "H" and "J," now shown you, and state whether you ever saw either of them at Mr Drawbaugh's shop before your father moved away?

A. I don't remember whether I did. I saw them after they moved away.

Q. 55. Where was the instrument "H" at the time when you recollect of seeing it first?

A. Fastened up against the wall.

Q. 56. Did you talk, or hear anybody talk, through either of the instruments "H" or "J?"

A. Yes, sir.

Q. 57. Both, or one; and, if only one, which one?

A. This one, "H."

Q. 58. Which of those two instruments did you see first?

A. "H."

Q. 59. What is your recollection as to how long it was after your father moved away before you saw instrument "H?"

A. I can't recollect how long it was after.

Q. 60. How long have you lived at Steelton?

A. I moved there September 9th, 1880.

Q. 61. Where did you live last before you moved to Steelton?

A. At 1222 Wallace street, Harrisburg.

Q. 62. How long did you live in Harrisburg before you moved to Steelton?

A. About nine years—boarding, keeping house, and all.

Q. 63. How long did you keep house here in Harrrisburg before you moved to Steelton?

A. About five years.

Q. 64. When were you married?

A. The 24th of January, 1875.

Q. 65. How have you been employed at Steelton since you have resided there?

A. Running lathes and a shaping-machine in the machine-shop of the steel-works.

Q. 66. How were you employed during the time when you kept house here in Harrisburg?

A. Firing and running a locomotive.

Q. 67. How were you employed between April, 1873, and the time when you went to keeping house?

A. Firing a locomotive.

Q. 68. The same locomotive that you were employed on from April, 1872, to April, 1873, or another?

A. Another.

Q. 69. After April, 1873, were you at leisure on Sundays while you were firing a locomotive, or did your schedule require you to work on Sundays?

A. The schedule required me to work 'till nine or ten o'clock on Sunday morning.

Q. 70. What was the route of your locomotive after April, 1873?

A. The same, only some thirteen or fourteen miles farther. I ran on Union Line freight, and we went on to Altoona instead of Tyrone, as before. We hauled special freight.

Q. 71. Were you at Drawbaugh's shop much on Sundays after you went on the special freight train?

A. Not much on Sunday.

Q. 72. Do you know what Mr. Drawbaugh's financial condition was between April, 1872, and the time when your father moved away?

A. I know he hardly ever had any money. He owned a property in Mechanicsburg, but besides that, he did not have any money. He partly owned the property in Mechanicsburg. He did not have it all paid for.

Q. 73. Do you recollect of his applying to you for a small loan of money? If so, state the circumstance.

A. One time I was over there and a man came there to collect a bill of two dollars, I think. He told the man he did not have a cent, and asked me whether I would not lend him two dollars.

Q. 74. Did you lend him the two dollars; and if not, why not?

A. No, sir; because I just did not have it, and because I thought, if I gave it to him, I would never get it back again.

Q. 75. Do you mean that you did not have two dollars in your pocket at the time, or that you did not have two dollars to spare and not get it back?

A. I just did not have it in my pocket.

Q. 76–77. And what made you think that if you lent him two dollars, you would never get it back again. Was it because he was not honest, or because he was always so hard up?

[*Objected to as leading.*]

A. He was honest enough, but he was always hard up.

Recess for dinner, until 2 o'clock, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Q. 78. Have you any record of the time that you were running on the locomotive 502?

A. Yes, sir.

Q. 79. If you have it with you, please produce it.

[*Witness produces a small pass-book.*]

Q. 80. I notice that there are twenty-one pages written on, prior to the page upon which you say is the first record of your time on engine 502. To what do these pages refer?

A. They refer to my working elsewhere.

Q. 81. Commencing at what date and ending when?

[*Question objected to because the entries in the book should speak for themselves, if the book is relied on for any purpose.*]

A. Commencing March 20, 1871, and ending March 31, 1872.

Q. 82. Now, from April 1, 1872, in whose handwriting are the entries?

A. My own.

Q. 83. When was that book purchased, and by whom?

A. As near as I can tell, it was purchased March 21, 1871, by myself.

[*The time-book referred to is offered for inspection of counsel on both sides.*]

Q. 84. Does that book contain a memorandum of every day you worked on engine 502?

A. It does; for eleven months, up to the first of March, 1873. After that, the account was kept in another book, which I also produce for inspection.

Q. 85. Does that second book contain a memorandum of all the time you worked on engine 502 not included in the first book submitted?

A. Yes, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 86. What other inventions, besides the talking-machine, has Drawbaugh experimented on since 1878?

A. I don't know.

Cross-Q. 87. Do you know that he has ever experimented on any invention except that?

A. Yes, sir.

Cross-Q. 88. What ones? State such of them as you can recollect.

A. Nail-feeding machine, self-feeders, rotary pumps, molasses faucets, hydraulic rams. That is all I can just think of.

Cross-Q. 89. Do you consider him much of an inventor?

A. I do.

Cross-Q. 90. I wish you would think of the names of some of the other things that he has invented.

A. Stave-cutters, stave jointers, and a carpet-tack machine, and a gas governor.

Cross-Q. 91. Did he ever make any inventions relating to the business you used to be engaged in—locomotives or steam-engines?

A. Not that I know of.

Cross-Q. 92. What work was being carried on at his shop when you first saw "B" and "F?"

A. I don't remember.

Cross-Q. 93. What other things of his did you see at the shop at that time?

A. I don't recollect. I don't think there was any other going on just at the time.

Cross-Q. 94. Why was Dan always hard up? Did he drink, or was he lazy, or what was the matter?

A. He spent the most of his time experimenting; that is the reason why, I thought, he was hard up. He was always sober and industrious.

Cross-Q. 95. Is he a good workman?

A. First-class.

Cross-Q. 96. Was he a man who could have got good employment and good pay around here if he had a mind to?

A. He told me they sent for him to come to Philadelphia different times; that they would give him five dollars a day.

Cross-Q. 97. When was it that he asked you to lend him two dollars and you did not?

A. I can't tell exactly.

Cross-Q. 98. Please tell as near as you can.

A. It was while I was railroading; that is about as near as I can get at it.

Cross-Q. 99. Was it before you were married, or after?

A. I could not say.

Cross-Q. 100. If I understand your testimony, you have kept house and boarded in Harrisburg and Steelton from the early part of 1872 to the present time. If not, where have you boarded during that time?

A. That is all right.

Cross-Q. 101. You say that during the period when you and he were using "F" and "B," from time to time, Drawbaugh was experimenting to make it better. Did he make it better during that time?

A. I think he did.

Cross-Q. 102. You think you heard better at "B" during the last part of the time than you did at first?

A. Yes, sir.

Cross-Q. 103. Much better?

A. Well, better, anyhow.

Cross-Q. 104. But, on the whole, you think that, although he was trying to make them better, he did not get them better during that time. Is not that so?

[*Objected to as assuming exactly contrary to what the witness has stated.*]

A. I think he did improve it—make it better.

Cross-Q. 105. But you think it was very little better, don't you?

[*Objected to as assuming, and for the same reason as the preceding objection.*]

A. I think it was better.

Cross-Q. 106. When did you last see any of these instruments before this week?

A. I could not exactly say when.

Cross-Q. 107. State as near as you can.

A. Last fall.

Cross-Q. 108. Who showed them to you?

A. Mr. Jacobs. Mr. Drawbaugh was along.

Cross-Q. 109. Where was it?

A. At 1222 Wallace street, Harrisburg.

Cross-Q. 110. Have you ever made an affidavit about them ?

A. Yes, sir.

Examination taken, reduced to writing, and by the witness subscribed and affirmed to before me, May 18, 1881.

FRED. M. OTT,
Examiner.

JNO. C. SMITH.

LEVI CHARLES STEINBERGER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I was born in 1830. I reside now in Perry county. I am farming now. I am a miller by trade.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him since 1871.

Q. 3. Did you at one time reside at Eberly's Mills? If so, when did you begin to reside there, and how long did you continue to reside there?

A. I moved there in 1871, February the first. In October of the same year I moved away again.

Q. 4. State whether you have ever been in Mr. Daniel Drawbaugh's shop at Eberly's Mills since you moved away from that place in October, 1871.

A. No, sir.

Q. 5. Were you in his shop while you lived at Eberly's Mills?

A. Yes, sir.

Q. 6. When you were in his shop, at that time, did you see anything there which he called a talking-machine?

A. Yes, sir.

Q. 7. Please look at the two machines now shown you marked "B" and "F," and state whether you ever saw them before to-day, and if so, state when and where you first saw them.

A. I have seen them in his shop, while I lived at Eberly's Mills.

Q. 8. Who showed them to you there?

A. Hiram Drawbaugh. His right name is Harman Drawbaugh, a nephew of Daniel Drawbaugh.

Q. 9. While you lived there at Eberly's Mills, did you have any talk with Daniel Drawbaugh about his talking-machine?

A. Yes, sir.

Q. 10. Did he tell you how far he could talk through it?

A. Yes, sir.

Q. 11. Did you hear anybody talk through it?

A. No, sir.

Q. 12. Did he or Harman Drawbaugh tell you that it had been used to talk through?

[*Objected to as incompetent.*]

A. Yes, sir.

Q. 13. Did they tell you how far they had talked through it?

A. Yes, sir.

[*Same objection.*]

Q. 14. How far did they say they had talked through it?

[*Same objection.*]

A. Suppose this was the machine-shop; they had talked up to the upper story.

Q. 15. How far did Mr. Drawbaugh say he could talk through it?

[*Same objection.*]

A. He said if it was in operation, he could talk to me up at the grist-mill, from his shop.

Q. 16. How far was the grist-mill from his shop?

A. I don't suppose it was a quarter of a mile; I could not exactly say. Somewhere in the neighborhood of a quarter of a mile.

Q. 17. What business were you engaged in while you lived at Eberly's Mills?

A. I was running the Eberly mills.

Q. 18. Was that the grist-mill Drawbaugh said he could talk to from his shop?

A. Yes, sir.

Q. 19. When did you next see these two machines "F" and "B"?

A. Last fall.

Q. 20-1. Who showed them to you last fall, and where was it?

A. Mr. Drawbaugh and Mr. Jacobs, at my place.

Q. 22. State whether you had ever seen Mr. Drawbaugh from the time you lived at Eberly's Mills until he and Mr. Jacobs visited you at your place last fall.

A. No, sir.

Q. 23. What time in the fall was it that they visited your place?

A. I think in November.

Q. 24. Do you recollect whether there was snow on the ground or not?

A. Yes, sir; there was snow.

Q. 25–6. Please look at the two instruments now shown you, marked "C" and "I," and state whether you ever saw them, or either of them, before to-day, and if so, when and where you first saw them.

A. I seen them in Drawbaugh's shop when I seen the others.

Q. 27. When did you next see them after that?

A. Not 'till to-day.

Q. 28. Where did you see them first to-day?

A. This one I seen over yonder at Mr. Jacobs' office, [indicating "I"]; this one [indicating "C"] I did not see until I came into this room here.

Q. 29. Was this instrument, "I," in Mr. Jacobs' office when you first went in there this afternoon?

A. No, sir.

Q. 30. Was it brought in while you were there?

A. Yes, sir; I asked to see it.

Q. 31. State whether or not, when looking at the instruments "F" and "B" in Mr. Jacobs' office, this afternoon, you said there was another instrument that you saw there, at the shop in 1871, and described this box "I," so that Mr. Drawbaugh came and got it for you.

[*Objected to as incompetent.*]

A. Yes, sir; that is so.

Cross-examination waived.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 18th day of May, 1881.

FRED. M. OTT,
Examiner.

L. C. STEINBERGER.

Adjourned until ten, A. M., May 19th, 1881.

PHONE COMPANY,-1

May 19, 1881, *ten*, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

DANIEL FETTROW, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Fifty-one years on next July 24th; reside at Eberly's Mills. I am a blacksmith.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him personally since the fall of 1865.

Q. 3. Where is your blacksmith-shop? Is it at Eberly's Mills, and if so, how far is it from Drawbaugh's shop?

A. It is at Eberly's Mills, and about four hundred yards from Drawbaugh's shop.

Q. 4. How long have you occupied it as a blacksmith-shop?

A. Since 1866.

Q. 5. Do you recollect doing any work for Wilson Bear at about the time he was commencing to make axles at Drawbaugh's shop?

A. I did work for him March 26th, 1875.

Q. 6. Was that the first work you did for him?

A. Yes, sir.

Q. 7. How do you fix the date?

A. By the charge made in my book.

Q. 8. If you have your book here, please show it to the examiner so that he can copy it on the record.

[*Witness produces his book of accounts and turns to pages which he says are in his handwriting. These pages contain an account headed* "*W. Bear & Co.,*" *which the witness says means Wilson Bear & Co. Said account contains charges every few days, of bolts, iron, cast-steel, and blacksmithing work. The first date given is March* 26, 1875, *and the account extends on various pages through the entire year* 1875. *Witness says the account then went into the name of another company, and he points to another page headed* "*Captain Moore,*" *containing an account of blacksmithing work and materials, the first date in which is May* 12, 1876. *The last entry in said account on said page is in September*, 1876.]

A. (Witness testifies.) Moore was winding up the axle business in the summer of 1876. Wilson Bear was not the inventor of these axles.

His father-in-law, Jacob Kline, was. Wilson Bear run it for a while, 'till his money gave out and he could not carry it on. Then Captain Moore took possession of all there was there and wound up the business. It was while Captain Moore was winding up the concern that I made the charges against him. Captain Moore was the superintendent, or something, at the academy at Camp Hill.

Q. 9. Did you purchase some real estate from Daniel Drawbaugh during the time covered by your last answer?

A. Yes, sir.

Q. 10. Do you remember when you got the conveyance of that real estate?

A. I got the deed April 1, 1876.

Q. 11. Did you move on to the property at that time?

A. I moved out of one house into the other at the time when I got the deed. I lived on the property before that.

Q. 12. Do you remember about what time it was when you agreed with Mr. Drawbaugh to buy that property from him?

A. Yes, sir.

Q. 13. When was it, as nearly as you can remember?

A. August before I got the deed; August, 1875.

Q. 14. About the time that you came to that agreement, or understanding, with Mr. Drawbaugh, that you would buy the property, you were in his shop, occasionally, I suppose, were you?

A. Yes, sir; often.

Q. 15. Did you ever see any talking-machines in his shop?

A. Yes, sir.

Q. 16. State how he come to show you the talking-machines the first time you saw them.

A. The time that Bear was starting this axle machinery Drawbaugh was rather counted as the head man of getting up the machinery; that is, putting up the shafts, and Drawbaugh came to me and told me to come down to the shop, to show me to make some levers, and I went down. After he had showed me how they were to be made, and I was just in the act of leaving the shop, he said to me, "Oh, Daniel! see here," and he went on ahead, around into another apartment of the shop; then he showed me this machine, which was then called the talking-machine amongst us at home there. Then he showed me how to hold it to my mouth and to my ear, and then he went around into another room, and then he spelled Harrisburg; after he was done with that he sang notes. Then I said into this machine, "All right," then he came back to me.

Q. 17. Did you distinctly hear and understand him when he was spelling and singing into the machine?

A. Yes, sir.

Q. 17½ When he came back to you, did he say whether he heard you, when you said "All right" into the machine?

A. Yes, sir; he did.

Q. 18. Please look at the machines now shown you, marked "A," "B," "C," "D," "E," "F," "G," "H," "I," "J," "K," "L," "M," "N," "O," and see if you find the machines by which you and Mr. Drawbaugh talked to each other at that time, as you have testified.

A. Figures were not mentioned at that time, but there was a curl on like that [taking up "D."] I would not just positively say that is the one, but it was just like that. Now here is one [taking up "E"] that when you take the lid off is just the same way, so that I could not positively say.

Q. 19. Do you remember whether the instrument Mr. Drawbaugh talked into was like the one you listened at, or did you see the instrument he talked into?

A. No, sir; I did not see that one.

Q. 20. I understand you that you used the same instrument to listen at and to speak into. Am I correct?

A. Yes, sir.

Q. 21. How did the size of that instrument compare with the size of this instrument "D"?

A. As near as I can tell, it was the same size. It had a mouth-piece the same as that.

Q. 22. State what conversation you and Mr. Drawbaugh had about the talking-machine at that time.

A. After he had talked to me through the machine, he came back to where I was, and he said that this would go ahead of telegraphing. He said then that if I would want to telegraph to anybody, I would have to pay so much a word, and with this machine (meaning the speaking-machine, as we called it then) I could, for five, six, eight, or ten cents, speak myself to the man or person that I would want to talk to myself, and it would be cheaper than telegraphing.

Q. 23. Was anything said at that time about how far you could speak with this machine?

A. Yes, sir; he said I could speak ten, fifteen, or twenty miles, or even to California, if there was a wire extended.

Q. 24. Was anything said at that time about patenting the invention? If so, what?

A. Yes, sir; I asked him whether he had a patent, and he said not. He said he had not the money, but he said he had talked to a couple of men to go in with him to get it patented.

Q. 25. Why did you not go in with him at that time to get a patent on it?

A. Because I had not the money just in my hand to pay it over.

Q. 26. You had heard his talking-machine spoken of in the neighborhood before, had you?

A. Oh, yes.

Q. 27. What did people say about it?

A. Called it tom-foolery.

Q. 28. Do you recollect whether you saw these two instruments, "B" and "F," at the shop at or about that time?

A. This here one I seen. I don't know whether he called it "B" or "F," but that one I saw [indicating "B"]. I have no positive recollection of the other. I might have seen it. [The witness picks up instrument "F," and then says:] I did see that; I remember it after picking it up.

Q. 29. Do you recollect whether you saw this instrument "C" at the shop at any time? If so, when, to the best of your recollection?

A. I can't positively say that I seen that.

Q. 30. Do you recollect at any time seeing this large box "I" at the shop? If so, when, to the best of your recollection?

A. I seen one standing on the counter or bench, after I talked with the speaking-machine; some time afterwards,—I don't mean the same day.

Q. 31. Do you recollect whether at any time you saw this instrument "A" at the shop? If so, when, to the best of your recollection?

A. I have saw a machine lying on the bench like that, too—mouth-piece—with that peculiar-shaped mouth-piece, and some with round mouth-pieces I could not tell you when; it was after we talked together. I never paid no attention before we talked together. I did not see it before that.

Q. 32. Do you mean you did not see the talking-machine until the time when you talked together, as you have testified?

A. I never had seen the talking-machine 'till that time.

Q. 33. From that time when you talked together down to the begining of the year 1880, were you, or were you not, frequently in Mr. Drawbaugh's shop?

A. Yes, sir.

Q. 34. As you would be there from time to time during those years, from the summer of 1875 to the beginning of 1880, did you, or did you not, see other talking-machines that you had not seen in the summer of 1875?

A. Yes, sir.

Q. 35. How often do you think you were in the shop during the year 1876?

A. I might have been there once a month, and maybe once a week for a while. I was back and forward pretty often, as business called me to go there.

Q. 36. How often in the year 1877?

A. About the same as before. Whenever business called me there, I went there.

Q. 37. How often in 1878?

A. I can't answer any other way but the same. Whenever business called me to go to see him for some certain purpose, I went.

Q. 38. And would make the same answer as to the year 1879?

A. Yes, sir.

Q. 39. Please look at this machine "H," having the bell on top of it and the tapering box, and state whether you ever saw it at Mr. Drawbaugh's shop; and if so, give your best recollection as to the time you first saw it.

A. Oh, yes; I have often seen it there. It was after me and him done the talking through the machine that I first saw it. After we done the talking together, and I came into the shop and seen any of those round or oblong mouth-pieces, I took it at once to be a talking-machine.

Q. 40. Did you see a good many machines around there with mouth-pieces, from time to time?

A. Yes, sir.

Q. 41. As you would be in there from time to time during the years 1875, 1876, 1877, 1878, and 1879, would Mr. Drawbaugh generally be doing something to the talking-machines, or with the talking-machines, or not?

A. Yes, sir.

Recess for dinner until 1.45, P. M.

Examination resumed, pursuant to adjournment.

Q. 42. Were you ever in his shop at night when he was there?

A. Yes, sir; but not so often.

Q. 43. About how often, so far as you remember?

A. Maybe once or twice a month. I am not so often out at night; generally at home.

Q. 44. What did you find Mr. Drawbaugh giving his attention to when you were there at night?

A. More on the telephone, or speaking-machine, I should say, than any other thing.

Q. 45. How late did you stay with him, at any time, when he was working on the speaking-machine?

A. As late as ten o'clock at night.

Q. 46. Did he, when you were there at night, give any reason for working on it at night?

A. Yes, sir.

Q. 47. What reason did he give?

A. He said that he could work better at that at night; that his mind was not confused so much with other things as, through the day.

Q. 48. Do you recollect when the electric clock company were making clocks there at his shop?

A. Yes, sir.

Q. 49. Were you in his shop from time to time while the clock-making was going on there?

A. Yes, sir.

Q. 50. Did he show you any speaking-machines there during that time, while the clock company were at work?

A. Yes, sir.

Q. 51. That was about the year 1878, was it not?

A. Yes, sir; somewhere thereabout. If I had my other book here I would give you the exact date when I done the first work for them.

Q. 52. Did you ever do any work for Mr. Drawbaugh in connection with the talking-machines?

A. Yes, sir.

Q. 53. What do you recollect of doing for him?

A. Forging magnets; that is, it was done in my shop through me and my hands.

Q. 54. Did you understand at the time that some of those magnets were for talking-machines?

A. Yes, sir.

Q. 55. You rented a house from Mr. Drawbaugh for some time, did you not?

A. Yes, sir.

Q. 56. From what time to what time did you rent such house?

A. From 1868, eight years following.

Q. 57. 'Till you purchased the house that you live in?

A. Yes, sir.

Q. 58. Was it a house for two families?

A. Yes, sir.

Q. 59. I judge from your testimony that when you bought the house you moved out of one tenement into the other. Is that the fact?

A. Yes, sir.

Q. 60. Was the blacksmith-shop also a part of the property that you rented from him?

A. Yes, sir.

Q. 61. And when you bought, did you buy both tenements and the blacksmith-shop—the whole property?

A. Yes, sir; I bought him out entirely.

Q. 62. What yearly rent did you pay for the property while you rented it?

A. The first year I paid him eighty dollars. The next seven years, a hundred and ten a year.

Q. 63. Will you explain how that rent was generally paid to Mr. Drawbaugh during the time that you occupied that property as tenant?

A. Through work and money paid to him and other persons. I don't know how you would put it.

Q. 64. Do you remember how often you used to settle and balance up the accounts between you?

A. Every year, with the exception of the first year.

Q. 65. When you would settle and strike a balance, how would the balance stand—always in his favor or sometimes in yours?

A. Sometimes in mine—overpaid him.

Q. 66. Did you keep a book account showing what you let him have along from one year to another?

A. Yes, sir.

Q. 67. Have you the book here, and will you produce it and show it to the examiner?

A. Yes, sir.

Q. 68. Please point out to the examiner, so that he can enter upon the record, the various items of money and other things that you let Mr. Drawbaugh or his family have, and charged it on the rent account, during those years that you rented the property from him.

A. Here they are on the following pages: 19, 27, 35 in the first book, and 25, 50, 78, 115, 133, 157 in the second book.

[*Mr. Hill requests the examiner to make and certify to the court, as* "*Exhibit Fettrow account,*" *an exact copy of the account between the witness and Mr. Drawbaugh contained in the books here presented.*]

Q. 69. Please explain the account which I see in the books under the name of "Drawbaugh Pump Co."

A. That was a separate company. The first account mentioned was Drawbaugh's private account.

Q. 70. In Drawbaugh's private account, I observe that you have charged him at many different times with beef, lard, wood, veal, potatoes, coal, corn, butter, flour, and similar articles. Did you keep those articles for sale; and if not, please explain how you came to furnish them to Mr. Drawbaugh or his family?

A. No, sir; I did not keep them for sale, because I have got to buy all myself that I need; because he had not the money, and he came to me to get them for him was the reason I supplied them.

Q. 71. Then you would go and buy them, and furnish them to him and charge them to his account; was that the way it was done?

A. Yes, sir.

Q. 72. Did he always come to you for those articles himself or would his wife sometimes come?

A. His wife sometimes came.

Q. 73. I observe in one or more places on the account, small items of cash charged as "cash to Ellen." Who was Ellen?

A. His wife—called Ellcetta, but I called her "Ellen" for short.

Q. 74. How did she come to go to you for little items of cash?

A. Dan was down at the shop, and she fell in need of money and asked me whether I could not give it to her; that Dan was down at the shop all the time spending his time in these inventions and she must have some money, she said, to keep the family going.

Q. 75. When you purchased the property in 1876, what price did you agree to pay for it?

A. Twenty-two hundred dollars.

Q. 76. Was he to give you an unincumbered title?

A. Clear of all incumbrance was what the agreement asked for.

Q. 77. When you and your lawyer came to examine the title, what did you find to be the condition of it as to incumbrances?

A. Insolvent.

Q. 78. Explain what you mean by its being insolvent.

A. In the first place, I got Mr. Sadler, from Carlisle, to see after the docket and investigate how it was regarding judgments on that property of Daniel Drawbaugh's, and he did, and then wrote to me that I should be careful not to pay any money out; that it was insolvent. Then after that he gave me a list of all the judgments against him—Drawbaugh.

Q. 79. Did you find that the judgments against the property, that were on record, amounted to about as much as the property was worth or not?

A. I found at that time just as much.

Q. 80. I suppose you told Drawbaugh what you had found?

A. I told him of it; yes, sir.

Q. 81. What did Mr. Drawbaugh say and do about some of those judgments when you told him how the title stood on the books?

A. He said that that could not be so, and he went and searched and got them to release one of six hundred dollars, and another one, I can't tell you the amount. I paid him twelve hundred dollars out of twenty-two, and the balance I retain yet.

Q. 82. Do you know what he did with the twelve hundred dollars that you paid him?

A. He bought a property in Mechanicsburg the time that he sold this to me.

Q. 83. What kind of a property in Mechanicsburg—a dwelling-house?

A. Yes, sir.

Q. 84. Did he move his family into it?

A. Yes, sir.

Q. 85. Do you know whether or not he bargained for the property in Mechanicsburg before you paid him the twelve hundred dollars?

A. He bargained in the fall, and I paid him in the following spring.

Q. 86. Did you pay him in the spring of 1876?

A. That spring that I moved in, I paid him.

Q. 87. Do you know how much of the twelve hundred dollars Mr. Drawbaugh paid on the Mechanicsburg property?

A. Yes, sir; one thousand dollars, and the balance by yearly payments—I think three hundred dollars.

Q. 88. You mean you think he was to pay the balance by yearly installments?

A. He was to pay the balance by yearly installments—I think three hundred dollars; that is what I heard.

Q. 89. You have testified that when Drawbaugh showed you the talking-machines, in the summer of 1875, and said he wanted somebody to go in with him and get a patent on it, you did not go in with him on it because you had not the ready money in your pocket. Would you have gone in with him on it if you had had the ready money in your pocket at that time?

A. Yes, sir.

Q. 90. When you paid him the twelve hundred dollars on the property, in the spring of 1876, you must have had some ready money in your pocket. Why did you not go in with him and get a patent at that time?

A. Because I bought the property of him, and knew that I had not enough to pay for that.

Q. 91. Did you have to borrow money to make out your payment of twelve hundred dollars?

A. Yes, sir.

Q. 92. How much?

A. Eight hundred dollars.

Q. 93. Where did you get the other four hundred between the summer of 1875 and the spring of 1876?

A. I collected in money from my customers that was standing out.

Q. 94. Why did not you invest your money in getting a patent instead of investing it in a house to live in, and a blacksmith-shop to work in?

[*Objected to as leading and argumentative.*]

A. Because I always tried to provide for my family before I would reach out too far at other things.

Q. 95. Did Mr. Drawbaugh have quite a family?

A. Yes, sir; more than I ever had together at once.

Q. 96. Did he have considerable sickness in his family at different times, and some deaths?

A. Yes, sir.

Cross-examined by Mr. Storrow:

Cross-Q. 97. Was it Drawbaugh's habit to provide for his family before reaching out at inventions and patents?

[*Objected to as incompetent, argumentative, and indefinite.*]

A. I think he oftentimes neglected it.

Cross-Q. 98. What were the terms of sale of Drawbaugh's place to you?

A. Cash, on April 1, 1876.

Cross-Q. 99. Do you mean that was the agreement you made in August, 1875?

A. Yes, sir; the agreement was this; that he was to give me a title clear of all incumbrances and I was to pay him cash on the first day of April, 1876.

Cross-Q. 100. If I understand you, Drawbaugh owned a house with two tenements, and he lived in one of them and you lived in the other 'till you bought the whole. Is that the way it is?

A. Yes, sir.

Cross-Q. 101. When you and Drawbaugh talked about your going in with him to take a patent, did he tell you how much money he would need, or how much you would have to pay?

A. No; he did not say how much it would take, and I did not ask him.

Cross-Q. 102. You have testified that business took you to Drawbaugh's shop. What was the business that took you there at any time?

A. The business that took me there was, when he wanted to show me the particular way of bending or shaping iron for levers, &c.--different things, combining the whole thing, that he knew that he could not give me to understand plainly by draft.

Cross-Q. 103. I notice in the account which the examiner has to copy off—I mean the account with Drawbaugh in your books—a number of items marked "nail-cutter." What were those for?

A. That was a separate company; Geary, Lee & Co.—Governor Geary.

Cross-Q. 104. What became of those nail-cutters?

A. They fell through and died.

Cross-Q. 105. Who invented them?

A. Drawbaugh.

Cross-Q. 106. How large a settlement is Eberly's Mills—how many houses?

A. Fourteen or fifteen besides the mill.

Cross-Q. 107. Was Mr. M. M. Grove a member of the axle company that you have testified about?

A. There was a Grove in, I learned afterwards, but whether his name was M. M. or not, I do not know.

Cross-Q. 108. Drawbaugh made some special tools or machines to make the axles by, did not he?

A. Yes, sir.

Cross-Q. 109. You testified this morning that the first time you saw instrument "H,"—which is the large sloping one with the bell on top—was after the time when you first saw and heard any talking-machines. How long was it after you first saw and heard any of them, that you first saw "H"?

A. That I can't tell you—how long it was.

Cross-Q. 110. Was it pretty soon or was it a number of years? What is your best recollection about it?

A. To the best of my knowledge, it was within a year from the time when I talked with him through the machine.

Cross-Q. 111. I wish you would read your 74th question and answer and tell me what are the "inventions" that Mrs. Drawbaugh had referred to.

A. That I can't tell you. I was not there to see what she had reference to.

Cross-Q. 112. Did she have reference to any particular invention, or to the idea that Drawbaugh was always at work on some idea or other?

[*Objected to, except so far as Mrs. Drawbaugh stated what invention she referred to, her statements only being evidence.*]

A. She said that he was always sticking down in that shop inventing, and never provides for his family. That is the remark that she made.

Cross-Q. 113. Did she say that to you once?

A. Often.

Cross-Q. 114. Do you mean often during all the years covered by the accounts?

A. Yes, I may say every year a couple of times, she came to the shop complaining.

Cross-Q. 115. In what years was it that you used to see him at work nights on the talking-machine?

A. I can't tell you what years.

Cross-Q. 116. Was it during more than one year?

A. Yes, me and him talked frequently on that subject.

Cross-Q. 117. Was it during more than one year that you used to see him working at the shop at night on the talking-machine?

A. I saw him frequently at that. Then I saw him again that he did not work at it, and told me that when he was by himself at night, that he has a better chance to study about these things, and that he very seldom goes to sleep before midnight; then sleeps in the morning to make up for the fore part of the night. I then told him that that would not suit me, and I would like to sleep in the fore part of the night and get up in the morning. He said it was not so with him, that he does his studying before midnight, and then sleeps the after part.

Cross-Q. 118. You say he told you that he had a better chance to study about these things at night. By "these things," do you mean talking-machines alone, or his inventions generally?

A. It was nothing said in general or talking-machines; he just said inventions. There was no reference exactly to either one.

Cross-Q. 119. A number of instruments have been shown you while you were testifying to-day; when did you last see any of them before this week?

A. I have not been down at the shop for about two months. I have been too busy to get there.

Cross-Q. 120. Have you ever made an affidavit about any of them?

A. Yes, sir.

Cross-Q. 121. When?

A. That I can't tell you—the day.

Cross-Q. 122. State as nearly as you can.

A. It was the after part of last summer, or last fall; I can't tell positively; I did not keep no date.

Cross-Q. 123. You did considerable work for the Drawbaugh Pump

Company, did not you? It was something every few days, was not it?

A. I have done no work for the Pump Company since December 17th, 1870, because at that time, I think, she busted up.

Cross-Q. 124. You did considerable work for them before that, did not you?

A. Oh, yes.

Cross-Q. 125. When did you do the first work for them?

A. 1868, March 31st.

Cross-Q. 126. That is the very first entry in your book, is not it?

A. The very first. That spring I rented the shop from Drawbaugh.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 19th day of May, 1881.

FRED. M. OTT,
Examiner.

DANIEL FETTROW.

Adjourned until ten, A. M., May 20th.

May 20th, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

EPHRAIM R. HOLSINGER *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, thirty-eight years; residence, Saxton, Bedford county, Penna.; I am now a newspaper man, and run a job printing-office.

Q. 2. Did you at one time live at Eberly's Mills, Cumberland county, Penna.?

A. Yes, sir.

Q. 3. Where did you move from when you moved to Eberly's Mills?

A. Harrisburg.

Q. 4. When did you move from Harrisburg to Eberly's Mills?

A. On the 7th day of September, 1873.

Q. 5. When you moved away from Eberly's Mills, where did you move to?

A. Martinsburg, Blair county, Penn.

Q. 6. When did you move from Eberly's Mills to Martinsburg?

A. On the 27th day of November, 1876.

Q. 7. Then you resided continuously at Eberly's Mills from September 7, 1873. to November 27, 1876, did you?

A. Yes, sir.

Q. 8. Did you keep house there?

A. Yes, sir; I did.

Q. 9. State whether you have ever been at Eberly's Mills since you moved away from there in November, 1876.

A. I have not.

Q. 9. While you lived at Eberly's Mills, did you know Daniel Drawbaugh of that place?

A. I did.

Q. 10. How far did you live from his dwelling-house there?

A. Probably fifty steps.

Q. 11. Since you moved away from Eberly's Mills, in November, 1876, how many times had you seen Daniel Drawbaugh before you came here yesterday to give your testimony?

A. Once only.

Q. 12. When was that, and how came you to see him then?

A. July 3, 1880. He came to my place in company with Mr. Jacobs.

Q. 13. While you lived at Eberly's Mills, were you, or were you not, frequently in Mr. Drawbaugh's shop there?

A. I was there frequently.

Q. 14. Do you remember of the Haucks carrying on the faucet business while you lived at Eberly's Mills?

A. I do.

Q. 15. Do you recollect whether they began to carry on that business about the time you moved there, or not?

A. Somewhere shortly after I came there I noticed them there; whether they were operating when I moved there, I do not recollect.

Q. 16 Do you recollect of the axle business being carried on there by Wilson Bear and others, while you were there?

A. I do.

Q. 17. Do you recollect whether Captain Moore had wound up that axle business before you left there?

A. I do.

Q. 18. About how long before you left, to the best of your recollection?

A. My impression is, about the latter part of August, 1876.

Q. 19. When you were in Mr. Drawbaugh's shop, during your residence at Eberly's Mills, did you ever see any talking-machines there? If so, how often?

A. I have saw them very frequently; upwards of fifty times at least.

Q. 20. Do you remember the fact of Daniel Drawbaugh moving his family to Mechanicsburg, while you lived there at Eberly's Mills?

A. I do.

Q. 21. Did you see the talking-machines more frequently before he moved to Mechanicsburg, or afterwards?

A. Most frequently while he lived at Eberly's Mills. I also saw them after he moved away.

Q. 22. Please look at the machines now shown you, marked "B," "F," "I," "A," "D," "E," and state whether you saw them, or any of them, while you lived at Eberly's Mills.

A. These are all plain to me, that I saw all of them; helped Dan to experiment on them.

Q. 23. What were the first ones that you saw there?

A. The tumbler without a bottom and a wooden bowl on top, and the tin can, [the witness points to machines "F" and "B."] Next that I saw there was this one, [taking up "A."] I saw him make this one. These two [taking up "D" and "E"] came next.

Q. 24. State whether or not you saw this box, marked "I," there at one time, and inquired what it was.

A. I have. I asked Dan what it was for; he made no reply. I took it for granted that he did not wish to tell me what it was for.

Q. 25. Was that before or after you had seen the machines "B" and "F," and knew what they were for?

A. Before.

Q. 26. Did you and Mr. Drawbaugh ever operate the machines "B" and "F?"

A. We did.

Q. 27. What did you do with them?

A. We connected them with wires through partitions and floors, spoke into the one, listened at the other. We had them through the partition, and again through two floors into the basement.

Q. 28. When you listened at the one, and Mr. Drawbaugh talked into the other, did you hear and understand distinctly what he said through the machines?

A. Yes, sir; very distinctly. Could tell talking and music apart.

Q. 29. Could you hear and understand the words that were spoken when he talked into the machine?

A. Yes, sir; we would use such words which have similar sounds, knowing them to be more hard to understand than those having more contrast in sound.

Q. 30. After you saw Mr. Drawbaugh making the machine "A," did you take part with him in experimenting with that machine, and listening to see how the words came through it?

A. I did.

Q. 31. How well did that operate?

A. Somewhat better than the first experiment in which I had acted a part.

Q. 32. Did you see him make the machines "D" and "E?"

A. I did.

Q. 33. Did you talk with him through those two machines while you lived there?

A. Yes, sir.

Q. 34. To the best of your recollection, about what time was it when you and Mr. Drawbaugh first experimented with those two machines, "D" and "E?"

A. About the middle of the summer of 1875.

Q. 35. Did you and he, after you first saw those two machines "D" and "E," experiment with them a good deal, or not much?

A. Very frequently.

Q. 36. Did you hear and understand distinctly what was said through those machines?

A. We did; we could speak through this one [holding up "D"] and hear what the other one said with it also; and the same with "E."

Q. 37. Please look at the machines "L" and "M," now shown you, and state whether you saw them, or either of them, during the time when you lived at Eberly's Mills.

A. I saw the magnets; this double-crooked magnet inside, having reference to the bent steel in both—I saw them both. But as to the boxes, the wooden boxes in which the magnets now are, I don't know.

Q. 38. What is your recollection as to the time when you saw the instruments "L" and "M"?

A. A short time before I moved away.

Q. 39. Please look at the instruments "G" and "O," now shown you, and state whether you have any recollection of them.

A. Very little recollection. It seems to me rather doubtful whether I ever saw them.

Q. 40. You have stated that the first time you saw this box "I," Mr. Drawbaugh did not reply to your question as to what it was for. Did you afterwards see it again during your experiments with Mr. Drawbaugh with the talking-machines?

A. Yes, sir.

Q. 41. Did you then find out what it was? If so, what?

A. He placed a magnet in it of some kind, with something else, by which it was calculated to either give sound, or receive, as an experiment. Again he formed it into either an instrument to speak into, or hear from. That is about all I know. We had a wire passing through it, one end of which wire was connected to a small magnet attached to a clock, near the pendulum wire. The other end was attached to a magnet on a bench on the opposite side of the building; the object being to hear the tick of the clock, as the sound would pass over the wire, through this machine "I."

Q 42. Do you recollect whether, at any time, you and Mr. Drawbaugh talked through these machines "L" and "M," or through machines containing magnets similar to those?

A. We never talked through them, to my recollection.

Q. 43. Were you ever in Mr. Drawbaugh's shop at night experimenting on talking-machines with him?

A. Yes, sir; often.

Q. 44. How often?

A. I could not just say how often, but twice I recollect of being there 'till one o'clock. Many times besides, as late as ten and eleven. Sometimes got a good scolding when I got home.

Q. 45. From all you saw of Mr. Drawbaugh's operations and employment during the time that you lived at Eberly's Mills, what was he experimenting on principally?

A. The talking-machine. He appeared to be crazy on it. I often tried to get information from him on other subjects, and about a half a minute's talk would turn him right on the talking-machine. That is about his standing—the way he felt all the time I was there.

Q. 46. State whether he said anything to you, at any time while you lived there, about liking to talk with you on the subject of the talking-machine, and why.

A. He did. Shortly after I came there, I made mention of a certain machine which was considered, by people who think themselves sharp, an impossibility. He said to me that my mind run very much in the same direction that his did, and that I was the only person he came across to whom he felt free to express some of his private ideas.

Q. 47. Did Mr. Drawbaugh, at any time while you lived there, state to you how far he could transmit spoken speech by means of his talking-machines? If so, what did he say?

A. He did; he said as far as wire could be magnetized.

Q. 48. What did he mean by that, as you understood him at the time?

A. That there was no limit to the distance to which it could be done; that you could send it as far as you could put wires.

Q. 49. I suppose that, while you lived at Eberly's Mills, you were acquainted with Mrs. Drawbaugh, the wife of Mr. Daniel Drawbaugh, were you not?

A. I was.

Q. 50. Did she visit your family occasionally or frequently?

A. Our association was frequent from this cause: the spring from which the entire town of Eberly's Mills took their water for house use was against the wall of the house in which we lived; therefore, Mrs. Drawbaugh, in bringing water, would very frequently stop at our door and chat a little.

Q. 51. Did you ever hear her say anything, on any of those occasions, or at any time or times while you lived at Eberly's Mills, about her husband's experiments down at his shop, and if so, what?

A. I did. I heard her say that Dan was at that ——— old shop fooling his time away, while they, the family, hardly knew how to get anything to eat. She also told me, in my office, that she smashed up a lot of photographing and other things about the house, in order to stop Dan from fooling with them.

Q. 52. How often did you hear her make remarks of that character, condemning his persistence in his experimental work at the shop?

A. Just how often, I could not say; perhaps a dozen of times or more. It was pretty often.

Q. 53. In any of your experiments with Mr. Drawbaugh at his shop, did one of you whisper through the machines, or make other noises than talking and singing, to see how they would convey such sounds?

A. We did. We whispered, we scratched on pieces of wood with pieces of old file, we rubbed paper together between our fingers, and then would ask one another whether one could tell what the other one done, or how the noise was made. We asked this through the machines and otherwise. We would hold the paper, or whatever we used, by which the noise was made, to the mouth-piece of the machine.

Q. 54. And could you distinguish through the machine how any of those various noises were made?

A. Most generally.

Q. 55. During those various experiments, about which you have testified to-day, did Mr. Drawbaugh ever explain to you what kind of an electric circuit he used in connection with these talking-machines, so far as you remember?

A. I remember very distinctly of its explanation, but what it consisted of I do not remember, from this fact: that I saw that his machine would be a success, and therefore did not tax my memory with any minuteness with regard to his description or explanation.

Q. 56. Do you recollect anything about his using carbon, either alone or mixed with anything else, in any of his experiments in connection with the talking-machines at that time? If so, what is your recollection?

A. I have a recollection of him forming a small, round, thin plate, or article, which he formed, I think, of powdered limestone and carbon, and perhaps a third substance or ingredient. This he brought to a certain consistency by the aid of heat, after which he placed it inside of a round, hollow, low, wooden vessel, over which he fitted another wooden, flat top; that I do not see here.

Q. 57. Did you understand at the time that it was to be used in connection with the talking-machines?

A. I did. The mouth-piece was one similar to the one on the old glass tumbler ["F"]—was placed over the top of it, after the little carbon machine had been put into a tumbler.

Q. 58. Do you recollect of hearing him say anything about high

PHONE COMPANY,-1

conductors and low conductors, in connection with his talking-machines?

A. I did; but just what he said I do not recollect, more than that he explained the different ways of using the conductors.

Q. 59. When you were experimenting with the instruments "F" and "B," do you recollect whether the end of the tin tube of "B" next to the electro-magnet was closed with anything, or not?

[*Objected to as leading.*]

A. It was closed with a vibrating substance, inside of which was a little sheet of soft iron.

Q. 60. Did Mr. Drawbaugh explain to you at the time how the current of electricity caused the instrument "B" to make or repeat the sounds which you heard in it? If so, what idea did you get of it from his explanation?

A. He explained it to me at different times, but I do not recollect now what he said.

Q. 61. About how long ago do you remember reading in the newspapers, for the first time, an account of a talking-machine by which one man could talk to another to a long distance by means of electricity?

A. About thirteen months ago my attention was drawn to an article by a man looking over my exchanges, in which mention was made, being the Philadelphia daily *Record*, of some one having a machine called the electro-telephone, or something of that kind. I think those were the words used. I replied to the one reading the article that that machine is Dan Drawbaugh's, or one just like it.

[*Answer objected to by Mr. Storrow unless the alleged article is produced or identified.*]

Q. 62. When Mr. Drawbaugh and Mr. Jacobs visited you last summer, as you have testified, what was the nature of the interview between you and them?

A. They had a few of these instruments before us with them, which they asked me whether I ever saw them. I told them I had saw them, or others just like them, and they asked me to give my affidavit to that effect, which I did. Very little conversation of any kind took place, they not being there in my presence over two hours.

Recess for dinner until 2.15, P. M.

May 20, 1881, 2.15, P. M.

Examination resumed.

Present, same counsel.

Q. 63. During the progress of the experiments which you and Mr. Drawbaugh made with talking-machines while you lived at Eberly's Mills, was anything said about patenting the invention? If so, what?

A. There was. I asked him whether he was getting a patent on it. He said he would as soon as he would be able; that is, as soon as he could get money to pay for it.

Q. 64. Do you recollect whether anything was said between you and him, at the time you lived at Eberly's Mills, about his making efforts to get others to go in with him to furnish the money in order to take out a patent on his talking-machine? If anything was said about it, what was it?

A. I remember of him several times telling me that if he could get parties who he could trust, he would give them a fair interest in it, but he said that those who had the money did not appear to see that the invention would amount to anything, and he still thought that he would add other improvements to it, which would be necessary to make it complete, and if he got a patent on it in the way it was, it would cost extra to add the improvements, and for that reason he did not make any extra efforts to get the money.

Q. 65. Was there a man by the name of Daniel W. Smith at one time at work for you, while you lived at Eberly's Mills?

A. There was.

Q. 66. What was he doing for you?

A. He was helping me in the printing office.

Q. 67. What time did you commence printing at Eberly's Mills?

A. About the first of May, 1874.

Q. 68. When did Smith work for you?

A. He commenced about the middle of November, 1874.

Q. 69. How long did he work for you?

A. About two months.

Cross-examined by Mr. Storrow:

Cross-Q. 70. What was your business in Harrisburg before you moved to Eberly's Mills?

A. I worked in the State printing office for Mr. Singerly.

Cross-Q. 71. Whereabouts in Harrisburg did you live?

A. Near the corner of Third and Chestnut streets.

PHONE COMPANY,-1

Cross-Q. 72. What occupation did you have at Eberly's Mills, besides helping Drawbaugh with his talking-machines?

A. I had a job printing office in which I done job printing.

Cross-Q. 73. Did you own a house there, or whose house did you live in?

A. I rented a house from George Leonard.

Cross-Q. 74. Who took the house when you left?

A. That I do not know, I have not been there since.

Cross-Q. 75. What did your household consist of?

A. My family only.

Cross-Q. 76. Do you mean your wife and children only?

A. Yes, sir.

Cross-Q. 77. Did you have any relatives at Eberly's Mills?

A. No, sir.

Cross-Q. 78. Why did not you keep Smith with you more than two months?

A. He became dissatisfied with his position and quit.

Cross-Q. 79. You were well enough pleased to have him quit, were not you?

A. I was satisfied.

Cross-Q. 80. You found he was lazy and shiftless and not good for much, did you not?

A. I never said so; a silent question.

Cross-Q. 81. You thought so, did not you?

[*Objected to as incompetent, irrelevant, and immaterial.*]

A. I never expressed myself. I always thought it best to keep quiet on subjects of that character.

Cross-Q. 82. Do you prefer not to answer the last question any further?

[*Objection repeated.*]

A. I do.

Cross-Q. 83. His wife left him on account of his conduct, did not she?

[*Same objection.*]

A. I do not know whether she left him for that, or not.

Cross-Q. 84. You understood that that was the reason, and heard so, did not you?

[*Same objection.*]

A. I never heard—never bothered myself anything about other people's business.

Cross-Q. 85. That was the common report, was not it?

[*Same objection.*]

A. I know nothing about those reports.

Cross-Q. 86. I don't ask you whether the report was true. I ask you whether you did not hear that report about him, or whether that was not the report about him?

[*Same objection.*]

A. There may have been such a report, but, to my recollection, I do not know anything about it; to unpleasant things I always turn a deaf ear.

Cross-Q. 87. Where did you move to when you left Eberly's Mills?

A. Martinsburg, Blair county, Penna.

Cross-Q. 88. What was your occupation there?

A. Printing.

Cross-Q. 89. Did you have a shop of your own, or work as a journeyman?

A. I rented a house and used my own material.

Cross-Q. 90. How long did you stay there, and where did you go to next?

A. I remained in Martinsburg two years. I next went to Cove Station, and followed up job printing there for about six months, when I moved to Saxton, at which place I now reside, in the same business.

Cross-Q. 91. Have you never seen any of the Eberly Mills people since you moved away from there?

A. No one except Dan Drawbaugh, and him once only—talked with him, perhaps one half hour, on the third day of July, 1880.

Cross-Q. 92. Any letters ever pass between you and any of the Eberly Mills people since you left?

A. Very few; two, I think, only.

Cross-Q. 93. Who were those from?

A. One was from a little girl who used to be at our house frequently, while we lived at Eberly's Mills; and the other one was from William Dellinger, both being sociable family correspondence.

Cross-Q. 94. Did you ever hear anything about Drawbaugh, or about his talking-machines, between the time you moved away from Eberly's Mills and the time he came to see you last summer?

A. I did not.

Cross-Q. 95. Who was it called your attention to the article which you say was in the Philadelphia *Record* thirteen months ago?

A. David B. Weaver.

Cross-Q. 96. Is he a Saxton man, or a man from this part of the country?

A. He lives in the neighborhood of Saxton; a man taking great interest in new inventions; reads many scientific papers, and therefore notices almost everything new that comes out.

Cross-Q. 97. How do you fix the time as thirteen months ago, which would bring it in April, 1880?

A. Will you please notice that I said the man who noticed it was looking through my exchanges? Whether it was a paper of 1880, or an older one, I do not recollect—did not look at the date of it. The time at which Mr. Weaver was in my office was when he was plowing his ground for corn, and it being the first spring in which he came to my office, that fixes the time.

Cross-Q. 98. Was April, 1880, the first time that you ever heaad of the existence of the electric speaking-telephone, other than those which you say you saw at Mr. Drawbaugh's shop?

A. For that I would not like to say, for the fact that Drawbaugh had this machine, and me knowing it, mention might have been made of one, without attracting my attention, having plenty to do to keep myself a moving. I could not read or think as much as I would have liked to do.

Cross-Q. 99. Who was present at any of these times when you and Drawbaugh were experimenting with talking-machines, while you lived at Eberly's Mills?

A. I do not remember of any particular person.

Cross-Q. 100. While you were at Eberly's Mills, did not Drawbaugh say something to you, that he had heard somebody else had made a speaking-machine, or telephone?

A. Not to my recollection. If he had, I would undoubtedly have remembered it.

Cross-Q. 101. Did not he tell you that somebody else had got a patent for one?

A. He did not. I did not know that it was patented until within a few days ago—did not bother myself any about it. I did not ask Drawbaugh or Mr. Jacobs, last summer when they were with me, whether it was patented or not.

Cross-Q. 102. Did not they tell you what they wanted your affidavit for?

A. They told me that other parties were contending for the same invention and they thought that Dan's invention was made before the other parties, and they were trying to prove priority of invention.

Cross-Q. 103. Did they tell you that other parties were trying to get a patent on the machine?

A. I think not.

Cross-Q. 104. Did they tell you that other parties had got a patent on it?

A. No, sir; I would not have said I did not know that there was a patent on it.

Cross-Q. 105. Did Drawbaugh have any talk with you last summer about his chances for getting a patent on the machine?

[*Objected to as incompetent, irrelevant, and immaterial.*]

A. I asked Dan Drawbaugh about it. He said, "I do not know what the chances are;" that is all I know about that.

Cross-Q. 106. You told him you were glad that at last he had found somebody to take it up and furnish the money, did not you?

[*Same objection.*]

A. I did. I always feel glad when I see my friends get along—do yet, though that has nothing to do with his getting along.

Cross-Q. 107. You asked him how the people who were interested with him came to take it up, and agreed to furnish the money, did not you?

[*Same objection.*]

A. I think not. I don't know anything about it; at least I could not now state why it is so, nor how it is, at this moment. I do not know.

Cross-Q. 108. While you lived at Eberly's Mills, was not Drawbaugh capable of earning all he needed, if he would only work steadily?

A. Yes, sir. He did work steadily, intently—never lost one moment, but, influenced by some supernatural or other power, did not happen to work at such things as did, or would, bring him the required necessaries for the sustenance of himself and family.

Cross-Q. 109. What things did he work at?

A. He put a great deal of his time in experimenting on his talking-machine. In fact, so near all his time that he got very little earned.

Cross-Q. 110. What other inventions was he working on during the three years and a quarter that you lived at Eberly's Mills?

A. I do not remember of anything that he was working on, except a magneto-electric machine, but whether he worked on that as an invention while I was there, or only completing a former invention, I do not know. That is about the substance of what I know about his inventions.

Cross-Q. 111. You have described the wires which you say you and he talked over with these machines. Did you help him to put them up, or did you see him put them up?

A. I did not describe any wire. I did not help him put them up. He generally got things ready, then told me to come and help him.

Cross-Q. 112. Who run the grist-mill while you were there?

A. George Leonard was proprietor and employed different men. I could not say who they all were. This was when I went there. About the first of January, 1876, William Dellinger and a Mr. May,—I don't know his name,—on some conditions, bought the mill, and were running it when I left.

Cross-Q. 113. Did Mr. George Leonard own other property there, besides the mill and the house you lived in?

A. Yes, sir; he owned the house he lived in, and several other houses, and a few acres of ground—just how much, I do not know.

Cross-Q. 114. Who kept the store during the three years you lived there?

A. In full there was no store kept during the three years while I was there. Abner G. Wilson had store there for a while, but, having a keg of powder too near the fire, blowed him up, or the goods. Some lit, and some did not; some burned up before they lit. It so completely busted the shell of the house in which it was, that he left and never returned. After which, perhaps a year, a new shell was prepared to keep store, in which Jeremiah Fry kept some few articles. That is all I recollect of the store business at Eberly's Mills.

Cross-Q. 115. Who worked in the store when Fry kept it?

A. Mr. Fry and his family.

Cross-Q. 116. Who was with Wilson in keeping the store?

A. A circumstance, which I will not relate, caused a dissolution of partnership between Johnst. Leonard and A. G. Wilson, after which Wilson attended to it himself.

Cross-Q. 117. Who kept the Post Office, and where was it kept?

A. When I first went there, George Kissinger lived in the store house. I think that was his name,—and he kept it; next, Wilson kept it in the store; then Fry took it—had it when I left.

Cross-Q. 118. What railroad station did the Eberly Mills people use, and was there a mail-cart or any regular conveyance to it?

A. They used White Hill station on the Cumberland Valley road. They got their mail there every day—carried it by foot power. Kissinger carried it until he left—about the first of May, 1874. After that, witness was honored with the mail messengership. for the following two years. When I left, a young Mr. Fry carried it.

Cross-Q. 119. Was there a carpenter lived at Eberly's Mills? If so, who was he?

A. There was none there, that I know of.

Cross-Q. 120. Please tell me the rest of the householders who lived there while you did.

A. I am unable to do so. I could not tell. I could mention a few. There was continual moving there and away.

Cross-Q. 121. Name those whom you do recollect.

A. J. B. Drawbaugh, George Drawbaugh, Daniel Fettrow, Daniel Drawbaugh, ——— Frownfelter,—his first name I do not know,—Michael Kohn, John Rennard, Harry Lewis, Jacob Zimmerman, Daniel Wesley Smith, William Dellinger, George Leonard, Jacob Evans, John Smith, Sr., ——— Bowman. That is all I can recall now. There were others there, but I can't recollect their names.

Cross-Q. 122. Who kept the school that the children went to?

A. I am unable to call the names to my memory.

Cross-Q. 123. Who was the shoemaker while you were there?

A. No regular shoemaker there; a good many cobbled around a little sometimes.

Cross-Q. 124. Who kept the cobbler shop?

A. They had no shops. They done it in their kitchens. I suppose that is the cobbling.

Cross-Q. 125. Please look at the machines now shown you, marked "C," "H," and "J," and tell me whether you ever saw any of them before to-day.

A. I have some faint recollection of seeing this one ["C."] The others I know nothing about.

Cross-Q. 126. Please look at these now shown you, "K" and "N," and tell me whether you ever saw them before.

A. I never saw them.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 20th day of May, 1881.
FRED. M. OTT,
Examiner.

E. R. HOLSINGER.

Saturday, May 21, 1881, 10, A. M.

Examination resumed pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

ROBERT J. STRONG, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. I am twenty-seven years of age; reside at Shiremanstown, Cumberland county, this State; farming is my occupation.

Q. 2. What was your occupation in the years 1875 and 1876?

A. Teaching.

Q. 3. At what school were you teaching in those years?

A. The Cedar Spring school.

Q. 4. Besides the name of Cedar Spring, had that school any numerical denomination, or was it known by any other name, other than Cedar Spring?

A. It was—as Gorgas' school; it was also known as No. 2.

Q. 5. When did you commence and when did you discontinue teaching at that school?

A. I commenced September 13th, 1875. I discontinued in March, 1876.

Q. 6. While you were teaching at that school, did you ever pay a visit to Daniel Drawbaugh's, at the shop where he was working, at Eberly's Mills?

A. I did.

Q. 7. State when, and the object of that visit.

A. In November of 1875, to have a gun repaired.

Q. 8. While you were there, did you see any instruments called talking-machines?

A. I did.

Q. 9. Who showed them to you?

A. Mr. Drawbaugh.

Q. 10. Did he tell you whose invention they were?

A. I can't remember whether anything was mentioned in that respect.

Q. 11. What parts of the instruments, or their connections, do you recollect having seen?

A. Wires, or a wire and an armature magnet.

Q. 12. To what part of the premises were these wires attached?

A. To the wall or partition at the shop.

Q. 13. And from the wall or partition, whence were they led?

A. I do not know.

Q. 14. Did Mr. Drawbaugh explain to you the principle on which his talking-machine operated?

A. He did not.

Q. 15. Why were you specially attracted to the wires and the armature magnet?

A. Mr. Drawbaugh's mentioning it, and being studying in that part of philosophy that bore upon that subject.

Q. 16. Do you mean that you were at that time studying philosophy bearing upon that subject, and that that was the reason you were specially attracted to the wires and the armature magnets?

A. Yes, sir; I was studying the subject of magnetism.

Q. 17. Did you leave your gun with Mr. Drawbaugh that day?

A. I did.

Q. 18. When did you go for it again?

A. Several days after.

Q. 19. Have you ever been to the shop since?

A. No, sir.

Q. 20. Are you acquainted with Mr. D. A. Hamacher?

A. Yes, sir.

Q. 21. Do you recollect a visit that he made to your school while you were teaching in 1876, in company with some young men?

A. I do.

Q. 22. Do you recollect the month or the day?

A. I do the month; it was February.

Q. 23. Do you recollect how many persons were with him, or the names of any of them? If so, state them.

PHONE COMPANY,-1

A. I do not, how many, but those of John F. Rupp and Forrest Shank.

Q. 24. Did Mr. Hamacher say where he was going after he left you?

A. Yes, sir; he said he was going to Drawbaugh's machine-shop.

Q. 25. Did he call on you with his companions after his return from Mr. Drawbaugh's?

A. He did, in company with Mr. John F. Rupp.

Q. 26. Did he tell you what he had seen there?

A. Yes, sir; he said he had seen a talking-machine.

Q. 27. Did you say anything to him about your having seen such a machine there?

A. I said, Mr. Drawbaugh said that he had such a machine.

Q. 28. Whom did you tell Mr. Hamacher that Mr. Drawbaugh had said that to?

A. I said he told me it.

Q. 29. I will show you now a book called Teachers' Monthly Reports for School No. 2 in Lower Allen District, Cumberland county, Pennsylvania, and I will ask you to examine the report for the lunar month ending February 14th, 1876. State whether the certificate dated February 14th, 1876, is signed by you, and tell me in whose handwriting all the blanks are filled up that precede that certificate.

A. Yes, sir.

Q. 30. There is a receipt at the foot of the right-hand page, dated the 25th day of March, for forty dollars. Is that receipt signed by you?

A. Yes, sir.

Q. 31. I notice on the 31st day of January, in the days of the month, under the head of "Attendance," Monday stated to be the 31st of January. Monday is also stated to be the 1st of February. Will you please state how the error occurred?

A. It occurred by transferring it from a memorandum sheet to the report, by writing the wrong day of the week.

[*By consent, a certified copy of said report is put in evidence, to stand in place of, and have the same effect as, the record in the book. Said copy is marked "Hamacher's Exhibit."*]

Cross-examined by Mr. Storrow:

Cross-Q. 32. Then I understand that you kept your records on sheets of paper, and that this book is only a copy of them. Am I correct in that?

A. Yes, sir.

Cross-Q. 33. Can you tell me what day of the week the first of February, 1876, was? Look at the book if that will help you any.

A. It would be Tuesday, by the book.

Cross-Q. 34. Now, will you look at the boy's side, and tell me how you succeeded in getting the 28th of January into the same week in which you say the first of February came on Tuesday?

A. I did not get it in, by my understanding of this report.

Cross-Q. 35. Look on the boy's side and tell me what day represents Tuesday, the first of February.

A. Here, marked Monday, January the 31st.

Cross-Q. 36. The day before that, on the boy's side of the report, is marked Monday, January the 28th; what did you do with the intervening days?

A. This is a mangled report. I can't answer for that work there.

Cross-Q 37. I see you have testified that your name is "Robert J. Strong." Did you have any particular reason for omitting the "J," when you signed these reports? I notice that they are all signed "Robert Strong," and that the pages are all headed "Robert Strong."

A. No, sir; more than that, I occasionally write it "Robert Strong."

Cross-Q 38. Did Mr. Drawbaugh's children go to that school to you?

A. Yes, sir.

Cross-Q. 39. I notice the name of Ida Zacharias among the scholars. Was she a daughter of Mr. John J. Zacharias?

A. To my knowledge, she is a daughter of John Zacharias.

Cross-Q. 40. I suppose you mean that you don't know whether he had a middle name, or not?

A. No, sir; I do not know whether he had a middle name or not.

Cross-Q. 41. He used to visit your school occasionally, did not he?

A. He did several times.

Cross-Q. 42. Mr. Scherich used to visit your school occasionally, did not he?

A. He did once to my knowledge.

Cross-Q. 43. The report for the month of February, 1877, in the same book, records the names of Miss Ida Zacharias as pupil, and J. A. Scherich and John J. Zacharias as visitors, does it not?

[*Objected to as referring to transactions that happened one year after the witness had left the school, and cross-examination upon a subject which was not examined in chief is irrelevant and improper.*]

A. Yes, sir.

Cross-Q. 44. The handwriting of the list of visitors in the report for the lunar month ending February 14th, 1876, appears to my eyes somewhat different from the handwriting of the list of names of scholars in that report, and in the preceding report; and therefore I ask you to look at them carefully, and to say whether all of those lists are in your handwriting?

A. Yes, sir; I recognize that as my handwriting at that time—both of the lists of names.

Cross-Q. 45. Mr. Hamacher's name in the report of February, 1876, seems to be written with a finer pen and in a more free and hasty manner than the list of pupils' names. Do you remember whether you did all the writing on the two pages of that report at the same time?

A. I do not, as I fill out my report at leisure time, still.

Cross-Q. 46. Do you mean by that that you take your leisure time, running over a number of days, as may be convenient, to write the report in the book?

A. No, sir.

Cross-Q. 47. Do you mean that you wrote the whole of the report in that book for that month on one day?

A. I do not know whether I did or not.

Cross-Q. 48. I suppose you did not begin to write the report in the book until after the close of the month, did you?

A. I don't suppose I did.

Cross-Q. 49. And therefore, the date of your certificate, February 14th, 1876, is not the date when the report was written out and signed, but merely the date of the close of the month. Is that so?

A. I cannot tell.

Cross-Q. 50. Who was present on this occasion in Drawbaugh's shop when you say you saw the talking-machine?

A. No one except Mr. Drawbaugh.

Cross-Q. 51. When you left off teaching that school, where did you reside?

A. With my parents at home, in Shiremanstown, Cumberland county.

Cross-Q. 52. Have you lived in Shiremanstown ever since?

A. Except when I was at school, and teaching school.

Cross-Q. 53. On the two occasions when you went to Drawbaugh's shop about your gun, what kind of business was being carried on there?

A. I do not know exactly.

Cross Q. 54. Did not you see any men at work on either of those two occasions?

A. None except Mr. Drawbaugh.

Re-direct by Mr. Abraham:

Q. Q. 55. I notice in the book of monthly reports, pasted within the cover, some printed explanations. Had you read them prior to making up your reports?

A. I did not immediately, to my knowledge, before making out the reports.

Q. Q. 56. Had you read them at all?

A. Yes, sir.

Q. Q. 57. I notice the first paragraphs read as follows: "In the new edition of the teacher's monthly reports few changes have been made except those in reference to obtaining the percentage of attendance. To these special attention is directed. As this book is intended to be in use and last five years, it will be necessary as well as proper to have the utmost care taken of it. The marks and writing in it should be carefully made with ink and not with a pencil, and erasures and blots should not be permitted. It will be found safest and best in practice to keep the mouth's record on a sheet of paper ruled for the purpose, and at the end, when the average and percentage have been estimated and entered, to copy it into the book. This course is recommended. A teacher's character is in no small degree indicated by the manner in which the monthly report is kept." Did you in fact keep the record of your school on separate sheet or sheets of paper, and at the end of the lunar month ending February 14th, 1876, make up your report from the separate memoranda kept by you in accordance with the printed instructions within the cover of the report book?

A. That was my custom then, and, to the best of my knowledge, I filled out my report from these memorandum sheets.

Q. Q. 58. Then the entry on your report for that lunar month, which shows Friday, 26th January; Friday, 27th January; Monday, 28th January; Monday, 31st January, are simply clerical errors made by you in transcribing from your original memoranda?

A. They are; yes, sir.

Q. Q. 59. Is it not a part of the duty of the teacher, in making out his reports, to write down the names of the school-directors and citizens who visit the schools during the current month?

A. It is, as I understand it.

Q. Q. 60. You have testified, in reply to cross-question number 43, in regard to a record of certain names in the report of February, 1877; did you ever see that report before to-day?

A. I did not.

Q. Q. 61. Then you know nothing about what transpired in the month ending February, 1877?

A. No, sir.

Re-cross by Mr. Storrow:

Re-cross-Q. 62. The paragraph read to you from the printed explanations says that a teacher's character is in no small degree indicated by the manner in which the monthly report is kept; don't you think it would be rather an unfair criticism always to judge a teacher's accuracy about dates by the reports entered in this book?

[*Question objected to as improper, asking the witness for his opinion as to the effect of a general rule of the school-board on his character and as to the justice or injustice of the rule of the school-board.*]

A. I think it would be rather unjust on the teacher's qualifications as a teacher.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 21st day of May, 1881.
FRED. M. OTT,
Examiner.

ROBERT J. STRONG.

Recess for dinner until 2. 30, P. M.

May 21, 1881.

Examination resumed, pursuant to adjournment.

Present, same counsel.

ADAM HILER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. My age is thirty-nine; residence, Fairview township, Cumberland county, Penna; occupation, a farmer.

Q. 2. Did you ever live at Milltown, sometimes called Eberly's Mills?

A. Yes, sir.

Q. 3. State when, and for how long.

A. One year, 1869.

Q. 4. What were you employed at during that year?

A. I worked by the day, at labor.

Q. 5. Who did you work for?

A. I worked wherever I could get work.

Q. 6. Did you ever work for Daniel Drawbaugh?

A. I did; yes, sir.

Q. 7. What did you do for him—what kind of work?

A. Planted his potatoes.

Q. 8. How long were you engaged planting potatoes for him?

A. One day.

Q. 9. Do you know why he employed you to plant his potatoes, and did not do it himself?

A. No, sir.

Q. 10. Did you go into his shop while you were down there at that time?

A. I was there once.

Q. 11. Did he tell you anything then in reference to a talking machine that he was working on?

A. No, sir.

Q. 12. Did he tell you anything at any time in reference to a talking-machine?

A. Yes, sir.

Q. 13. When was that?

A. In 1869.

Q. 14. Where was it that he told you?

A. On the mill-bench, at the mill.

Q. 15. What did he tell you that he intended to accomplish by his machine?

A. He had calculated to invent a machine to talk.

Q. 16. Did he tell you anything about the distance that he could talk through his talking-machine?

A. Yes, sir.

Q. 17. What did he say about the distance?

HONE COMPANY,-1

A. He said he could stand here at White Hill and talk to his brother, the 'Squire, at Mechanicsburg, quite handily.

Q. 18. Do you recollect what you charged him for planting his potatoes?

A. No, sir; not exactly I don't.

Q. 19. Tell us, as near as you can, how much he owed you for planting the potatoes.

A. Of course I would not work for less than a dollar a day.

Q. 20. You were only engaged one day?

A. At that time.

Q. 21. Did you work for him again?

A. Yes, sir.

Q. 22. At what kind of employment?

A. Dug his garden.

Q. 23. How long were you employed at that?

A. Two days and a half.

Q. 24. Do you know what your charge was for that second employment?

A. I suppose it was a dollar a day; two and a half for that job.

Q. 24½. Did he pay you pretty promptly for planting his potatoes and digging his garden?

A. I had to wait till I got it.

Q. 25. How often did you ask him for it?

A. Not less than three times, anyhow.

Q. 25½. Why didn't he pay promptly?

A. Because he did not have it.

Cross-examination:

Cross-Q. 26. Where did you go to live after you left Eberly's Mills?

A. Well, I moved within a mile of Lisburn;—about three miles from the place I did live, in the same county.

Cross-Q. 27. Do you mean three miles from Eberly's Mills?

A. There's where I did live; yes.

Cross-Q. 28. How long did you live there and where did you go to next?

A. I moved from there to York county.

Cross-Q. 29. To what place in York county?

A. Shoffnerstown.

Cross-Q. 30. How far is that from Eberly's Mills?

A. I suppose about two miles and a half.

Cross-Q. 31. How long did you stay there, and where did you move to next?

A. I staid four years there and moved within a mile of Lewisberry, which was about five miles from Eberly's Mills.

Cross-Q. 32. How long did you live there and where did you go to next?

A. Four years, and then I moved back on the same road.

Cross-Q. 33. Where did you move to?

A. I moved to Epply's place. Epply owned the property.

Cross-Q. 34. How far from Eberly's Mills was that?

A. That was about three miles and a half.

Cross-Q. 35. How long did you live there, and where did you move to then?

A. I lived there one year, and moved to where I live now.

Cross-Q. 36. How long have you lived where you are now?

A. One year in April. This is the second year.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 21st day of May, 1881.

Examiner.

his
ADAM X HILER.
mark

Adjourned until Monday, May 23, 1881, at 10 o'clock, A. M.

Monday, May 23, 1881, 10 *o'clock*, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill, Mr. Abraham, and Mr. Jacobs for respondents.

HENRY BONHOLTZER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. Fifty years old the 7th of May last; Steelton, Dauphin county blacksmith.

Q. 2. Are you acquainted with Mr. Daniel Drawbaugh, of Eberly's Mills?

A. Yes, sir.

Q. 3. Are you a joint inventor for a reaper knife with some other gentleman?

A. Yes, sir.

Q. 4. State the name of that gentleman and the time when said invention was patented.

A. Jacob Shopp; May the 18th, '69.

Q. 5, Did you make another invention in connection with Mr. Shopp and have it patented? If so, please state the date of this latter patent.

A. Yes, sir; 14th of September, in the same year.

Q. 6. Who helped you prepare the model for this later invention?

A. I prepared them mostly myself, and, also, Mr. Drawbaugh gave me some instruction.

Q. 7. Where were you when Mr. Drawbaugh gave you the instruction; and who, if anybody, was with you at the time?

A. Well, I was at his shop—at his place at Milltown, and Mr. Shopp was along with me.

Q. 8. State, as nearly as you can, the time when this interview occurred at Mr. Drawbaugh's shop.

A. It was in June—the early part of June—can't just mention the date. I was working then at Lancaster City, making some of those knives at the time; Mr. Diller's shop in Lancaster City.

Q. 9. You mean, then, that that was after you got out your first patent, and before you got out your second one; am I right?

A. Yes, sir; after we got out our first patent and before we got out our second one.

Q. 10. Did you go there more than once to consult Mr. Drawbaugh in reference to your second invention?

A. Yes, sir.

Q. 11. About how many times?

A. From June to September, I sent Mr. Shopp there, and was there myself during that time half a dozen times. I sent Mr. Shopp there twice a week.

Q. 12. How many times did you go there with Mr. Shopp?

A. Well, I can't just state how many times I went with him. Every time I went, he was along with me, and every time he went, I was along with him, so we both went together.

Q. 13. At any one of these visits, do you recollect Mr. Drawbaugh speaking to either of you about a talking-machine?

A. He was speaking to Mr. Shopp—showing the machine to Mr. Shopp—and, at the same time, I paid small attention to it, but took notice that he was showing the machine to Mr. Shopp.

Q. 14. What did Mr. Drawbaugh say about his talking-machines to either of you?

A. He showed him a machine that he was going to invent for speaking through. He spoke something that he was inventing something to speak through wire—a box or telegraph wire at that time, or something or other at that time. Then, he didn't care about showing it to every one. He showed it to Mr. Shopp; didn't pay much attention to it myself because he was showing it to Mr. Shopp. I was more interested about my own machine. That was all that was spoke to me there at that time.

Q. 15. Did he say he didn't show it to everybody?

A. Yes, sir; he said he didn't show it to everybody, but he showed it to Mr. Shopp.

Q. 16. You were then more interested in your reaper bar more than you were in Mr. Drawbaugh's invention, were you not?

A. Yes, sir.

Q. 17. Did you after this go in company with Mr. Drawbaugh to Lancaster?

A. During that fall I went to Lancaster City with him.

Q. 18. Did you have any conversation in regard to his talking-machine then?

A. On the way coming home.

Q. 19. What did he say to you about his talking-machine?

A. Says he was working at a machine to talk to people through wire—on wire—in a box of some kind in place of telegraphing.

Q. 20. Were you looking at or talking about anything on the road that led you into this train of conversation?

A. Noticed the telegraph posts—speaking about telegraph

Q. 21. Did Mr. Drawbaugh say at what distance he could convey speech by means of his talking-machine?

A. Didn't mention just the exact distance, but it would be at a distance.

Q. 22. Do you know what business took you and Mr. Drawbaugh to Lancaster, at the time, and to what factory you were going?

PHONE COMPANY,-1

A. Getting a milling-machine up for to make this patent bar at the Lancaster File Company.

Cross-examined by Mr. Storrow:

Cross Q. 23. Where were you having the machine built?

A. Mr. Drawbaugh was to build it, and went to Lancaster to see a Lancaster party.

Cross-Q. 24. Were you and Mr. Shopp joint inventors of both of these patents?

A. Of one.

Cross-Q. 25. Which one, and who invented the other?

A. The one dated September, Shopp and myself; and the other,—then, there was three of us

Cross-Q. 26. Who were the three?

A. Mr. Delaney, of Mechanicsburg. He only got it up for us—fixed the slide and got the patent out for us. He improved the slide; that is all he had to do with it. We got it out in his name, because we already had patents on it. Mr. Stouffer, of Lancaster City, had ours in the office at the time.

Cross Q. 27. Did Mr. Stouffer make the specifications for both patents?

A. Only one. Mr. Delaney made the drawings and specifications for the other.

Cross-Q. 28. Where did you live at that time?

A. Churchtown, Cumberland county.

Cross-Q. 29. How far is that from Eberly's Mills?

A. Nine miles, as near as I can tell. I can't tell exactly.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 23d day of May, 1881.

FRED. M. OTT,
Examiner.

HENRY BONHOLTZER.

JACOB S. SHOPP, *being affirmed and examined, saith:*

Q. 1. State your age, residence, and occupation.

A. Well, I'll be forty-six on the 29th of this month; Monroe township, Cumberland county; farmer and stock-grower.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. Yes, sir; I know him about twenty years.

Q. 3. Do you recollect visiting Mr. Drawbaugh's shop with Henry Bonholtzer, to have some work done upon a reaper knife?

A. Yes, sir.

Q. 4. When was that?

A. In '69.

Q. 5. How do you fix the date?

A. It was shortly after we received a patent on a harvester knife.

Q. 6. Can you give from memory the date of your patent?

A. The 14th of September, 1869, as near as I can tell.

Q. 7. You and Mr. Bonholtzer had taken out another patent before that, had you not?

A. Yes, sir; in connection with Delaney.

Q. 8. Do you remember whether your visit to Mr. Drawbaugh's shop was before or after your second patent was taken out?

A. After the second.

Q. 9. State what took place at Mr. Drawbaugh's shop during that visit, if anything, relating to talking-machines.

A. Well, he said that he was working at a machine by which he intended to convey voice.

Q. 10. In what part of his shop did that conversation take place?

A. In his office.

Q. 11. Was Mr. Bonholtzer present at the time?

A. He was.

Q. 12. How came Mr. Drawbaugh to refer to the matter at that time?

A. Well, he just simply said that he wanted to show what he had been working at.

Q. 13. Did he show it to Mr. Bonholtzer?

A. Well, he called my attention to it; he didn't mention Bonholtzer's name in the first place.

Q. 14. How did he call your attention to it—what did he say at the time?

A. Well, he said he had a thing here which he thought, if he could succeed, would be a good thing; said he wasn't in the habit, though, of showing it to everybody.

Q. 15. Did he tell you at that time how far he could talk through the machine?

A. No, sir; not at that time.

Q. 16. Please look at the machines now shown you, marked "A," "B," "C," "D," "E," "F," and see if you recognize any of them as the machines which Mr. Drawbaugh showed you at that time.

A. Well, I saw this one [indicating "B";] I saw this glass tumbler [indicating "F";] I didn't see the others at that time, that I recollect of.

Q. 17. Did you ever see this machine "C" at any time? If so, can you tell me about when you first saw it?

A. I saw it some time in '69. I don't recollect what time I was there, though; I was there every week or two.

Q. 18. When w s the last time that you were at Mr. Drawbaugh's shop?

A. It was either '74 or '5.

Q. 19. Did you get a pump fixed at that time?

A. No, sir.

Q. 20. You have never been there since, have you?

A. No, sir.

Q. 21. Did you see any talking-machines at that time?

A. Yes, sir; I saw some models.

Q. 22. Please look at the machines before shown you, marked from "A" to "F," and state whether you recognize any of them as seen by you at Mr. Drawbaugh's shop at the time of that last visit.

A. Well, I saw those two small ones [indicating "D" and "E."] That I saw also [indicating "A."]

Q. 23. Were you at Mr. Drawbaugh's shop a number of times from the year 1869 to the last visit referred to?

A. Yes, sir.

Q. 24. State whether or not you had seen this machine "A" before the time of the last visit referred to.

A. I may have seen it before. I can't say positively.

Q. 25. In any of those visits that you have referred to, did Mr. Drawbaugh talk through the machines, or did you hear anybody talk through them?

A. No, sir; I was always too much in a hurry.

Q. 26 After the time when you saw these two machines "D" and "E" at Mr. Drawbaugh's shop, when and where did you next meet Mr. Drawbaugh?

A. It was some time in the early part of '76. I think it was in the month of February; Mechanicsburg, Cumberland county.

Q. 27. At that time at Mechanicsburg, did you have any conversation with Mr. Drawbaugh about talking-machines? If so, what was it?

A. He said, "You ought to come down now and see my arrangements I have got now." I said, "I would if I had the time." He said, "talking-machine."

Q. 28. State all of the conversation that you remember.

A. I asked him whether he was going to exhibit at the Centennial. He said, "I would, provided I can raise funds enough to do it." He says, "I haven't got the money to go ahead as I would like." That is about all the particulars.

Q. 29. How long was that conversation after you had first seen these two machines "D" and "E?"

A. Well, I saw those two models some time in 1874 or '5, and this conversation was in the early part of '76, probably about February.

Q. 30. Did a person named Weeks visit you some time last summer or fall, for the purpose of taking your affidavit about Mr. Drawbaugh's talking-machine?

A. Yes, sir.

Q. 31. Who was with him at the time?

A. Mr. Weaver—Theophilus Weaver—of Harrisburg.

Q. 32. Did they say what they wanted your affidavit for?

A. Well, I can make an explanation here. The first time that I saw them, they were at my place of residence. We had no Justice of the Peace in our place at the time. I was just about going away at the time. They insisted having my deposition that day. I told them that it would not suit me that day; that is, to go with them a distance. I was going to Mechanicsburg in a few days, and if that would suit them I would meet them there. They said that would do. They would meet me at the American House. When I came to the American House, there was nobody there but Mr. Weeks. He then took my deposition. After he had taken it, I asked him in whose interest this was taken. He replied, "Not particular in anybody's." We then went to a Notary Public and I qualified to it.

Q. 33. When Mr. Weeks took your deposition, did you tell him that Mr. Drawbaugh had shown you his talking-machines in 1869 or '70?

LEPHONE COMPANY,-1

A. I said I seen it in '70 or probably earlier than '70.

Q. 34. Why did you not fix a time for him more closely?

A. Mr. Bonholtzer had our papers for our patent on harvester cutter, and I didn't recollect the exact date of the patent.

Q. 35. When Mr. Weaver and Mr. Weeks came to your residence to get your affidavit, did either of them say that they came as friends of Mr. Drawbaugh?

A. Mr. Weaver said he always was friendly to Drawbaugh.

Q. 36. Did what he said give you to understand that their visit was of a character friendly to Drawbaugh?

A. I inferred so from what Mr. Weaver said.

Q. 37. When Mr. Drawbaugh showed you and Mr. Bonholtzer his talking-machine in 1869, did he say whether it was operated by electricity or not?

A. I don't recollect that.

Q. 38. At the time he showed you the instrument "B," was this little electro-magnet on it to your recollection?

A. There was two of those little wire coils on it.

Q. 39. When he was showing you the talking-machines at any time at his shop, did he say what he was going to do with them, or how they were going to be used in talking to a distance?

A. Well, all he said to me was, that the object was to convey voice through it.

Q. 40. Did he say anything about telegraphing in connection with remarks about the talking-machines?

A. I inferred from his conversation that it would be a substitute to be used in place of telegraphing.

Cross-examined by Mr. Storrow:

Cross-Q. 41. Have you ever made any affidavit about these machines other than the one you have told?

A. I made an affidavit in the presence of Mr. Jacobs.

Cross-Q. 42. When was that?

A. That was in the fall of 1880.

Cross-Q. 43. What time in the fall?

A. I don't recollect the exact date; it was in the fall of the year.

Cross-Q. 44. What month?

A. I think it was in October.

Cross-Q. 45. Where did you make it?

A. At my place of residence.

Cross-Q. 46. Who came there with Mr. Jacobs?

A. Mr. Drawbaugh and Mr. Bowman.

Cross-Q. 47. Did they tell you what they wanted it for?

A. They said they wanted my testimony,—it might be needed.

Cross-Q. 48. Did they tell you what it might be needed for?

A. They said that there was opposition,—I think he said, called the Bell Company. I don't recollect the exact words he used.

Cross-Q. 49. Opposition about what?

A. I asked him no questions.

Cross-Q. 50. Did he tell you where the opposition was, or that there was going to be a trial?

A. He expected there would be.

Cross-Q. 51. Did they tell you that a suit had been brought?

A. I don't recollect that they did.

Cross-Q. 52. You say you understood that Mr. Weaver was friendly to Drawbaugh; I suppose you would not have taken the trouble to go to Mechanicsburg if you had not thought he was, would you?

A. I consider that an insult. I never asked Weaver the question whether he was friendly to Drawbaugh; it was an overture of his own.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 23d day of May, 1881.
FRED. M. OTT,
Examiner.

JACOB S. SHOPP.

Adjourned for dinner until 1.30, P. M.

May 23, 1881, 1.30, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

JOSEPH MUSSER WISLER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Thirty-seven; New Cumberland; I am a heater at the steel works, in Steelton.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. Yes, sir; I have knowed him since about '61.

Q. 3. Did you build the house that you live in at New Cumberland? If so, when?

A. Yes, sir; I finished it in the spring of '77.

Q. 4. When did you commence it?

A. I commenced it about harvest, in '76, somewheres after the harvest—about August or September, I think it was.

Q. 5. What house did you live in before you finished that, and moved into it?

A. Mr. Brownwell's house at New Cumberland.

Q. 6. How long did you live in Mr. Brownwell's house altogether?

A. I lived in it about three years.

Q. 7. What time in '77 did you move into your own new house?

A. It was in the spring—latter part of March or first of April.

Q. 8. Then you lived in Mr. Brownwell's house from the spring of '74 to the spring of '77. Is that the fact?

A. Yes, sir; that is, as near as I can recollect.

Q. 9. Before you moved into Mr. Brownwell's house, where did you reside?

A. In New Market, York county.

Q. 10. How long did you live at New Market in all?

A. I lived there six years.

Q. 11. While you were living at New Market, were you ever in Mr. Drawbaugh's shop, at Eberly's Mills?

A. Yes, sir.

Q. 12. Did he show you a talking-machine?

A. Yes, sir; he did.

Q. 13. Please look at talking-machines now shown you, marked "A," "B," "D," "E," "F," and state whether you recognize among them the talking-machine, or machines, that Mr. Drawbaugh first showed you.

A. This [indicating "B"] is the first one he showed me.

Q. 14. Do you recollect whether you saw "F" at the same time?

A. Well, I might have seen it, but don't recollect of it.

Q. 15. Where were you living when you saw machine "B" for the first time?

A. In New Market.

Q. 16. Did you hear anybody talk through the talking-machine at that time?

A. No, sir; he merely explained the idea and his intentions what he expected to do with it.

Q. 17. What did he say he expected to do with it?

A. Well, he said the idea was to talk to a distance. He said that he could attach a wire to it and he could talk for ten miles. "Well," he said, "I might talk further." As far as he could have a circuit around, they would hear the same thing that he would talk into.

Q. 18. Please look at the machines "D" and "E," now shown you, and state whether you ever saw them at Mr. Drawbaugh's shop, at Eberly's Mills. If so, when did you first see them there?

A. These two machines [indicating "D" and "E"] I saw there,—the spring of 1875.

Q. 19. What did Mr. Drawbaugh say about them at that time?

A. Why, I came there and he says, "Here's something I want to show you." He said that he had just finished these [indicating "D" and "E".] He said the idea of these was to talk into one and listen at the other, at the same time. He just took them off the table in this way, [indicating,] and said you can put one to your mouth and talk, and the other to your ear and listen.

Q. 20. Please look at the instrument marked "A," and state whether you ever saw that at Mr. Drawbaugh's shop. If so, when first?

A. Well, I seen this one previous to the time I saw those others [indicating "D" and "E";] it might have been a year,—I am not positive how long, but I remember seeing this before the others.

Q. 21. Were you in Mr. Drawbaugh's shop in September, '76?

A. Yes, sir; I was.

Q. 22. What did you go there for, then?

A. I went there to get a pump fixed—the pipe of a pump.

Q. 23. Did you stop long at that time?

A. No, sir.

Q. 24. Did you see any talking-machines at that time?

A. No, sir; I did not.

Q. 25. How long were you there, then?

A. Well, I might have perhaps been there twenty minutes. I had borrowed a team, and I just went up there and got my pump, and had to return it, so I didn't stay long.

Q. 26. What did Drawbaugh do with the pump pipe?

A. Well, the pump was for a driven well pump, and he cut the thread on.

Q. 27. From the time that you were there about that pump, and down to the first of January, 1880, do you remember of being at Drawbaugh's shop at any time?

A. Well, I might have been there; I don't recollect. It's probable I was there; I used to visit there a good bit.

Q. 28. What was your employment from September, '76, to January 1, 1880?

A. I was working at the steel works, down at Steelton.

Q. 29. Did you ever see anybody talk through any of these machines at any time you went to Mr. Drawbaugh's shop?

A. No, sir; not more than he talked to me and showed me about the machines, as I have testified already.

Cross-examined by Mr. Storrow:

Cross-Q. 30. Who was present at any of these occasions, in Drawbaugh's shop, as you have testified?

A. No person, the last time that I have testified about.

Cross-Q. 31. Who was with you or who was present on any of the other occasions which you have testified about?

A. Harman K. Drawbaugh was there one time that I was there.

Cross-Q. 32. Do you remember anybody else?

A. No one else, except Daniel, of course.

Cross-Q. 33. When did you last see these instruments, before this week?

A. In 1875, I saw "D" and "E" last; I saw "A" previous to the others. I have not seen "B" and "F" since the first time I saw them.

Cross-Q. 34. How many times have you seen any of them this week before this afternoon?

A. I have not seen any of them this week, except to-day when I came to town here.

Cross-Q. 35 Were you summoned to come here by an officer, and, if so, when, and by whom?

A. I was summoned by Mr. Shank, on last Thursday evening.

Cross-Q. 36. And to-day is Monday, is it not?

A. Yes, sir.

Re-direct by Mr. Hill:

Q. Q. 37. Did Mr. Shank tell you to be here on Monday morning?

A. He first told me to be here on Friday. I said it did not suit me, that it would suit me better on Monday.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 23d of May, 1881.

FRED. M. OTT,
Examiner.

J. M. WISLER.

Adjourned until May 24, ten o'clock, A. M.

Tuesday, May 24, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, same counsel as yesterday.

HENRY F. DRAWBAUGH, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am fifty-one, or near it; reside at Newville, Cumberland county, Pa.; am superintendent of lumber mills.

Q. 2. Are you a brother of Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.?

A. I am.

Q. 3. How long have you resided at Newville?

A. I lived in Newville, and then went to Perry county, and then went back to Newville in 1873, and have lived there ever since. I went to Perry county to build a distillery.

Q. 4. What business were you engaged in in the summer and fall of 1872?

A. Distilling in the fall,—from the last of August on until about the first of December.

Q. 5. Did you have occasion to have any work done that year by your brother at Eberly's Mills? If so, what and when?

A. Yes, sir; I got an apple cylinder and hoisting rigging made in the last of July and first of August, 1872. I was there about two weeks, waiting and helping him.

EPHONE COMPANY,-1

Q. 6. Have you an entry of that transaction in any books on which it was entered at that time?

A. Yes, sir.

Q. 7. Please produce the book, and point out the entry to the examiner in order that he may copy it on to the record.

A. Here it is, and this is the entry:

"Repairs before starting to make Apple Jack 1872.
Expenses getting Sillender and hoist rigging at Eberly's Mills and passage there to - - - - - - - - - - 14.20
home. fixing up before starting, three weeks @ - - - - 25.00"

(Witness continues.) The date in 1872 is fixed by this other book, which is the day-book of the distillery, and which shows that the distillery started up on the 28th day of August, 1872. This last book shows that I paid my brother on the 9th day of November, 1872, for the work he had done in the summer of that year.

Q. 8. The charge "fixing up before starting, three weeks @ 25.00," was not a part of the work done at your brother's shop, was it?

A. No, that was another matter.

Q. 9. When you were there at your brother's shop in July or August, 1872, did he show you any talking-machines?

A. He did.

Q. 10. Please look at the machines now shown you, marked "B" and "F," and state whether you ever saw them before; and, if so, when and where you first saw them.

A. I seen them at my brother's shop at the time we was making that cylinder and hoist rigging, in 1872.

Q. 11. What was he doing with them at that time?

A. He was working at them and experimenting.

Q. 12. Do you recollect why it took two weeks for you to get your work done there at the shop at that time? If so, state.

A. He was turning up some walnut machinery for his talking-machine, different from these ["F" and "B"]; and I could not keep him at my work.

Q. 13. Did he and you talk through the talking-machines at that time?

A. Yes, sir.

Q. 14. Could you hear and understand what he said to you through the machines at that time?

A. Yes, sir.

Q. 15. Do you recollect any words that were spoken through the talking-machines ["B" and "F"] at that time—that you heard by means of them?

A. Yes, sir; "Harrisburg is the capital of the State, situated on the banks of the Susquehanna river."

Q. 16. Where were the two machines "B" and "F," when he talked and you listened—in what parts of the shop?

A. Part of the time one was in the shop and one was in the office; and part of the time one was in the cellar and one was in the office.

Q. 17. What business were you engaged in, in the years 1876, 1877, and 1878?

A. I ran a private line of cars of my own to Philadelphia, Baltimore, and New York—market cars.

Q. 18. Have you your books here to show when you commenced and when you stopped running that line of cars?

A. No, sir.

Q. 19. What is your recollection as to the time when you commenced and when you stopped running that line of cars?

A. I started running in May, 1876, and run until some time in the summer of 1878.

Q. 20. Do you recollect whether your nephew, Harman K. Drawbaugh, was employed by you on that freight train while you were running it?

A. He was.

Q. 21. At what time did your father die?

A. Eighth of December, 1878.

Q. 22. Did he die at your house at Newville?

A. Yes, sir.

Q. 23. What was his age at the time of death?

A. Near ninety-one.

Q. 24. What was his physical condition for a year or so before he died?

A. He was very bad—feeble and sick—required a great deal of attention.

Q. 25. How long did he live at your house before his death?

A. He was with me about four years before he died, except a few months that he spent with my brother John, at Eberly's Mills.

Q. 26. How far is Newville from Eberly's Mills?

A. Twenty-eight miles.

Q. 27. Why did you discontinue the freight line in the summer of 1878?

A. I could not get any one to attend to my father and had to stop and attend to him myself.

Q. 28. For some time before you discontinued the freight line, had you been obliged to neglect the freight business and attend to your father?

A. I had.

Q. 29. Between the time when you got your brother to do the work for the distillery in July or August, 1872, and the time when you started up the freight line, were you occasionally at your brother's shop at Eberly's Mills?

A. Yes, sir; quite often.

Q. 30. Did you, during that time from July or August, 1872, up to May, 1876, see your brother making any more experiments with the talking-machine? If so, how often?

A. Every time I was down he was working at it, more or less—experimenting.

Q. 31. From the time when you started up the freight line, in May, 1876, up to the time when you had to give nearly all your time and attention to your father, did you personally go with your trains, or any of them?

A. Yes, sir; myself and Harman Drawbaugh, or "Shorty," as we always call him, and my son.

Q. 32. When you were running with the trains, did you occasionally have to lay over a day, or part of a day, at Bridgeport, on the Susquehanna river, just opposite Harrisburg?

A. Nearly all the time when we came there, which was once a week, we laid over from 9 o'clock in the morning until 7 o'clock the next morning.

Q. 33. During a portion of that time when you were running with the trains, was your father with your brother John, at Eberly's Mills?

A. Yes, sir; a few months.

Q. 34. When your trains would have to lay over at Bridgeport, were you in the habit of going over to see your father and brothers at Eberly's Mills, while the train was so lying over?

A. Yes, sir; nearly every week.

Q. 35. Did you, during that time when you would go out to Eberly's Mills, on the days or nights when the train would be detained at Bridgeport, see your brother making any more experiments with the talking-machines? If so, how often?

A. As a general thing, he was working or experimenting on the talking-machine, the clock, and the motor, all three of them. He always explained them to me and showed me the improvements he was making.

Q. 36. After your father got so feeble as to require the most of your time, were you at Eberly's Mills as frequently as before, or not?

A. No, sir; not while he was so poorly.

Q. 37. How many times do you think you were at Eberly's Mills during the last six months of your father's life?

A. I don't think I was there more than twice. I was there once after some papers he had there.

Q. 38. Do you recollect being there at Daniel Drawbaugh's shop while the electric clock company were operating there?

A. Yes, sir; very frequently.

Q. 39. Was your brother doing anything with his talking-machines at that time, while the electric clock company were operating there?

A. While they were operating there, Grissinger and Dan went to Philadelphia to get some material for the clock company, and Dan wanted to get some materials for his talking-machines at the same time. Dan went with me in my car; Grissinger missed the car and went alone.

Q. 40. While the clock company were operating there at the shop, did you ever see Dan doing anything with the talking-machines at the shop? If so, how often?

A. I don't know whether I can tell you how often. Nearly every time I was down, he would be working at them,—generally at night, when no one was there but myself. He would be showing them to me and explaining them to me. When he would be working at them in day-time, and anybody would come in, he would shove them away quick, so they could not see what he was doing.

Q. 41. From the summer of 1872, down to the year 1879 or 1880, so far as you had opportunity for observation, was your brother continuously studying and working at the talking-machine, or not?

[*Objected to as leading.*]

A. Yes, sir; every time I was down there he was working at it and talking; and wanted me to go in with him and furnish means.

Q. 42. When did he first ask you to go in with him and furnish means for this invention?

A. In 1872, while I got that distillery work done.

Q. 43. And do you mean that he continued to urge you to do so down to 1879 or 1880?

[*Objected to as leading.*]

A. Yes, sir; 'till about 1879. I don't think he said anything in 1880; but he wanted me to lend him money. He asked me to lend him money to buy materials and things for it. I said I would not, but would lend him money to support his family, as he was very poor. This last conversation about lending money was in the fall of 1879. The fall of 1879 was the last time he asked me to go in with him on this invention. I did lend him money afterwards for the support of his family.

Q. 44. Did you give him articles for the support of his family at any time prior to 1879? If so, when and what?

A. I furnished him about seven hundred weight of pork about four years ago. He had not any money to buy it and was poor.

Q. 45. Why did not you go in with him on the talking-machine invention at any time during or after the summer of 1872, when he urged you to do so?

A. I was fearful there was no money in it—get my money out and would not get it back. My brother John said, "Don't encourage him or he will go crazy; he is half crazy now with studying." He was afraid he would lose his mind.

Q. 46. Did you ever hear your brother Daniel's wife talk about his spending his time experimenting? If so, how often, and during what years?

A. I have heard her make mention of it very often during the year 1876 and from that up, not from that back. She said she wanted him to stop his fooling and go off. He had good offers to superintend for other firms and then they would try and live better. They had been living so poor for many years on account of his experimenting.

Q. 47. Did she talk pretty strongly on the subject or not?

A. She did; very.

Q. 48. State whether or not Dan's experiments on the talking-machine subjected him to a great deal of ridicule from others.

[*Objected to as leading.*]

A. Yes; both that and the clock. They claimed he was going crazy. He said, if they was not so ignorant, they could see into it more—they would not think he was crazy.

Q. 49. Is he a man pretty sensitive to ridicule or not?

A. Very.

Q. 50. What effect did the ridicule to which he was subjected have upon him, so far as you know?

A. He would try to hide it from them—from all; really, unless there was some particular ones called in that would not laugh at him, then he would show it to them; but if anybody came in and said, "Oh, Dan, that is a humbug," that man never got to see any more of that thing.

Q. 51. What was your brother's financial condition from 1872 down to 1880?

A. He was poor. The greater part of the time his family was in need of money to buy household provisions; he had a large family. Part of the time he would have a little money and part of the time he was hard up. He would get some some day and use it up for his family, and then he would be always experimenting and not getting any in. At one time he sold a part interest in the clock, and got in some money, but it did not reach to square his debts; it took it all to square up, so that they were just as poor as ever.

Q. 52. State whether or not, during the last ten or twelve years, he has had a good deal of sickness in his family.

A. Yes, sir; scarcely ever without sickness—that family. He buried two children, I think, in one day, or near; and for a long time he had a daughter laying a living skeleton. I never heard of any person so light as she was. He had another daughter who might be called an invalid, as she was subject to spasms. She told me that they had been getting her a great deal of medicine from New York, and that it was doing her a great deal of good, and it was very expensive, and she wanted some more, but they had not the money to get it. Dan told me this, too.

Q. 53. That last mentioned daughter is now a young lady, is she not?

A. Yes, sir; I suppose she is twenty-one or twenty-two years of age.

Q. 54. Is she still subject to epilepsy?

A. Yes, sir; and her mind is disturbed.

Q. 55. How long has she been subject to this disease?

A. I can't tell exactly; I think the first they noticed it on her, was about the time of puberty.

Recess for dinner until 2 o'clock, P. M.

Examination resumed, pursuant to adjournment, at 2 P. M.

Suspended, by consent, to take the deposition of Peter Z. Zimmerman.

Q. 56. You have stated that your brother Daniel endeavored for a good many years to get you to go into the talking-machine with him. Do you know whether he tried to get others to go in with him, besides you?

A. He told me that he had asked a great many to go in with him. I was not with him when he asked them, but he got me to see others for him, and I have seen different parties for him.

Q. 57. Some time between 1867 and 1870, after your brother Daniel sold out an interest in the faucet patent to the faucet company, known as the Drawbaugh Manufacturing Company, did he and you buy a homestead for your aged father and mother?

A. Yes; we bought it in the fall of 1868.

Q. 58. How much money did he contribute towards the purchase of that homestead?

A. One thousand dollars.

Q. 59. And how much did you contribute?

A. About twenty-seven hundred.

Q. 60. When did your mother die?

A. She died in the fall of 1869.

Q. 61. After your father got through with that estate, was there anything left of it to divide among his heirs?

A. Owing to the depreciations in the value of property, and some money that my brother-in-law was to have put in and did not, he pleading the statute of limitations after my sister's death, and debts having accrued, the whole estate was exhausted, so that I had to bury my father myself; I never got a cent out of the property. I have had to pay some of the debts over and above what the property brought. After my father's death I had to get the grave-stones, and my brother Daniel promised that, whenever he was able, he would give me fifty dollars towards it, but he never has yet, because he has not been able.

Q. 62. Did your brother Daniel contribute anything to your father's funeral expenses, and if not, why not?

A. No, he did not. He said he did not have anything, but he said that if ever he was able he was going to repay me for what I did for our parents.

Q. 63. Was Daniel in the habit of showing his talking-machines much to his brother John, and if not, why not?

A. He did not show it much to John, because John was always jawing him for working at something like that, and for not working at something that would pay him regular wages. He said he needed it for his family, and here he was working and always experimenting at something that did not pay him, or something like that; that he would go crazy with it after a while, and Dan did not like to show it to him.

Q. 64. Were you ever in the shop with Dan when he was working with the talking-machines, and when he would hear somebody coming into the shop that he thought might be his brother John? If so, what have you observed him do on such occasions?

A. When he was working in the shop there at the telephone, or talking-machine—we had no other name for it then—and we would hear any one coming, he would bustle and hide it away; and several times, as I was there, I looked out of the window and seen it was John, and I said it was only John; he put it away all the quicker. He said: "John is always finding fault."

Q. 65 Why was he willing to show it to you more than to John?

A. There were two reasons for that. One was that he wanted me to furnish the money; the other reason is, that I would not discourage him, but would assist him, when no one was there, to experiment on it, and say nothing about it to any one.

Q. 66. After you saw the original machines in the summer of 1872. did you afterwards, from time to time, as you would be at the shop, down to the year 1880, see him working on any other talking machines?

A. Yes, sir; quite a lot of other machines that he was working at different times—different parts—it was intended for the same machine, I suppose.

Q. 67. Are you able to fix the dates of any other machines that you saw after the first ones?

A. Nearly every time I came to the shop from that up, he had some of his machines there. I saw he was experimenting. I often stayed there in the evenings with him or with my brother John. After supper in the evening, he would generally say, "Now, Harry, come along down to the shop, I want to experiment." We would go down to the shop, and lock the shop, and we would often stay there 'till midnight. Then he would adjust it and attach it to the wires, and then he would have me running down into the cellar, back and forth, listening

PHONE COMPANY,-1

and talking into it, until I got that tired that I thought I could not stand it, but I did not want to discourage him.

Q. 68. When you would be with him so late at night, while he was experimenting on the talking-machines, and while he was working at the machine and getting ready for some experiments, did you always keep awake yourself?

A. No; he had a large drafting board in the shop on trestles, and I would lie down on that and take a nap, and when he wanted me he would wake me up.

Q. 69. Do you remember others being in the shop in the evening?

A. No, sir; he would not have no one else in, at least when I was there. I don't know what he did when I was not there. When I was there, he did not want to be bothered, and did not want anybody to know anything about it.

Q. 70. Did you ever know him, when anybody was there after supper time, to shut up the shop and go away in order to get clear of them, and then afterwards return and spend the evening at his experimental work?

A. Yes. On several occasions, when parties were in there sitting around, and would not go away, he would say, "Well, I believe I will go home." He would go up to the house 'till they would get out of sight, then we would go back to the shop. He fooled Cal. Row away that way one night, and the miller at the lower mill—I don't know what his name was. The miller came in there to talk about a water-wheel.

Adjourned until May 25, 1881, at 10 o'clock, A. M.

May 25, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Smith and Mr. Storrow for complainants, and Mr. Hill, Mr. Jacobs, and Mr. Abraham for respondents.

[*Examination of Henry Drawbaugh continued.*]

Q. 71. Please look at machines now shown you, marked "A," "C," "D," "E," "G," "H," "I," "J," "K," "L," "M," "N," "O," and see if you recognize any of them as machines which you have seen at your brother's shop heretofore. If so, please point out the particular machines which you are now able to identify positively.

A. "C" is one, and "I" is another. I seen those before I saw this ["A."] This machine "A," I recollect, came after "C" and "I." I saw all those three and "D," before I commenced running the cars. While running the cars and from that up, I was in the shop a great deal. These, [indicating "E," "G," "K," "L," "M," "N," "O,"] all look to me about alike. I can't tell tother from which. I identify this machine "A" by the mouth-piece on one side of the center, and this machine "D," by the curled magnet on the back of it. I identify the machine "H," also. I remember seeing him working at it in the shop. I was helping him on that machine, I remember. I don't remember anything about "J." I have seen all the others, "E," "G," "H," "L," "M," "N," "O," and helped him operate them, while I was running the cars and later. I remember talking through them and listening at them, but I can't tell which first, and which last. I can't remember the order in which they came along. I remember another machine, which I do not see here; that was among the first that he was working at. It was a shoe-blacking box, or of that order. It looked to me like a large shoe-blacking box. It had a drop of solder inside, and a point on a spring, and some fixings inside, and some wires. He was working at it and adjusting it; that was in 1872. Then he told me he was going to make a machine to talk instead of using the signal key to telegraph; that was among the first things he told me about it. I then asked him how far he could talk with it. "Oh," he said, "across the continent."

Q. 72. How many of these machines that have been shown you, and that you recollect seeing there at the shop from time to time, did you ever talk through, or hear anybody talk through, at the shop, from 1872 down to 1880?

A. I never seen anybody talking through them, but Dan and myself. He never would do anything with them, when anybody else was in the shop, when I was there, except that his little boy would be there sometimes. I guess we talked through pretty near all of them. I can't tell those machines, "E," "G," "K," "L," "M," "N," "O," apart. He was working at them, and we talked through them, nearly every time I was there, but I can't tell them apart.

Q. 73. To the best of your recollection, about what time did you first see this machine "H," with the bell on top?

A. I seen that while I was running the cars. My impression is that it was the first year; it may have been the latter part of the year.

Q. 74. Did you ever talk through it, or hear him talk through it?

A. He was experimenting a good deal on that. He was using that machine—was experimenting and trying it. He had a wire through into the office.

Q. 75. To the best of your recollection, about what time was it that you first saw this machine "A"?

A. Shortly after the time that I got that apple arrangement, or cylinder made; it might have been the next summer.

Q. 76. I understand you that you saw these two, "C" and "I," before you first saw the machine "A"; am I correct or not?

A. I seen "C" and "I," shortly after I got the apple cylinder made;—before I saw "A"; that is my recollection.

Q. 77. What is your best recollection as to the time when you first saw this machine "D"?

A. My impression is that I seen it before I started running the cars; I could not tell what year. I recollect it by that curve.

Q. 78. Did you and Harmon Drawbaugh conduct the same trains, or different trains, while he was in your employ?

A. The cars all run together to Reading. From there he would go to New York by way of Allentown, and I would go to Philadelphia.

Q. 79. Do you recollect talking through or listening to this machine "D" before you ran the cars?

A. Yes, sir; I think it was the summer before.

Q. 80. When you were experimenting with your brother Dan, during the time that you were running the cars, or before, did you use one instrument to talk into and another to listen at, or did you use the same instrument to talk into and to listen at, or did you use the instruments in both the ways that I have mentioned? State your recollection upon the whole matter referred to in this question.

A. When I helped him, there was always one at each end of the wire. When he was working at night, he always had the wire long enough, so that he could have it at the work-bench, and work, and file, and adjust it without disconnecting the wire. (Question explained to witness and explanation illustrated by machine "D." Witness continues.) We talked and listened in the same one. If we were using this one, "D," we would talk into it and then put it to the ear to receive the answer. I think we used "B" and "F" the same way, but I won't be positive about it, because it was so long ago. I know that we used "D" that way.

Cross-examined by Mr. Storrow:

Cross-Q. 81. Did you ever talk through "I" and "C?"

A. That is my impression, sir—yes, sir.

Cross-Q. 82. Were those two used together—one to be talked into and the other listened at?

A. I think so.

Cross-Q. 83. Which of them was talked into, and which one was listened at, if you remember?

A. It is so long ago. I recollect that we used them, but I can't tell how we used them—which way, or whether we used these two together.

Cross-Q. 84. Are they in the same condition now that they were when you used them?

A. Well, I did not look into them then. There was a wire attached, and [taking "I" in his hand and touching the mouth-piece] I think there was something in this hole. I don't know whether "C" is in the same condition now that it was then or not. I think there was something inside of it, too. When he was working at it, Dan would be taking them apart and putting them together every few minutes, until I was so tired that I was glad to have it over. I only did it to accommodate him, not because I wanted to.

Cross-Q. 85. I suppose that, in all the experiments with all the instruments, he was doing just that way--taking them apart and fixing them, and making you wait while he did it, and then making you try them again with him, was not he?

A. A great portion of the time. Then, sometimes, he would say, "Do you hear it plainer now?" and sometimes I would hear it plainer, and sometimes I would hear no sound at all. I was getting tired of it.

Cross-Q. 86. Did you ever have any talk with him about going in with him on any other of his inventions, or about manufacturing any other things that he had invented?

A. Yes, sir.

Cross-Q. 87. What was it?

A. The faucet; also the clock.

Cross-Q. 88. When did you have any talk with him about going into the faucet business with him?

A. That was the summer before father died; in fact, the two years before he died.

Cross-Q. 89. Did you make any plans about going into the faucet business with him, or make any arrangements with reference to it?

A. Yes, sir; I did. I made some plans, but they were not carried out.

Cross-Q. 90. What were your plans, and why were they not carried out?

A. There had been a bark-mill owned by Dr. Ahl, and it was turned into a splint factory. I wanted to buy it for to make it into a machine-shop. I wanted to buy it, and waited for about six months for a decision, whether I could get it or not. I only found out a few weeks before father died that I could not get it. "Shorty" was waiting about six months, or in that neighborhood. He was to be foreman of the shop. He was working part of the time in the telegraph office, but he did not like it, and then he started down to Houck's.

Cross-Q. 91. If you could have got that mill when you first tried for it, were you going to give up your freight line?

A. Yes, sir; I had given up the freight line a short time before that, on account of father.

Cross-Q. 92. Did your brother ever get anybody to go into the faucet business with him, on that faucet that you and he talked about?

A. I don't know whether he did or not. I think—at least they manufacture them—Chellis and him. I don't know whether he went in with him on the patent or not. Chellis and he are manufacturing them, any way.

Cross-Q. 93. When did Chellis go in with him?

A. Two years ago, I think. That was when they commenced manufacturing them.

Cross-Q. 94. When was it that your brother first asked you to go in with him on the clock?

A. That was the summer before Shettle and Grissingers' went into it.

Cross-Q. 95. Do you remember what year it was that he asked you?

A. I guess it was in 1875 or 1876; he asked me different times. He waited quite a while on me. I only gave him my decision about a week before Shettle went into it.

Cross-Q. 96. Is the instrument "D" in the same condition now that it was in along about the time that you first used it?

A. No, I think it had a kind of wooden bottom on it. I don't recollect how the wire was attached—it had a wire on somewhere, and a bottom on it.

Cross-Q. 97. Are you a mechanic? Do you understand the business of a mechanic?

A. Some branches, I do; yes, sir.

Cross-Q. 98. How much were you at your brother's shop before the summer of 1872—say from 1865 up to 1872?

A. I was there occasionally—not very much.

Cross-Q. 99. What made you go there in 1872 more than before?

A. I was getting work done in 1872.

Cross-Q. 100. Were you ever in the distilling business, except distilling apples in Perry county, as you have testified?

A. No, sir.

Cross-Q. 101. How long were you in that business in Perry county—from what year to what year?

A. I run about three months in the fall of 1869, and about three months in the fall of 1872. I commenced on the 28th of August and run 'till the apple season was over.

Cross-Q. 102. Did you ever hear of anybody, besides your brother, having made telephones that would talk?

A. I did not know what a telephone was until once I was in the shop. He then told me there was a man called Edison, who lived in New Jersey, at a place called Glenlo Park—at least that is the way that I remember the name—that had made a talking-machine, and that it was his invention, and he was going down to see him about it. He said it was called a "telephorn;" that was the meaning of it, but I don't give it the right pronunciation. He says then: "If you had give me the money, or helped me, or got somebody to go in with me, that man would not have got my invention." I then told him I would do as I had done before—that I would give him money if his family was in need, as I had done before, and would do again, but that I had worked hard for my money, and did not propose to put it into anything that I did not see the dollars and cents in.

Cross-Q. 103. When was it that he told you this about Edison?

A. This was about—well, it was while father was in my house. I guess it was in 1877 or 1878, along there.

Cross-Q. 104. Was it while you were running your cars?

A. I rather think it was during the latter part of the time I was running the cars.

Cross-Q. 105. Did he tell you how he had found out that Edison had a telephone?

A. He did not tell me. He said he had one; but I don't know that he told me how he had found it out.

Cross-Q. 106. Did he show you anything in a newspaper or book about it?

A. I don't think he did; I think he just told me.

Cross-Q. 107. Did he afterwards go and see Edison about it?

A. I don't know whether he did or not.

Cross-Q. 108. Did you ever have any more talks with him about Edison's telephone?

A. I may have; I don't recollect of anything.

Cross-Q. 109. Did you ever have any talk with him about any other person's telephone?

A. No, sir; I think not. I don't know that there is any.

Re-direct by Mr. Hill:

Q. Q. 110. Why were you more willing to go in with him on the faucet than on the clock or telephone?

A. As regards the faucet, I knew more about that. They had a faucet there, and I knew that the demand was great—that they sold high, and this faucet could be made for less money. It was a simpler faucet, and I knew that there could be a great many sold. There was money in it; that I could see. The old faucet was the one the old company sold to Hauck. Now, he kept at me quite a while about the clock. I knew that the clocks were good, because he had one running in the shop for a long time—for years—a little round thing. I thought I would go in with him and pay for the patent, and get a good clock for it, anyhow. When he told me that he thought he could get a thousand dollars for it from Mr. Shettle and others, I told him to let them have it quick. I wanted him to get the money to pay his debts.

Q. Q. 111. Did not you think there was any money in a machine by which one man could talk to another a long distance away?

A. No, sir; I did not think there was anything in that. I talked to an operator, and this is what he said: "It will never do. Telegraphing and this kind of news are strictly private. Everybody could take it off around at different points. There will never be a thing like that introduced. It won't be no good."

A. No, I think it had a kind of wooden bottom on it. I don't recollect how the wire was attached—it had a wire on somewhere, and a bottom on it.

Cross-Q. 97. Are you a mechanic? Do you understand the business of a mechanic?

A. Some branches, I do; yes, sir.

Cross-Q. 98. How much were you at your brother's shop before the summer of 1872—say from 1865 up to 1872?

A. I was there occasionally—not very much.

Cross-Q. 99. What made you go there in 1872 more than before?

A. I was getting work done in 1872.

Cross-Q. 100. Were you ever in the distilling business, except distilling apples in Perry county, as you have testified?

A. No, sir.

Cross-Q. 101. How long were you in that business in Perry county—from what year to what year?

A. I run about three months in the fall of 1869, and about three months in the fall of 1872. I commenced on the 28th of August and run 'till the apple season was over.

Cross-Q. 102. Did you ever hear of anybody, besides your brother, having made telephones that would talk?

A. I did not know what a telephone was until once I was in the shop. He then told me there was a man called Edison, who lived in New Jersey, at a place called Glenlo Park—at least that is the way that I remember the name—that had made a talking-machine, and that it was his invention, and he was going down to see him about it. He said it was called a "telephorn;" that was the meaning of it, but I don't give it the right pronunciation. He says then: "If you had give me the money, or helped me, or got somebody to go in with me, that man would not have got my invention." I then told him I would do as I had done before—that I would give him money if his family was in need, as I had done before, and would do again, but that I had worked hard for my money, and did not propose to put it into anything that I did not see the dollars and cents in.

Cross-Q. 103. When was it that he told you this about Edison?

A. This was about—well, it was while father was in my house. I guess it was in 1877 or 1878, along there.

Cross-Q. 104. Was it while you were running your cars?

A. I rather think it was during the latter part of the time I was running the cars.

Cross-Q. 105. Did he tell you how he had found out that Edison had a telephone?

A. He did not tell me. He said he had one; but I don't know that he told me how he had found it out.

Cross-Q. 106. Did he show you anything in a newspaper or book about it?

A. I don't think he did; I think he just told me.

Cross-Q. 107. Did he afterwards go and see Edison about it?

A. I don't know whether he did or not.

Cross-Q. 108. Did you ever have any more talks with him about Edison's telephone?

A. I may have; I don't recollect of anything.

Cross-Q. 109. Did you ever have any talk with him about any other person's telephone?

A. No, sir; I think not. I don't know that there is any.

Re-direct by Mr. Hill:

Q. Q. 110. Why were you more willing to go in with him on the faucet than on the clock or telephone?

A. As regards the faucet, I knew more about that. They had a faucet there, and I knew that the demand was great—that they sold high, and this faucet could be made for less money. It was a simpler faucet, and I knew that there could be a great many sold. There was money in it; that I could see. The old faucet was the one the old company sold to Hauck. Now, he kept at me quite a while about the clock. I knew that the clocks were good, because he had one running in the shop for a long time—for years—a little round thing. I thought I would go in with him and pay for the patent, and get a good clock for it, anyhow. When he told me that he thought he could get a thousand dollars for it from Mr. Shettle and others, I told him to let them have it quick. I wanted him to get the money to pay his debts.

Q. Q. 111. Did not you think there was any money in a machine by which one man could talk to another a long distance away?

A. No, sir; I did not think there was anything in that. I talked to an operator, and this is what he said: "It will never do. Telegraphing and this kind of news are strictly private. Everybody could take it off around at different points. There will never be a thing like that introduced. It won't be no good."

Q. Q. 112. Did your brother Dan at one time offer to make you a present of the faucet invention?

A. Yes, sir.

Q. Q. 113. Why did he do that?

A. Because I had taken care of my parents. He said he would give me that as his proportion as an equivalent, as he had not the money to give me.

Q. Q. 114. Did he say that before you endeavored to get the bark-mill for the purpose of manufacturing the faucet?

A. Yes; a couple of years before that.

Re-cross by Mr. Storrow:

Re-cross-Q. 115. Was not your brother's proposition to you about the faucet, that he would prepare the specifications, drawings, and models; that you should pay the cost of getting the patent and start the manufacture, and that both of you should have an interest in the patent?

A. Not on the faucet, but on the clock.

Re-cross-Q. 116. You mean that was the proposition on the clock?

A. He proposed that he would get up specifications and drawings; would have it patented, and he would go in partners; I would pay the expense. That was on the clock, but the faucet he would give to me for what I said before. At one time, it was spoken of that we should go in on both patents, the faucet and clock, but in the end he said that he would give me the faucet, as I have stated before.

Re-cross-Q. 117. Look at the machinery on the inside of the cover of "H;" there are there two brass springs over the center, and one blue steel spring off at the side. Were all these three springs on it when you first saw it?

A. I can't tell whether three springs were on it or not. At the time he was working at the machine he was adjusting it, and putting it together and experimenting. I know there was one spring he was working at that was to be so easily moved that he said you could scarcely tell how light it should be made. This is the one, I think, [indicating the outermost brass spring,] he was working at. He was putting plumbago in at the time, and I did not know what plumbago was, and I don't know yet. He was explaining it to me; I did not understand, but I only remember the name. I just looked at it when he was working at it, and I can't say whether it had three springs or not.

Re cross-Q. 118. When did you have the talk with the telegraph operator that you have spoken of?

A. I think it was about six years ago. The reason is that in 1875 I was not in any business at all and I think that was the time.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to, this 25th of May, 1881.
FRED. M. OTT,
Examiner.

HENRY F. DRAWBAUGH.

Recess for dinner until 2.30, P. M.

May 25, 1881, 2.30, P. M.

Examination resumed.

Present, same counsel.

HENRY F. DRAWBAUGH *recalled.*

Examined by Mr. Hill:

Q. 1. You have referred in your deposition this forenoon to a conversation with your brother Daniel about Mr. Edison's inventing a telephone. You have also referred to a conversation with your brother Daniel about the adjustment of the springs, and the use of plumbago, in the machine "H." Which of those two conversations occurred first?

A. Is the machine "H" that long one with the bell on? I want to know that. [Examiner informs witness that it is. Witness then continues his answer.] The conversation regarding the use of plumbago in that machine was before I knew anything about Edison having a talking-machine.

Q. 2. What is your best recollection as to how long before?

A. While I was running the cars yet, Dan wanted me to bring some chemicals with me from Philadelphia,—plumbago among the rest, for that purpose; and as he did not give me the money, I did not bring them, and I did not know anything about Edison until after I quit running the cars, or about the last of my running.

Q. 3. That does not quite answer my question. What I want to get at is this: how long the conversation with Dan about adjusting the spring, and about using plumbago in the machine "H," with the bell on it, was before the talk about Edison?

A. It was while Dan lived at Mechanicsburg that Dan came to my car at Mechanicsburg and wanted me to bring it with me. That was the first time I ever heard the name plumbago. On my return I found him working with some in his shop, and I suppose he got it at Harrisburg.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 24th day of May, 1881.

FRED. M. OTT,
Examiner.

HENRY F. DRAWBAUGH.

PETER C. ZIMMERMAN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, going on fifty-six; residence, Shiremanstown, Cumberland county; occupation, wheelwright.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him for forty-five years, at least. We were schoolmates together.

Q. 3. How long have you lived at Shiremanstown, where you now live?

A. Ten years last April; since April, 1871.

Q. 4. Do you recollect being at Mr. Daniel Drawbaugh's shop, at Eberly's Mills, before you moved to Shiremanstown?

A. Yes, sir.

Q. 5. Did he ever show you any talking-machines there, before you moved to Shiremanstown?

A. Yes, sir.

Q. 6. How long before you moved to Shiremanstown?

A. Some time in February or March, 1871. I could not identify the month, except that it was one of those named. It was just a little while before I moved.

Q. 7. Describe the talking-machines that he showed you.

A. There were two spools like; two coils of wire rolled up together, on a little piece of board, and a copper wire attached to it, and under the end of it there was a little tin spring. There was a little box like a coffee essence box, with little drum-heads in it like—something like a drum-head. I think it had heads at both ends. I saw something like a cup, and a broken tumbler like, and these were lined inside with plaster-of-Paris.

Q. 8. After you saw those machines in Drawbaugh's shop in 1871, when did you see them again?

A. I saw them again when I saw Mr. Drawbaugh and Mr. Jacobs have them. I never saw them again 'till then. I then identified them, before ever I saw the machines.

Q. 9. Did Mr. Drawbaugh, or Mr. Jacobs, come to your house, or shop, at the second time that you saw them, as you have testified?

A. Yes, sir; to my shop.

Q. 10. You say that when Mr. Drawbaugh and Mr. Jacobs came to your shop, you identified the machines before you saw them. Explain what you mean by identifying them.

A. I mean to say that I knew it to be the self and same machine that I saw before.

Q. 11. How did you know that before you saw them?

A. Because I recollected and knew when they mentioned the talking-machine. I knew exactly what it was, and knew what I had saw, and knowed what to tell them, and it was in my mind fresh, just as though I had saw it the day before.

Q. 12. Did you describe the talking-machine to them before they had shown you the machines, or not 'till afterwards?

A. Yes, sir; before they showed it to me.

Q. 13. State whether you have ever seen those machines since the time Mr. Drawbaugh and Mr. Jacobs showed them to you at your shop.

A. No, sir; I have not saw them since.

Q. 14. Have you seen them to-day, since you came here to Harrisburg to testify?

A. No, sir; I have not saw them.

Q. 15. I will now show you two machines, marked "F" and "B," and ask you whether you ever saw them before; and if so, when and where, and are they the same machines referred to by you in your testimony?

A. Yes, sir; those are the same machines.

Q. 16. When you saw them in Mr. Drawbaugh's shop in 1871, did you hear anybody talk through them?

A. No, sir.

Q. 17. Did Mr. Drawbaugh tell you at that time that he had talked through them, and that the words talked through them could be heard and understood through the machines?

[*Objected to as incompetent.*]

A. Yes, sir.

Q. 18. Did he tell you how far anybody could talk through them so as to be heard and understood?

[*Same objection.*]

A. Yes, sir.

Q. 19. State what he said about it.

[*Same objection.*]

A. He said it could be heard hundreds of miles.

Q. 20. Did he tell you on what principle the machine operated? If so, state.

A. He said it was electricity that would pass it over the wires; that it would carry the sound right along.

Q. 21. Did he make any remark comparing it with the telegraph in any way?

A. Yes, sir; he said it would be much easier and better than the telegraph, and would supersede it.

Q. 22. Do you recollect whether anything was said about the copper wire on the spools at the time when you saw the machines in 1871? If so, what?

A. He said that the copper wire on the spools was to give a length to the wire. I asked him what the green stuff on the wire was for. He said that it was to keep one wire from another, and so that the electricity and sound would pass all over without interfering.

Q. 23. What, if anything, was said about the fineness of the copper wire?

A. I asked him where he got such fine copper wire. He said that he got fine wire and drawed it finer himself. He made it as fine as it is.

Q. 24. After you moved to Shiremanstown, did you tell anybody what you had seen at Drawbaugh's shop, and what he could do with the machine?

A. Yes, sir.

Q. 25. How long was that after you had seen the machine?

A. It might have been a month, or it might have been two. It was after I lived there a while.

Q. 26. What remarks were made about you in consequence of your telling about it and expressing your belief in it?

A. That I was crazy.

Q. 27. When did Mr. Drawbaugh and Mr. Jacobs visit you at the time you referred to?

A. Some time last winter. They were there in a sleigh.

Q. 28. Have you ever been visited by a couple of gentlemen who professed to be taking subscriptions for a book on telephones?

A. By one man, sir.

Q. 29. When was that?

A. It was this spring. There was snow on the ground, and it was sloppy weather.

Q. 30. Did he give his name?

A. No, sir.

Q. 31. What was said and done at the time when he visited you?

A. He handed me the book. I looked at it and turned the leaves over. Then he took the book and turned it over several leaves, and said, "Here is a telephone," saying, "This was Bell's invention." I said, "Ah, not so; this is Mr. Drawbaugh's invention. Some one is trying to steal his rights." Then I replied, "You had better leave; you can't make anything here." Then I stated to him, when he took the book, looking in the front of it where he took subscriptions, "Why, you have no subscribers." Then he replied, "I have a book in my pocket, where I have their names in." I told him I did not want to see his book, and advised him to leave. He left and I have not seen him since.

Q. 32. What impression did you get about him at that time, or about his business in coming to see you?

A. That he was a spy.

Cross-examined by Mr. Storrow:

Cross-Q. 33. Did you ever see anywhere else any spools of wire?

A. No, sir.

Cross-Q. 34. Where did you live before you moved to Shiremanstown?

A. At New Market, York county.

Cross-Q. 35. How long did you live there?

A. One year.

Cross-Q. 36. Did you ever go to Drawbaugh's shop, after the time you have testified about?

A. No, sir.

Cross-Q. 37. Did not you think it was a crazy thing to think of carrying sound over a wire, or any way except through the air, after the fashion of ordinary conversation?

A. No, sir.

Cross-Q. 38. It seemed to you quite natural, did it?

A. Yes, sir; the reason why, was, I knew it would pass through a piece of timber, no odds how long. I knew if you scratched at one end, you could hear it at the other end, quite distinctly.

Cross-Q. 39. Did you ever tell your neighbors that you knew that, and if so, was not that the reason they remarked that you were crazy?

A. Yes, sir.

Cross-Q. 40. Have you seen Mr. Drawbaugh or Mr. Jacobs to talk with them since the visit which you say they made to your shop?

A. I have seen them, yes, sir; several times since.

Cross-Q. 41. When and where?

A. In Shiremanstown, at my place of residence.

Re-direct by Mr. Hill:

Q. Q. 42. How happened you to see them in Shiremanstown since that first visit of theirs?

A. The reason was, my house and shop stands about a half a square from the tavern where they would stop to get their meals when they would come there. I have seen them standing on the porch, and I could also see them from my shop door. I have seen them drive by frequently when I did not speak to them. At other times, I would speak to them and bid them the time of day. The reason was that Drawbaugh and I have been intimate since we were boys. We have been like brothers.

Q. Q. 43. Have you had any talk with them about talking-machines since that first visit?

A. I have spoke to Mr. Drawbaugh about it, yes, sir; several times—talking about the machine, and about the idea of vibration, and a certain remark he made to me in conversation. The remark was this. That he heard Mr. Samuel Hertzler's daughter play on the organ probably a quarter of a mile from his place of residence. While she was playing the organ, he took notice that there was a sound of a cut-off in that organ, just like a tap, tap, tap—a cut-off in that sound. Being anxious to know what caused it, he went to Samuel Hertzler's, and found a break in the window

EPHONE COMPANY,-1

glass. Being loose, it would jar. From that, he seen what the cause was of that there sound,– cutting off like. Then, he said that that showed him that he was right; that give him an idea that he was right in his study.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 24th day of May, 1881.
FRED. M. OTT,
Examiner.

PETER C. ZIMMERMAN.

WILLIAM H. BATES, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Forty-eight; Mount Joy, Lancaster county; occupation, blacksmith.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him about thirty-five years.

Q. 3. Were you in his shop at Eberly's Mills at any time during the summer of 1874?

A. Yes, sir.

Q. 4. When was the last time that you ever were in his shop at Eberly's Mills?

A. In the fall of 1877.

Q. 5. From the summer of 1874 to the fall of 1877, how many times were you in his shop, in all?

A. I was there eight or ten times.

Q. 6. Were those visits scattered along through all the time, from the summer of 1874 to the fall of 1877?

A. Yes, sir.

Q. 7. Did you see any talking-machines there at those visits?

A. Yes, sir.

Q. 8. Did you ever talk through any of them, or hear anybody talk through them?

A. No, sir.

Q. 9. When did you first see talking-machines there at his shop?

A. In 1874, in the fall.

Q. 10. Please look at the machines now shown you, marked from "A" to "O," inclusive, except "J," and state whether you recognize any of them as having been seen by you at Drawbaugh's shop during the years referred to.

A. This machine here—these three, [indicating "B," "F," and "C,"] I saw the first time I was there; but this machine, "C," is not all here. There was something more attached to it at that time. I recognize this, ["A,"] and that, ["D,"] and that, ["E."] This one ["H,"] I recognize, too. I would not be just positive as to the date when I saw it. I saw it there.

Q. 11. When Drawbaugh first showed you these machines "B" and "F," did he tell you what they were for?

A. Yes, sir.

Q. 12. What?

A. Talking-machine—to take the place of telegraphing.

Q. 13. Did he tell you how they were operated?

A. Yes, sir; by electricity.

Q. 14. Did he tell you how far he could talk through them from one place to another?

A. Yes, sir; he said they could be used the same as a telegraph wire for a distance.

Q. 15. Did he at that time, or any other time during those years, say anything to you about patenting the invention? If so, what?

A. He told me he would get it patented if he had the means, and he had asked several men to assist him, and they just laughed at him.

Q. 16. When did he tell you that?

A. He told me that in '74,—first time that he talked to me about the talking-machine.

Q. 17. State, as near as you can, about when it was that you first saw this machine "A."

A. I saw that machine in August, '75.

Q. 18. State, as near as you can, about when you first saw these machines "D" and "E."

A. I saw them also in August, '75.

Q. 19. State, as near as you can, about when you first saw this machine "H."

A. I can't positively state just the time. It was in the summer of 1876, to the best of my recollection.

Q. 20. Did you see the inside of it?

A. Yes, sir; he also had a battery connected to it.

Cross-examined by Mr. Smith:

Cross-Q. 21. Have you told us all that Drawbaugh said to you about these talking-machines during the whole time that you have mentioned?

A. We had general conversation about it at different periods during that time.

Cross-Q. 22. Did you talk with him about the machines every time you were at the shop?

A. Yes, sir.

Cross-Q. 23. Will you state anything else that he said to you at these various times, besides what you have already stated?

A. It would be hard to tell what we talked about, every time I was there. His general conversation was about talking-machines. Several times that I was there his mind seemed to be taken up with it. He said he would like to get it patented, but he had not the means to do it. He said he could make a fortune out of it.

Cross-Q. 24. And did he tell you this a number of times?

A. Yes, sir; we were very intimate friends, and I went to see him pretty often, and we exchanged opinions about mechanism.

Cross-Q. 25. When he showed you the instrument marked "H," what did he say about it?

A. He said it was a talking-machine, worked by electricity.

Cross-Q. 26. Was that all he said about it?

A. He showed me how it worked—charged like a battery. It had a battery connected with it—charged with electricity—worked by a battery—that he could communicate sound with it, from one point to another.

Cross-Q. 27. Was that all he said about it?

A. That is about as much as I know that he said about it. It takes a good memory to connect a whole hour's conversation. It was the principal point, anyhow, that was talked of.

Cross-Q. 28. How many times did you see that instrument at his shop?

A. I may have saw it three or four times. I was there about that many times from the fall of 1876 to the fall of 1877.

Cross-Q. 29. What did he say to you about that instrument or about any of the other instruments, at any of those three or four interviews after the fall of 1876?

A. He told me it would take the place of telegraphing, and remark-

AMERICAN BELL TELEP

ed that if he had money enough to get it patented, he would be well fixed.

Cross-Q. 30. What did you say to him when he told you that?

A. I told him it was a grand pity he had not the money to get it patented.

Cross-Q. 31. When he first showed you the instruments "A," "D," and "E," what did he say to you about them, or either of them?

A. He told me he thought he had the talking-machine completed.

Cross-Q. 32. Was that all that he told you at that time?

A. That is about the sum and substance of it.

Cross-Q. 33. Did he say anything then about getting it patented?

A. I think the first time we ever spoke together about the talking-machine, he wished he had money enough to take out a *caveat* for a patent. I think that was when I first saw that machine, [indicating "C,"] when he first commenced to work on it. When he showed me the machines "A," "D," and "E," he said he thought he had the talking-machine perfected. That was after he showed me the machines "B," "F," and "C."

Cross-Q. 34. At the time when he showed you the machines "A," "D," and "E," did he say anything about getting them patented?

A. Yes, sir; he said he would get them patented if he had money enough to do it, but he had not the money. I knowed he was very poor at that time, too.

Cross-Q. 35. How many times did you see the machines "A," "D," and "E" at his shop after the first time?

A. I may have probably seen them a half a dozen times.

Cross-Q. 36. After you first saw these machines in August, 1875, how many times were you at Drawbaugh's shop before the fall of 1876, when you first saw the machine "H?"

A. That I could not tell you exactly how many times. I went there very frequently.

Cross-Q. 37. Did you see the machines "A," and "D," and "E" at each of the times when you went to the shop in the fall of 1875, and in the winter, spring, and summer of 1876?

A. That I could not say positive. I know I was there some times that I was not upstairs where the machine was; that I had not the time. He had this talking-machine upstairs in a private office room that he had there, and very often I did not go in there.

Cross-Q. 38. Did you during that time, between the summer of 1875 and the fall of 1876, see these talking-machines a number of times?

A. I was there in August, 1875, and I know I was there in the winter for a certainty, because I had business there.

Cross-Q. 39. Did you see these machines during that time, after the first time that you saw them?

A. Yes, sir.

Cross-Q. 40. How many times?

A. That I would not be positive in telling. I could not say how many times.

Cross-Q. 41. Did you, at any of your interviews with him, after you first saw the machines "A," "D," and "E," and before you saw the instrument "H," have any conversations with him about the talking-machines?

A. Yes, sir.

Cross-Q. 42. What did he say at those interviews?

A. He was talking about getting the talking-machine patented. All that kept him from it was that he had not the means of getting it patented. That was his general conversation on all the interviews that we had about it.

Cross-Q. 43. Did you know of his doing any work on talking-machines after you first saw the machines "A," "D," and "E," and before you saw the machine "H"?

A. That I could not say. I was not about him when he was working.

Cross-Q. 44. Did you know of his doing any work on talking-machines after you saw the instrument "H"?

A. No, that I don't know. I have not been in his place since the fall of 1877. I moved to Lancaster county in the spring of 1878.

Cross-Q. 45. Did you know of his doing any work on talking-machines before you moved away, and after he showed you instrument "H"?

A. That I don't know.

Cross-Q. 46. Did you ever, at any time, ask him to let you see any of the instruments tried, or hear them talk?

A. No, sir; I did not ask him.

Cross-Q. 47. Did he ever offer to let you hear them or try them?

A. We talked something about it one day there; he had it in operation, he said. I did not get him to use it at all. What little time I had there, he showed me a clock he had hanging against the wall there, run by electricity. What time I had, then, was consumed and I had to leave.

Cross-Q. 48. When was that?

A. That was some time in 1875 or 1876. I would not be certain which it was.

Cross-Q. 49. In your answer to the thirty-third cross-interrogatory, referring to the instrument marked "C," you used the expression, "when he first commenced to work on it." Did you see him when he first commenced to work on it?

A. No, sir; my idea was given wrong. I meant the first time he called my attention to it. I did not see him work at it at all. He may have worked on it a year before, or two. He never called my attention to it 'till that time.

Cross-Q. 50. At the time when he first called your attention to that instrument, what did he say about it?

A. He told me he was working on a talking-machine.

Cross-Q. 51. Is that all that he told you about it?

A. No, sir; he told me it was to take the place of telegraphing. That was his first idea—the way he conveyed it to me.

Cross-Q. 52. At that time, did he say anything about patenting it?

A. Yes, sir.

Cross-Q. 53. What was it?

A. If he had money enough he would take out a *caveat*, but he was too poor.

Cross-Q. 54. Was that the first time that he ever said anything to you about a talking-machine?

A. That was the first time he called my attention to it.

Cross-Q. 55. Was that the first time when he first showed you the instruments "B" and "F?"

A. Yes, sir; but it is not all here—not all to this machine ["B,"] nor to this, ["C."] There was some kind of a thing that closed up this, [indicating end of tin tube of "B" next to electro-magnet,] and there was something here, [indicating the portion of the board of instrument "C," marked "X" now by the examiner,] but I don't know what it was.

Cross-Q. 56. Was the instrument "F" in the same condition then that it is now?

A. Yes, sir; I think it was.

Cross-Q 57. Where did you reside at that time?

A. Shiremanstown, Cumberland county.

Cross-Q. 58. How long had you resided there, and how long did you continue to reside there?

A. I was born there. Then I was in the army four years and three months. I was away from home then. After I came home, I worked in Pittsburgh for J. C. Biddle from 1865 to 1868. I moved back to Shiremanstown in the spring of 1868, and remained there 'till the spring of 1871. Then I moved to Cleveland, Ohio, in 1871. Was there till the fall of 1873, when I moved back to Shiremanstown, where I remained 'till the spring of 1878. I then moved to Mount Joy, where I reside yet.

Cross-Q. 59. Were you accustomed to visit Drawbaugh's shop, or to see him from the fall of 1873, when you moved back from Cleveland, until the fall of 1874?

A. No, sir; I was not in his shop.

Cross-Q. 60. Were you accustomed to go to his shop before you went to Cleveland?

A. Yes, sir; I worked for him. That was in the fall of 1868, after I came back from Pittsburgh; I made the tools for that Faucet Company.

Cross-Q. 61. How long did you work for him, or for that company, and how often did you go to his shop until you went to Cleveland?

A. I suppose it took me about four months until I got everything fixed up that they wanted. How often I was at the shop, I could not say. Sometimes I would be there twice a day. The blacksmith-shop was about one eighth of a mile from Drawbaugh's shop.

Cross-Q. 62. What led you to make repeated visits to Drawbaugh's shop during the three years from the fall of 1874?

A. I had work for him to do. He made me taps several times, and he turned off several pairs of small axles for baby-coaches that I made. I visited him several times on Sunday, and went down to his shop.

Cross-Q. 63. Were you accustomed to see other people there at these visits?

A. There was nobody there on Sunday when I was there. During the week when I was there, there was sometimes several men employed, but it was oftener that there was nobody there.

Cross-Q. 64. What business was carried on in that shop during that time?

A. They were making Kline's patent axle there in 1875 and 1876—somewhere along there—working on that.

Cross-Q 65. How do you fix on August, 1875, as the time when you first saw instruments "A," "D," and "E?"

A. I got a pair of small axles turned. I think it was between the

11th and 15th. I could have known for a certainty, if I had looked in my book before I left home.

Cross-Q. 66. Did not you have small axles turned more than once?

A. Twice.

Cross-Q. 67. What makes you name the fall of 1876 as the time when you first saw instrument "H?"

A. During the fall of the Centennial, Mr. Drawbaugh stopped at my shop in Shiremanstown, and looked at a patent blower that I had there in use. After he got through with that, he invited me to come to see him. I went down to the shop on Sunday,—two weeks, I think, afterwards,—and he showed me this talking-machine "H," this large one. That is the way I fix the time.

Cross-Q. 68. Was there anything said by him or you at the time of his visit to you, or of your visit to him two weeks later, about the Centennial, in connection with instrument "H," which leads you now to connect them?

A. No, sir.

Cross-Q. 69. Why, then, do you connect them?

A. Him and I was talking about the Centennial at the door of my shop. He asked me whether I had been at the Centennial, and I told him no. I showed him my blower, and he said he had a better one, and wanted me to bring my blower down and he would make an improvement on the one I had.

Cross-Q. 70. Whereabouts in the room, where you saw the talking-instruments, were they when you saw them?

A. I think, from the way the building stands, they were in the north-west corner, on a table, in a place fixed off in the corner. I think you would call it the north-west corner. On the west side of the room, he had on a table different models and patterns of different things. I did not inquire what they were particularly.

Cross-Q. 71. Whenever you went to that room, did you see the talking-instruments there?

A. Yes, sir.

Examination taken, reduced to
writing, and by the witness af-
firmed and subscribed to before
me, this 25th day of May, 1881.
FRED. M. OTT,
Examiner.

W. H. BATES.

PHONE COMPANY,-1

Adjourned until May 26th, at 10, A. M.

May 26, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Smith for complainants, and Mr. Hill, Mr. Jacobs, and Mr. Abraham for respondents.

DANIEL RUPP, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. Forty eight years; Spring Garden, Lancaster county; coachmaker.

Q. 2. Are you acquainted with Daniel Drawbaugh, of Eberly's Mills? If so, how long have you known him?

A. About thirty years.

Q. 3. Have you visited his shop frequently during the last seven years?

A. Yes, sir.

Q. 4. During your visits there, has he ever shown to you any instruments which he called talking-machines?

A. Yes, sir.

Q. 5. When was the first time that he showed you his talking-machines?

A. In 1874.

Q. 6. What time of the year 1874?

A. June or July.

Q. 7. Is there any circumstance or event in your memory that enables you to fix the time as in June or July, 1874? If so, state it.

A. Yes, sir; I was building that summer. I went down to a quarry, close to his shop, to see about getting some stone.

Q. 8. When you went down to get the stone from that quarry, did you go into his shop,—and what did he show you that he called a talking-machine?

A. Yes, sir; I went into his shop. He showed me tumblers, he showed me wire covered over, and he showed me a machine for covering wires; he showed me magnets that he had up against a partition or on a shelf, and showed me something round, made out of walnut wood, that was attached to the wire, and he showed me a number of the same kind of concerns that he had in a case, different sizes of them. He then was going to talk to me over this wire, and could not. He said it was out of fix then.

Q. 9. Did you visit his shop during the year 1874, subsequent to the months of June and July?

A. Yes, sir.

Q. 10. About how often?

A. Twice, I think, after.

Q. 11. Did he again, at these subsequent visits, show you these instruments that he called talking-machines?

A. Once, afterwards. I was there once when the shop was shut—locked—and I could not get in.

Q. 12. Did you visit him subsequently to June and July, in that year, and get into his shop?

A. Yes, sir.

Q. 13. Did he then show you his instruments that he called talking-machines?

A. Yes, sir.

Q. 14-15. Please examine the various machines now spread before you on the table, and tell the examiner which, if any of them, you identify as having seen as Mr. Drawbaugh's shop at the visits concerning which you have testified.

[*The instruments on the table are marked "A," "B," "C," "D," "E," "F," "G," "K," "L," "M," "N," and "O."*]

A. This ["F"] was the one I remember. Something like this ["A"] was the one attached to the wire. This ["C"] is one that was on a shelf up against the partition. Now, there were some having a mouth-piece like that [taking up "O," and indicating its circular mouth piece] that were in the case. I saw some with curled irons on like that, [indicating the curled magnet on "D,"]—something of that shape, I can't tell whether these are the identical instruments or not. Then, there were some large—I think some larger than this ["K"] in that case.

Q. 16. You spoke of an instrument like "A" being attached to the end of the wire. Please explain what wire you refer to.

A. That is the wire that went through the partition and came down to the—there was a magnet on this here [indicating the part of machine "C" previously marked "X" by the examiner,] and from that it came down to the table—the wire did—where there were tumblers like this here ["F"] standing.

Q. 17. How many tumblers were there, to the best of your recollection?

A. Two.

Q. 18. Did they each have a wooden cap, like the one on the tumbler before you now?

A. No, sir.

Q. 19. Did you notice any material inside of either or both of them?

A. They were coated inside with something white.

Q. 20. Was the bottom out of both of them?

A. No, sir.

Q. 21. I understand you to say that at the first visit, in June or July, 1874, Mr. Drawbaugh endeavored to operate his talking-machines, but that he told you they were not in proper condition then. Did he operate them when you visited him the second time?

A. Yes; the first time I went there, (it was in June or July,) we went to his office or room that he had partitioned off from the other part of the shop. When we got to the door, he says he wants to show me his talking-machine, and he gave me an instrument in my hand, something much like this ["A"] and told me I should put it up to my ear. He then went into his room and shut the door, and he was going to talk to me, but said he could not, it was out of fix. Then I was there afterwards, and then he spoke to me through the machine.

Q. 22. When he spoke to you through the machine, where were you and where was he?

A. I was outside of that room, as near as I can recollect, about eight feet from the partition. He was about seven or eight feet from the partition, inside, as near as I can remember.

Q. 23. Did you understand, through the instrument that you held to your ear, what Mr. Drawbaugh said to you?

A. Yes, sir.

Q. 24. Did you repeat to him the language you heard through the machine?

A. Yes, sir.

Q. 25. And what did he reply?

A. He said it was correct.

Q. 26. Do you recollect any of the language or words that you heard through the machine that you were listening at?

A. Yes, sir.

Q. 27. What do you recollect?

A. He mentioned the names of some of the cities in Pennsylvania, with a sentence that he spoke.

Q. 28. What cities do you recollect?

A. He mentioned Philadelphia or Pittsburgh, or may have mentioned both of them.

Q. 29. Did you recognize the voice as that of Daniel Drawbaugh?

A. There was not any person in the shop but him and I.

Q. 30. Could you have heard him speak, and understood what he said, situated as you both were, with a closed partition between you, except through the instrument you held to your ear?

A. Not unless he had spoken very loud. I could tell that the sound came to my ear through the instrument.

Q. 31. You have stated that you remember having heard the names of certain cities distinctly. Did you hear other words and language which you cannot now call to memory equally as distinct?

A. Yes, sir.

Q. 32. What description of wire was used to connect these instruments?

A. Copper, covered with silk or cotton. I rather think it was silk that they were covered with.

Q. 33. Did Mr. Drawbaugh tell you the uses to which his talking-machine could be put?

A. Yes, sir.

Q. 34. What did he say in this respect?

A. That it would take the place of telegraphing. I laughed at him at the idea of that, and he said, "Rupp, you will see it will."

Q. 35. Did he state what distance he could talk through by means of his talking-machines?

A. No; there was nothing said about distance. If it would take the place of telegraphing, it would include most all distances.

Cross-examined by Mr. Smith:

Cross-Q. 36. You say you have visited Drawbaugh's shop frequently during the last seven years. Where have you resided during that time?

A. At Shiremanstown, Cumberland county, Pa.

Cross-Q. 37. How far from Drawbaugh's shop?

A. About three miles.

Cross-Q. 38. How long have you resided at Spring Garden?

A. Since the 30th of March, 1881.

Cross-Q. 39. Where did you reside for the five or six years previous to the summer of 1874?

A. At Shiremanstown.

Cross-Q. 40. Did you, during that time, occasionally or often, visit Drawbaugh's shop?

A. Yes, sir.

Cross-Q. 41. What led you to go to his shop during that time, or during the seven years following?

A. I had been interested in a patent mill-bush, and they were manufacturing them there at that shop. They also manufactured patent molasses faucets, and I still went there to see. The reason, it was under my charge, and I seen them work at these faucets. I used them also, in my business of storekeeping in my barrels of molasses; and these mill-bushes I had the oversight of, seeing after them and sending them out, and so on.

Cross-Q. 42. During what years was this manufacture of the mill-bushes carried on in Drawbaugh's shop?

A. I think it was 1866 and 1867. If I had thought of it and looked at my books, I could have told exactly.

Cross-Q. 43. During what years was the manufacture of faucets carried on in that shop?

A. Those same years up until now. The last visit I paid there they were still working at them.

Cross-Q. 44. When was the last visit?

A. I think it was the commencement of last July, I was there last.

Cross-Q. 45. Has the manufacture of faucets been carried on during all the years from 1866 and 1867 to that time?

A. No, sir.

Cross-Q. 46. During what years, then, was that manufacture carried on?

A. There was one year that Mr. Drawbaugh lived at Mechanicsburg. That year there was no faucets manufactured, that I can remember. Some years there was very few manufactured. He was improving on them, and sometimes they would only make a few of some improvement that he would make on them.

Cross-Q. 47 Aside from the year when Mr. Drawbaugh resided at Mechanicsburg, do you think the manufacture of faucets was carried on, to a greater or less extent, during all the time from 1866 and 1867, to the summer of 1880?

A. Yes, sir.

Cross-Q. 48. How many men do you think were at any time employed in that manufacture?

A. I think at one time they had about eight men employed.

Cross-Q. 49. When was that?

A. I think that was in 1866 or 1867,—somewhere along there.

Cross-Q. 50. How many men do you think were employed there in that business during 1869, 1870, and 1871?

A. I think sometimes there were three in the shop, sometimes two, and sometimes only one.

Cross-Q. 51. Take the three following years, 1872–'3 and '4. How many were there?

A. Well, about the same way. Sometimes they had one man there, which was Mr. Drawbaugh; sometimes him and his brother; and sometimes they had one man there besides those two.

Cross-Q. 52. Do you remember what year it was that he lived at Mechanicsburg?

A. No, sir.

Cross-Q. 53. After he came back from Mechanicsburg, how many men were employed in the faucet business, during the next two or three years?

A. Last summer I think they had two men employed part of the time, besides Mr. Drawbaugh; and the summer previous, his brother was working in there.

Cross-Q. 54. What occasion had you to go to his shop frequently, during the last seven years?

A. Sometimes on business; sometimes out of curiosity to see what he was working at.

Cross-Q. 55. What did you see him working at during those years?

A. Sometimes he was making drafts; sometimes he was working on faucet patterns; sometimes at clocks.

Cross-Q. 56. At any of the visits after 1874, did you see any of his talking-machines?

A. Yes, sir.

Cross-Q. 57. When was that?

A. When I went there still to the shop, he would show me all that he had been working at, and improvements that he had been making.

Cross-Q. 58. What talking-machines did he show you during any of the years after 1874?

A. I don't remember any that he particularly showed me—any talking-machine. I was more interested in his clock that he was then making.

Cross-Q. 59. You saw talking-machines after 1874. What ones did you see during the years after 1874?

A. It was something about like what he had showed me before. I don't know that I paid any particular attention to it after that year.

Cross-Q. 60. Where in the shop did you see them, when you did see them?

A. I think it was the east corner, where he had his room, on the second floor.

Cross-Q. 61. In the same room where you first saw them?

A. I think so.

Cross-Q. 62. Did he say anything to you about them during the years after 1874?

A. No conversation that I can recall to remembrance. I generally was hurried somewhat, and we would talk over a number of things,—but there is nothing about those talking-machines that I can distinctly remember.

Cross-Q. 63. Have you told us all that he said to you about them at the first two times that he showed them to you?

A. No, sir.

Cross-Q. 64. What else did he say about them?

A. I urged him to get it patented. He said that he had not it completed yet, or in shape to get patented. That he wanted to make some improvements on it.

Cross-Q. 65. Did you ever, after that, say anything to him about getting it patented, or about his getting it in shape to get it patented?

A. I think I did.

Cross-Q. 66. When was that, and what did you say to him?

A. I can't tell the year when it was, but I urged him still to get it patented, and his plea was poverty, afterwards.

Cross-Q. 67. Did you ever talk with him about getting it patented more than once after you saw the instruments?

A. I can't tell how often I have talked to him about it. I spoke to him several times about getting it patented, but the number of times, I could not say how often.

Cross-Q. 68. At any of the times when you met him, after the first two times, when you saw the instruments, did you make any inquiries of him about the improvements on it, or say anything to him about the improvements?

A. I don't remember that we had any particular conversations about the improvements after those two first times.

Cross-Q. 69. Why were you more interested in the clock, that he was making after 1874, than you were in his talking-machines?

A. I had some notion of taking an interest in that clock.

Cross-Q. 70. In what years was that?

A. I don't know that I can give you the exact date. I think it was in 1878 or in 1879. It may probably have been earlier than that.

Cross-Q. 71. Did you talk with him about taking an interest in it? If so, in what way did you propose to become interested?

A. No, sir; I never said nothing to Mr. Drawbaugh about taking an interest in it.

Cross-Q. 72. Did you have any talk with any persons about taking an interest in it?

A. No, sir.

Cross-Q. 73. Why did you think of taking an interest in the clock rather than in the talking-machine?

A. I did not think it would take as much money to go into that as it would to go into the others.

Cross-Q. 74. Did you, at any time, talk to him about taking out a patent or patents on his clock?

A. I think I did.

Cross-Q. 75. When was that, and what did you say to him?

A. I can't tell what date that was. I can't call to remembrance the conversation, but I remember speaking to him something about getting the clock patented.

Cross-Q. 76. When he talked to you through the talking-machine, what instrument did he use?

A. Some of these [taking up "F" in his hand] was what he was showing me, and what he used. These—the door was shut and I could not see what he held in his hand, but the wires were connected from where I was, and I suppose that is what he used.

Cross-Q. 77. What instruments were the wires connected to in the room where he was?

A. There was a machine something of this kind [taking up "A,"] where there was one end of the wire fast, and then there was an end of

HONE COMPANY,-1

the wire fast to some of those tumblers that he had standing on a table there.

Cross-Q. 78. Was the wire connected to any other instrument beside those you have named at the time he was speaking to you?

A. It appears to me there was a machine with a bell on, that they were attached to. I don't remember whether that was the first time I was in there or the second time.

Cross-Q. 79. You mean the second time when you saw the talking-machines?

A. Yes, sir.

Cross-Q. 80. Will you look at the instrument with a bell on it, marked "H," and state whether that is the instrument, or like the instrument with a bell on it, that you saw connected to the wires at either the first or second time that you saw the talking-machines?

A. I don't know whether that is the instrument. I seen an instrument in his shop there, but whether it was the first or second time, I could not tell. It was an instrument something like that. I can't tell what time it was that I saw it.

Cross-Q. 81. Did Mr. Drawbaugh open the instrument and show you what was inside?

A. Not that I remember.

Cross-Q. 82. What business were you engaged in in 1874, and from that time down to the present time?

A. Coach-making.

Cross-Q. 83. Before that time what was your business?

A. I was raised on a farm and worked on that 'till I was nearly sixteen years old. Then I was nearly five years on the railroad. Then I worked on the farm awhile again. Then I went to store-keeping in 1856, and remained at that business till the spring of 1874. I was also engaged in brick-burning, awhile. I commenced coach-making, the spring of 1869.

Cross-Q. 84. Had you any interest or connection with the faucet business that was carried on at Drawbaugh's shop, except that you purchased faucets?

A. No, sir.

Cross-Q. 85. Have you, at any time before this, made an affidavit in relation to Drawbaugh's talking-machine?

A. Yes, sir.

Cross-Q. 86. When did you make it and who was present when you made it?

A. I think it was in the fall of 1880, or early in the winter. Mr. Jacobs, Mr. Drawbaugh, and a Justice of the Peace—I don't remember his name—were present.

Cross-Q. 87. Do you know that the telephone is in use in Harrisburg and other places at the present time?

A. Yes, sir; I know they are in use in Harrisburg, here.

Cross-Q. 88. When did you first know of their use in Harrisburg here, either by seeing them or by hearing or reading about them?

A. As near as I can remember, I think it was about a year ago. Probably a little longer than that.

Cross-Q. 89. Had you ever, before you knew of their use here, known, or heard, or read of their use in other places?

A. Yes, sir.

Cross-Q. 90. How long before, should you think?

[*Question objected to, as well as all preceding questions and answers in reference to the use of the telephone, as not proper cross-examination and as hearsay evidence.*]

A. I think about two years ago.

Cross-Q. 91. Do you remember how you first learned about them?

[*Same objection.*]

A. From the papers.

Cross-Q. 92. What papers?

[*Same objection, and that it is improper and incompetent to prove the contents of a newspaper by the witness's memory.*]

A. I can't tell you in what paper I saw it first. I have been getting a number of papers.

Cross-Q. 93. Did you ever see anything about the telephone in the Harrisburg papers?

[*Same objection.*]

A. Yes, sir.

Cross-Q. 94. In what other papers have you seen anything about it?

[*Same objection.*]

A. I think I saw it in the *Messiah's Herald*, published in Boston.

Cross-Q. 95. How long ago was that?

A. I really can't tell definitely. I think something about like two years ago.

Cross-Q. 96. Have you been in the habit of reading the Harrisburg papers, or any of them, for the last four or five years?

A. Yes, sir.

Cross-Q. 97. Which ones?

A. I have been a reader of the *Telegraph*, I don't know how long, though. I don't know whether it is four years yet or not. Occasionally, I would read an *Independent* or a *Patriot*, but the *Telegraph* was the paper that I read nearly every day when I was home. I have read the *Messiah's Herald*, of Boston, for about twenty-five years.

Recess for dinner until 2.30, P. M.

May 26, 1881, 3, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Re-direct examination of Mr. Rupp by Mr. Abraham:

Q. Q. 98. Do you recollect where and when you first saw a telephone in public use?

A. Yes, sir.

Q. Q. 99. Where was it, and when?

A. At Philadelphia, at No. 945 Ridge avenue, I think,—just about two years ago, now.

Q. Q. 100. Who showed it to you?

A. Mr. Middleton.

Q. Q. 101. Now state the circumstance, and what was said in reference to it.

A. I was sitting in the office talking with Mr. Middleton. There was a gentleman came in, and asked them the price about iron pipe, I think, if I am not wrong. He said he would have to ask a party down Third street. He told me then he wanted to talk with that party a little, and then I asked him why—how he would do that. Then he said I should come into their private office, where they had this telephone. Then I asked him if he had the Drawbaugh machine. He said, "No, sir." He told me the name of the machine, but I don't recollect what that was any more. Then, after we came out again, I got talking to him about this Drawbaugh machine. I can't remember our conversation about it, any more.

Q. Q. 102. Did you listen at the telephone in Mr. Middleton's establishment?

A. Yes, sir.

Q. Q. 103. And did you recognize the character of the sound that came through it as in any way peculiar?

A. Yes, sir; like the sound that I heard through Drawbaugh's machine.

Q. Q. 104. In reply to your cross-question sixty-four, you stated that you had urged Mr. Drawbaugh to get his machine patented, and that he had not then it in shape to have it patented, and that he wanted to make some improvements on it, and afterwards, when further cross-examined, you testified that when you urged him at other times to get it patented, he put in a plea of poverty. Please state, as near as your recollection serves you, how many times you spoke to him about getting it patented and how often he plead poverty.

A. I could not state how often I spoke to him. I might have spoke three or four times, or a half dozen of times. I know he plead poverty several times that I spoke to him about it, after that first conversation, when he said he did not have it in shape yet.

Q. Q. 105. You have stated that you made several visits to Mr. Drawbaugh at his shop after June and July, 1874. What, in these subsequent visits, if anything, did Mr. Drawbaugh say in reference to improvements he was making in his talking-machine?

A. He told me several times that he was working at it.

Re-cross by Mr. Smith:

Re-cross-Q. 106. What is Mr. Middleton's full name, and what business was carried on at the place where you saw the telephone in operation in Philadelphia?

A. The one that I was talking with is, H. W. Middleton. They are iron merchants.

Re-cross-Q. 107. Who else was present when you were talking about the telephone?

A. In the private office, there was no one but Mr. Middleton and myself. In the other room, there was the clerk, behind the desk. Mr. Bell, I think, was his name.

Re-cross-Q. 108. After you came home, did you, at any time, have any talk with Mr. Drawbaugh about what you had seen in Philadelphia?

A. Not that I remember.

PHONE COMPANY,-1

Re-cross-Q. 109. In your answer to the one hundred and fifth interrogatory, relating to talks with him about improvements on his talking-machine, you say, "he told me several times that he was working at it." How many times do you think he told you that, and when did the conversation take place?

A. He may have told me two or a half dozen times. I could not tell the number of times. Some time between 1874 and 1878. I could not fix the time precisely. I usually went there in the summer time.

Re-re-direct by Mr. Abraham:

Q. Q. Q. 110. Do you mean to say, then, that the conversations in regard to improvements were on divers occasions, extending from the year 1874 to 1878?

A. Yes, sir.

Examination taken, reduced to
writing, and by the witness affirmed
and subscribed to before me, this
26th day of May, 1881.
FRED. M. OTT,
Examiner.

DANIEL RUPP.

WILLIAM S. DELLINGER, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am thirty-four years old; residence, York, Pa.; I am a Miller by occupation, but am not working at it at present. I am carpentering.

Q. 2. Did you formerly reside at Eberly's Mills, Cumberland county, Penna.? If so, from what time to what time?

A. From March 1, 1876, to April 4, 1881.

Q. 3. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him since the first of March, 1876,—a little better than five years.

Q. 4. Did you ever see any talking-machines at his shop while you lived at Eberly's Mills?

A. Yes, sir.

Q. 5. Please state the time when you first saw talking machines at his shop.

A. Some time—I can't just say the exact time—in March, 1876.

Q. 6. How came you to go to his shop at that time?

A. Jeremiah Fry asked me to go along down to see some of the machineries that Mr. Drawbaugh was making. We went down together.

Q. 7. In what part of the shop did you see the talking-machines at that time?

A. It was in the first room that you entered, after going up-stairs.

Q. 8. The stairs,—outside of the building now,—only run up to the top of the basement, so that you enter on the first floor over the basement, or cellar. How were they arranged in 1876?

A. They run up to the second story, so that I entered on the second floor.

Q. 9. How frequently were you in Mr. Drawbaugh's shop from March, 1876, to April, 1881?

A. I have been there very often. Sometimes as high as twice a day.

Q. 10. Did you ever see any talking-machines there after March, 1876? If so, how often?

A. Yes, sir; I could not just say how often.

Q. 11. Give us as near a correct idea of it as you can.

A. Really, I could not state how often. I might possibly have seen it a hundred times.

Q. 12. Did you ever talk through it, and hear others talking through it?

A. Yes, sir.

Q. 13. Please look at the machines now shown you, marked from "A" to "O" inclusive, and see if you recognize any of them as the machines you saw in Drawbaugh's shop in March, 1876. If so, please point them out.

A. This is the one I first saw [taking up "E.] This was the next one that I saw in March, 1876, [indicating "B."] This I saw afterwards,—I can't just say exactly what month [indicating "A."] The fourth one was this [indicating "C."]

Q. 14. Did you first see the machines "E" and "B" at the same visit?

A. Yes, sir; at the same visit.

Q. 15. But saw "E" before you saw "B?"

A. Yes, sir.

Q. 16. Please look at this machine "H," and state whether you ever saw that at Mr. Drawbaugh's shop.

A. The one that I saw, I thought that it was square. It was not sloped off, but had a bell on it. It looked like this inside [looking at the inside arrangements of "H."]

Q. 17. Where was that machine that you saw that looked like this machine "H?"

A. It was in the next room to the left as I came in. It was either screwed or nailed on to the door of a closet, to the best of my knowledge.

Q. 18. About how long ago was it that you first saw the machine like "H," to the best of your recollection?

A. About two years, or a little better.

Q. 19. Before or after the Clock Company commenced operations there?

A. After the clock manufacture was going on.

Q. 20. Before or after the Clock Company stopped operations?

A. About the time the Clock Company was going on, I saw it first.

Q. 21. Did you ever see these machines there, marked "G" and "O?"

A. Yes, sir.

Q. 22. About what time did you first see them, to the best of your recollection?

A. I can't fix the date definitely. It was in the year 1877.

Q. 23. Did you ever talk through this machine "H," or hear any one talk through it, there at the shop?

A. Not this one; it was one as big as this,—I thought it was square. It looked like this.

Q. 24. I mean, did you talk through, or hear any one talk through, the machine that was fastened to the cupboard door, as you have testified?

A. Yes, sir; I heard Mr. Drawbaugh talk through.

Q. 25. Where were you when he was talking through it? In what part of the building were you?

A. I was down-stairs, at the receiver.

Q. 26. What kind of a receiver did you have down-stairs at that time—any one of these machines on the table?

A. I don't remember what kind of a one it was, any more. I could not say exactly, something like this ["N"] in shape and size.

Q. 27. Was it connected with the machine that was attached to the cupboard door, and if so, how?

A. It was connected by two wires. I can't exactly say where the wires were on—at what points they were attached to the instruments, I mean.

Q. 28. When Mr. Drawbaugh talked into the machine up-stairs, and you listened at the receiver down-stairs, did you distinctly hear and understand what he said through the machines?

A. Yes, sir.

Q. 29. When you were operating those two machines, did you ever change positions,—Drawbaugh going down-stairs, and you taking your position upstairs, at the machine attached to the cupboard door?

A. Yes, sir.

Q. 30. What was done then?

A. I talked then, and Drawbaugh was at the receiver.

Q. 31. Give us an idea of how many times you and Drawbaugh operated that machine attached to the cupboard door, and its receiver, in the ways you have mentioned.

A. I could not say how often; probably a half a dozen times.

Q. 32. Was it on different days, or not?

A. Yes, sir.

Q. 33. During the time that the Clock Company,—composed of Mr. Shettel and the Grissingers,—was in operation there at the shop, did you see Mr. Drawbaugh doing anything with his talking-machines, or not?

A. Yes, sir; he was working on them after night.

Q. 34. How frequently were you there after night, when Drawbaugh was working at his talking machines?

A. I was there pretty often till nine or ten o'clock.

Q. 35. How late was he in the habit of working at his shop at nights?

A. I have seen him come home at eleven and twelve o'clock at night.

Q. 36. How late have you seen his light in the shop at nights?

A. I have seen it as late as twelve o'clock.

Q. 37. How happened you to be up at that time of night?

A. I woke up generally about midnight, as I had occasion to.

Q. 38. Do you recollect seeing this machine "J" there at the shop at any time?

A. I don't remember of it. The one I saw, this mouth-piece was larger, I think, and had a bell on top. It was not the machine attached to the cupboard door that I refer to.

Q. 39. How did its size and shape compare with the machine "J?"

A. It was shaped like this, and its size was like it, only there was a bell on top.

Q. 40. Did anybody talk through it?

A. No, sir.

Q. 41. How many times do you think you were in Mr. Drawbaugh's shop during the year 1876?

A. I could not tell.

Q. 42. A great many times, or only a few times?

A. Pretty often.

Q. 43. During the year 1877, were you in Mr. Drawbaugh's shop a great many times, or only a few times?

A. Pretty often.

Q. 44. During the years 1876, 1877, 1878, and 1879, as you would be in Mr. Drawbaugh's shop from time to time, what would he generally be working at?

A. Experimenting on clocks and telephones

Q. 45. During all the years that you lived there at Eberly's Mills, what invention was Mr. Drawbaugh spending the most of his time and labor upon, so far as you have opportunity for observation?

A. The most was on the telephone. His whole heart and desire was on the telephone.

Q. 46. Did you talk with him about it a good deal during those years?

A. Yes, sir.

Q. 47. Did he ever say anything about patenting it? If so, when did you first hear him speak of that?

A. Not to my recollection.

Q. 48. Did he ever say anything in regard to his financial means, or want of means, in connection with the telephone or talking-machine?

A. He did not, to my recollection, in regard to the telephone. He always pleaded poverty to me, when I asked him for money. I sometimes asked him for fifty cents, and he said he could not give me ten.

Q. 49. Did you ever see the machine "F?"

A. I have no recollection of that.

Q. 50. Have you any recollection of the machine "B" being used at any time while you were there?

A. I have no recollection.

Q. 51. State whether Mr. Drawbaugh ever told you that he had perfected his talking-machine invention. If so, when first?

A. I don't recollect anything of it.

Q. 52. How many different talking-machines or instruments did you ever see at Mr. Drawbaugh's shop, in all the years 1876, 1877, 1878, and 1879? If you can't give the number exactly, give us an idea of it.

A. Indeed, I could not say how many.

Q. 53. You have testified that you saw instruments "E," "B," "A," "C," "G," and "O;" also an instrument about the size of "H," with a bell on top; also an instrument about the size of "J," with a bell on top; also a receiver, that was used down-stairs, about the size and shape of "N." Did you see any others there, that you cannot identify, or not?

A. Yes, sir.

Q. 54. Did Mr. Drawbaugh ever tell you how far he could talk through these machines from one place to another?

A. I have no recollection.

Q. 55. Did he ever tell you how they were operated—on what principle they worked?

A. He told me, but I could not remember.

Q. 56. Did he tell you whether they were operated by electricity, or not?

A. I don't remember.

Cross-examined by Mr. Smith:

Cross-Q. 57. You have spoken about Mr. Drawbaugh being engaged on clocks and telephones during the years you were there. Do you know of his doing anything on faucets during those years?

A. Yes, sir.

Cross-Q. 58. In what years was he at work on faucets?

A. I could not just exactly say. It was 1878 and 1879, to the best of my knowledge.

Cross-Q. 59. In what year did the Clock Company carry on its business?

A. I could not just exactly say.

Cross Q. 60. I noticed that you used the word "telephone" in speaking of what Drawbaugh did. Did you and Mr. Drawbaugh use that word, during the years you were there, while talking about his instruments?

A. In the beginning, we used the word "talking-machine," afterwards, "telephone."

Cross-Q. 61. Can you tell about when it was that you began to use the word telephone?

A. I could not.

Cross-Q. 62. I suppose you did not know, during any of those years, that telephones were in use in Harrisburg, and in other places, did you?

A. Within the last two years or two years and a half, I have heard and read about these telephones.

Cross-Q. 63. Did you know of their being in use in Harrisburg at any time?

A. Not 'till lately. About February last, I saw the first in Gross's drug-store. I saw one in P. A. & S. Small's store, in York, afterwards.

Cross-Q. 64. From whom did you first hear about telephones other than those of Mr. Drawbaugh, or where did you first read about them?

A. I can't remember from whom. If I mistake not, I first read of them in the Harrisburg *Patriot.*

Cross-Q. 65. Do you remember what the paper said about them?

A. I don't remember, but I know it was the Bell telephone, mentioned in the paper.

Cross-Q. 66. Do you remember about how long ago that was?

A. Indeed, I don't remember. It is probably two years, maybe a little more.

Cross-Q. 67. Do you remember anything that was said about it?

A. While I think about it, I remember it stated that the Bell telephone is better than Edison's.

Cross-Q. 68. Before that time, as I understand you, you had not heard anybody say anything about any other telephone than Drawbaugh's.

A. No, I had not.

Cross-Q. 69. Were you in the habit of reading the Harrisburg *Patriot*, or any other Harrisburg papers, during the time that you lived at Eberly's Mills?

A. Not very often.

Cross-Q. 70 And did you read any paper constantly during that time?

A. Yes, sir; the York *Daily*; also, the *American Volunteer* of Carlisle.

Cross-Q. 71. When you read the article in the *Patriot* about the telephone, did you talk with Mr. Drawbaugh about it?

A. I don't remember that I did.

Cross-Q. 72. Did you ever talk with him about anything that you read in the papers about the telephone?

A. I have no recollection.

Adjourned until 9.30, A. M., May 27, 1881.

May 27, 1881.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Examination of Mr. Dellinger continued:

Cross-Q. 73. You speak of asking Mr. Drawbaugh for money; what occasion did you have to ask him for money, and how often did you ask him for it?

A. I needed the money. I asked him pretty often. He owed me for flour and feed, and also for rent.

Cross-Q. 74. Do you remember how large your bill for flour and feed against him was at any time?

A. For flour and feed, I remember it was as high as forty-five and fifty dollars.

Cross-Q. 75. Did you own the building where his shop was?

A. No, sir.

Cross-Q. 76. What did he owe you rent for?

A. The house he lived in.

Cross-Q. 77. How much rent did he pay you a year?

A. The last year he paid me forty dollars. He paid me, I think, all along, forty dollars while he lived in my house, except the last year, 1880, he paid fifty dollars to the assignee.

Cross-Q. 78. How many years did he live in your house?

A. It was in the estate a year, that is, through 1880. For three years I collected the rent. The fourth year, which was 1880, the assignee collected it.

Cross-Q. 79. You used to meet him frequently, I suppose, not only at his shop, but at his house and other places?

A. Yes, sir.

Cross-Q. 80. Did he use to come to your mill-office frequently?

A. Sometimes.

Cross-Q. 81. Do you remember his getting up a model for the patent on his faucet, some time in the year 1878 or 1879?

A. I remember of him getting up a model, but could not exactly say what year, unless I would refer to my book-entry.

Cross-Q. 82. What occasion had you to make any book-entry about that model?

A. He got flour along at that time.

Cross-Q. 83. Did not he get flour during all the time that you lived there?

A. Oh, yes.

Cross-Q. 84. What, then, would your book-entries tell you as to the time when he made the model?

A. He had worked there, in my mill-office, on this model, for a few days. For the reason was, he had no coal at his shop to keep warm.

Cross-Q. 85. Do your book-entries contain a record of the fact, that he worked on the model at your mill-office?

A. It don't just exactly say he worked on the model. I charged flour at that time that he was working on the model.

Cross-Q. 86. But you charged flour at a great many other times, did you not?

A. Yes, sir.

Cross-Q. 87. Do any of your book entries say anything at all about his working at your office?

A. It don't say that he was working there, but I can show by the book-entry that Drawbaugh was working on his model right after I had discharged my miller.

Cross-Q. 88. Does your book-entry state anywhere that Drawbaugh was working on his model at your office?

A. I have answered that before, that it don't exactly state that he was working on the faucet.

Cross-Q. 89 Does it state anything about his working there?

A. No more than the book-entries, by what I take it from, charging flour.

Cross-Q. 90. Now, will you state what your best recollection is, as to the year when he worked on the model at your office?

A. To the best of my knowledge, it was in 1878.

Cross-Q. 91. In the latter part of 1878, or the early part?

A. In the latter part.

Cross-Q. 92. You speak of an instrument having a bell on it, which was fastened to the door of a closet. Was that closet in a room on the same floor that Mr. Drawbaugh's office was on?

A. I don't know as he had, just exactly an office, but it was in the same room that he generally took parties in.

Cross-Q. 93. Was the instrument fastened to the outside of the door, or to the inside?

A. The outside.

Cross-Q. 94. So that anybody who went into his room could see the instrument when the door of the closet was shut, could they?

A. Yes, sir.

Cross-Q. 95. How long was that instrument fastened to the door in that way?

A. That I don't remember.

Cross-Q. 96. Did you see it there a good many times?

A. Pretty often.

Cross-Q. 97. You say, in answer to the 18th interrogatory, that, to the best of your recollection, you first saw that instrument about two years ago, or a little better. Now, as that is not a great while ago, and you saw it pretty often, won't you try to remember how long it remained fastened to the door?

[*Objected to, as the witness has already stated that he can not remember.*

A. I don't remember.

Cross-Q. 98. Do you remember seeing it after it was taken down from the door?

A. I don't remember.

Cross-Q. 99. Do you remember that it was taken down from the door, or remember of seeing the door without the instrument on it, at any time after you did see the instrument on it?

A. I have no recollection.

Cross-Q. 100. When you and Mr. Drawbaugh first talked about that instrument, what did he say to you about it?

A. I don't remember what he was talking about I can't remember what the words were any more. He used language, or words, that I did not know what they meant.

Cross-Q. 101. Did not you understand anything that he said about the instrument at the time that he first talked to you about it?

A. I could not say.

Cross-Q. 102. Do you remember the substance of anything that he said to you about that particular instrument, at any time? If so, please state it.

A. I don't remember.

Cross-Q. 103. If I understand you correctly, you first saw this instrument fastened to the closet-door before the Clock Company stopped its operations at that shop. Do I understand you correctly?

A. To the best of my knowledge.

Cross-Q. 104. You speak of talking through that instrument, or listening when Mr. Drawbaugh talked, probably half a dozen times. Can you tell me how long a period it was during which those half dozen trials were made?

A. I could not remember.

Cross-Q. 105. Can't you tell me whether they extended over a period of one month or a longer period?

A. I don't remember.

Cross-Q. 106. Do you remember how it was that Mr. Drawbaugh first came to show you the operation of that instrument?

A. He just took me in and showed me the telephone, and told me I should go down-stairs and listen what he says through this telephone.

Cross-Q. 107. Was that the first time you had seen that instrument?

A. To the best of my knowledge, it was.

Cross-Q. 108. How came he to show you the operation of the instrument at the several subsequent times?

A. That I don't remember.

Cross-Q. 109. At the several trials which you made of the instrument, did it operate just the same at one time as at the other times—that is, could you hear just as well what was said?

A. Could hear better the last; that is, I could understand better.

Cross-Q. 110. Did he say anything about having been improving the instrument or working on it in any way?

A. To the best of my knowledge, he did.

Cross-Q. 111. What did he say about it?

Cross-Q. 90. Now, will you state what your best recollection is, as to the year when he worked on the model at your office?

A. To the best of my knowledge, it was in 1878.

Cross-Q. 91. In the latter part of 1878, or the early part?

A. In the latter part.

Cross-Q. 92. You speak of an instrument having a bell on it, which was fastened to the door of a closet. Was that closet in a room on the same floor that Mr. Drawbaugh's office was on?

A. I don't know as he had, just exactly an office, but it was in the same room that he generally took parties in.

Cross-Q. 93. Was the instrument fastened to the outside of the door, or to the inside?

A. The outside.

Cross-Q. 94. So that anybody who went into his room could see the instrument when the door of the closet was shut, could they?

A. Yes, sir.

Cross-Q. 95. How long was that instrument fastened to the door in that way?

A. That I don't remember.

Cross-Q. 96. Did you see it there a good many times?

A. Pretty often.

Cross-Q. 97. You say, in answer to the 18th interrogatory, that, to the best of your recollection, you first saw that instrument about two years ago, or a little better. Now, as that is not a great while ago, and you saw it pretty often, won't you try to remember how long it remained fastened to the door?

[*Objected to, as the witness has already stated that he can not remember.*

A. I don't remember.

Cross-Q. 98. Do you remember seeing it after it was taken down from the door?

A. I don't remember.

Cross-Q. 99. Do you remember that it was taken down from the door, or remember of seeing the door without the instrument on it, at any time after you did see the instrument on it?

A. I have no recollection.

Cross-Q. 100. When you and Mr. Drawbaugh first talked about that instrument, what did he say to you about it?

A. I don't remember what he was talking about I can't remember what the words were any more. He used language, or words, that I did not know what they meant.

Cross-Q. 101. Did not you understand anything that he said about the instrument at the time that he first talked to you about it?

A. I could not say.

Cross-Q. 102. Do you remember the substance of anything that he said to you about that particular instrument, at any time? If so, please state it.

A. I don't remember.

Cross-Q. 103. If I understand you correctly, you first saw this instrument fastened to the closet-door before the Clock Company stopped its operations at that shop. Do I understand you correctly?

A. To the best of my knowledge.

Cross-Q. 104. You speak of talking through that instrument, or listening when Mr. Drawbaugh talked, probably half a dozen times. Can you tell me how long a period it was during which those half dozen trials were made?

A. I could not remember.

Cross-Q. 105. Can't you tell me whether they extended over a period of one month or a longer period?

A. I don't remember.

Cross-Q. 106. Do you remember how it was that Mr. Drawbaugh first came to show you the operation of that instrument?

A. He just took me in and showed me the telephone, and told me I should go down-stairs and listen what he says through this telephone.

Cross-Q. 107. Was that the first time you had seen that instrument?

A. To the best of my knowledge, it was.

Cross-Q. 108. How came he to show you the operation of the instrument at the several subsequent times?

A. That I don't remember.

Cross-Q. 109. At the several trials which you made of the instrument, did it operate just the same at one time as at the other times—that is, could you hear just as well what was said?

A. Could hear better the last; that is, I could understand better.

Cross-Q. 110. Did he say anything about having been improving the instrument or working on it in any way?

A. To the best of my knowledge, he did.

Cross-Q. 111. What did he say about it?

A. I don't know as I can recall the words that he expressed.

Cross-Q. 112. State, as nearly as you can, the substance of what he said.

A. I don't remember.

Cross-Q. 113. Did you see the other instruments which you saw in the same room where the closet was?

A. No, sir.

Cross-Q. 114. In what room were they?

A. The first room I entered after I got up the stairway.

Cross-Q. 115. Whereabouts in the room were they?

A. To the right as I came in, on a bench.

Cross-Q. 116. What other machines or instruments did you see in that room, or in the room where the closet was?

A. I saw the clock, also the faucet.

Cross-Q. 117. In which room was the clock?

A. In the same room where the telephone was fastened to the closet-door.

Cross-Q. 118. Were there any workmen employed on the clocks or the faucets while you were in the habit of visiting Drawbaugh's shop?

A. Yes, sir.

Cross-Q. 119. In what room did they work?

A. The first room, or large room, rather. The first room that we entered on going up-stairs.

Cross-Q. 120. Who worked on the clocks, and who worked on the faucets?

A. George Drawbaugh worked on the clocks, and also Daniel Drawbaugh. J. B. Drawbaugh, Mr. Heiges, (I don't remember his first name, but think it was G. W. Heiges, if I mistake not,) George Rupley, and another whose name I can't recall, who lives in Harrisburg, worked on the faucet.

Cross-Q. 121. You speak of seeing another instrument with a bell on it, besides the one which was fastened to the closet-door. Did you first see that instrument before or after you first saw the instrument fastened to the closet-door?

A. That was afterwards.

Cross-Q. 122. What did Mr. Drawbaugh say to you about that instrument?

A. I don't remember what he said about it.

Cross-Q. 123. You say that you saw the instrument "G" and "O" in the year 1877. How do you fix the time when you first saw them as being in that year?

A. I know by my two brothers being to see me in that year.

Cross-Q. 124. How does the circumstance that your brothers came to see you in that year help to fix the time when you first saw these two instruments?

A. It was the first time they visited me.

Cross-Q. 125. What are the names of those two brothers, and where did they reside?

A. Henry and Michael. They lived in York county.

Cross-Q. 126. Did Mr. Drawbaugh say anything to you about these two instruments when you first saw them?

A. I don't recollect of him saying anything in particular with regard to these here [indicating "G" and "O."]

Cross-Q. 127. How many times did you see those instruments after the first time, and did Mr. Drawbaugh say anything to you about them at any time?

A. I don't remember how often I saw them. He said something to me about them, but I could not remember what.

Cross-Q. 128. Did you see them a good many times?

A. Pretty often.

Cross-Q. 129. Do you remember anything that he said to you about instrument "C" at any time?

A. I don't remember that he said anything about it.

Cross-Q. 130. How often did you see it?

A. Not very often.

Cross-Q. 131. How often did you see the instrument "A?"

A. I seen that very often.

Cross-Q. 132. What did Mr. Drawbaugh say to you about that instrument at the first time you saw it, or at any subsequent time?

A. I have no recollection what he said.

Cross-Q. 133. In your forty-fifth answer you say, "His whole heart and desire was on the telephone." What made you think his whole heart and desire was on the telephone?

A. Because he always talked to me about it, and experimented on it.

Cross-Q. 134. Were you with him when he was experimenting or working on the instruments?

A. I was in the shop.

Cross-Q. 135. Did you see him experimenting with them or working on them?

A. I seen him work on them.

Cross-Q. 136. What instruments did you see him work on?

A. I seen him work on wood-work and on these curled magnets [taking up "D;"] also, on these wires. He had a machine that he was working on that was putting thread or something on the wires. I don't know what it was.

Cross-Q. 137. When was it that you saw him working on the curled magnets?

A. That I am not able to say.

Cross-Q. 138. Can't you tell whether it was during the first year, 1876, or some of the later years?

A. I don't remember.

Cross-Q. 139. Do you remember what he was doing on the curled magnets?

A. He was working on them with a file, if I mistake not. He had a tool, anyhow, that he was working with.

Cross-Q. 140. Did you see what he did with them after he had done working on them?

A. He fitted them into the wooden boxes here on this pivot, [illustrating with machine "E."]

Cross-Q. 141. You say you saw him work on wood-work. What wood-work do you refer to?

A. I mean the wood-work on these telephones. I would not say it was on these. I know it was not on this one ["E,"] for this was the first one that I saw when I came in in 1876, and it was already made when I came there.

Cross-Q. 142. Do you remember his doing anything else on either of the instruments "D" and "E," except working on the curled magnets?

[*Objected to, as assuming that the witness has testified that Mr. Drawbaugh was working on the curled magnets of "D" and "E," whereas his testimony was only that he was working on curled magnets.*]

A. I don't remember.

Cross-Q. 143. When you say you saw him working on wood-work, do you mean that you saw him turning up round pieces of wood similar to the wood-work of "D" and "E"?

A. Yes, sir.

Cross-Q. 144. Did you see him doing that at many different times, or only once?

A. I did not see him do it very often.

Cross-Q. 145. You saw the instruments "D" and "E" a good many times, I suppose?

A. Yes, sir.

Cross-Q. 146. Did Mr. Drawbaugh ever say anything to you at any time about these particular instruments?

A. I can't remember, as I have already stated before.

Cross-Q. 147. You say that you think his whole heart and desire was on the telephone, because he always talked to you about it, and experimented with it. Can't you remember any particular thing that he said about the telephone which led you to think that his whole heart and desire was in it?

A. I don't remember no more than that he was always talking to me about it, and had worked on it after night, and it was always about telephones to me.

Cross-Q. 148. Did not he ever say anything to you about why he kept at work on it, and experimenting on it, and what he hoped to accomplish by his experiments?

A. He may have. I have no recollection of it.

Cross-Q. 149. In your direct examination, you stated that you had seen other instruments in Drawbaugh's shop besides those which you had especially designated, but that you could not recollect how many Can you tell me whether or not there were quite a number of them?

A. I could not say how many. There was not a great many.

Cross-Q. 150. Are you willing to give any estimate of the number?

A. I could not give an estimate.

Cross-Q. 151. Did you see Mr. Drawbaugh at any time doing anything on any instruments except working on the wood-work and on the curled magnets and wires?

A. Yes, sir.

Cross-Q. 152. What did you see him doing?

A. I seen him work on these kind of screws and brass pieces like that [indicating the milled screw and the brass bracket on the back of instrument "A."] I could not say that this is the one that I saw him working at.

Cross-Q. 153. Do you remember what he was doing on the brass bracket?

A. He was polishing it off with a little machine that had a leather pulley on. He used something to put on his leather pulley to polish it bright.

Cross-Q. 154. What did he do with the piece after he had got it polished?

A. I left the shop. Afterwards when I came down, he had it attached to a machine like the machine "A," to the best of my knowledge.

Cross-Q. 155. Did you ever see more than one machine at Drawbaugh's shop like machine "A"?

A. I don't remember that I did.

Cross-Q. 156. What did you see Mr. Drawbaugh doing on wires?

A. I seen him putting thread around it.

Cross-Q. 157. Did you ever see him at work making coils of covered wire similar to those on instrument "A" and in instruments "D" and "E"?

A. I seen him make these kind of wires, though I did not see him put them on this cylinder [indicating the electro-magnet in "E."]

Cross-Q. 158. Do you remember any other work that you saw Drawbaugh doing on telephones, except what you have spoken of?

A. Not that I remember.

Cross-Q. 159. You said you saw the work on the inside of the instrument attached to the closet-door. Do you remember seeing the inside of any of the other instruments which you have identified?

A. I saw the inside of this one ["E."] This is the first one I saw, and it was taken apart when I seen it. He had taken it apart to show it to Mr. Fry.

Cross-Q. 160. Do you remember when it was that you saw him at work on the curled magnets?

A. I don't remember.

Cross-Q. 161. You could not say whether it was in 1876, or in some following year, could you?

A. I could not say what year it was in—that is, between 1876 and 1881.

Cross-Q. 162. Could you give us any idea of when it was that you saw him at work on a brass bracket like that on instrument "A"?

A. I could not say exactly; I could not give no time how long.

Cross-Q. 163. When you saw instrument "E" open, the first time you saw it, were the parts apparently the same as they are now, in all respects?

A. I don't remember any more whether they were all the same or not.

Cross-Q. 164. Now, will you tell us, as nearly as you can, when it was that you saw Mr. Drawbaugh at work on the wood-work of instruments—turning them upon a lathe?

A. I could not tell.

Cross Q. 165. You could not tell whether it was in 1876, or in some of the years following that?

A. I could not tell the exact year.

Cross-Q. 166. Have you, at any time before this, given an affidavit with reference to Drawbaugh's telephones?

A. No, sir.

Recess for dinner until 2, P. M.

May 27, 1881, 2, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

Re-direct by Mr. Hill:

Q. Q. 167. What was the name of your mill firm when you lived at Eberly's Mills?

A. Dellinger & May.

Q. Q. 168. What was its business?

A. Manufacturing flour, cornmeal, chops, etc., at the mill known as Eberly's mill.

Q. Q. 169. Did that firm fail in business? If so, when?

A. In 1879, it failed.

Q. Q. 170. You say Mr. Drawbaugh got flour all along during the time you were running the mill. What was his general condition, as to being able to pay for it, when he got it?

A. He always plead poverty, and we had to trust him along for the flour.

Q. Q. 171. You spoke of a talking-machine that you saw at Mr. Drawbaugh's shop attached to a closet-door. Do you recollect whether you saw that attached to the closet-door before or after Mr. Drawbaugh made the model of the faucet, in 1878?

A. Shortly before.

Q. Q. 172. Could you give us any idea how long before—whether it was a year before, or not?

A. I could not.

Q. Q. 173. Do you think you saw that instrument when it was first made, or might it have been at the shop some time before you first saw it? What do you think about that?

A. I don't know what to think about that Whether it was at the shop or not, I don't know.

Q. Q. 174. Was it in the same room where the workmen were working on the electric clocks?

A. No, sir.

Q. Q. 175. You are somewhat hard of hearing, are you not?

A. Yes, sir.

Q. Q. 176. How long has your hearing been defective?

A. It was either since 1857 or 1858.

Q. Q. 177. You say you recollect seeing the instruments "G" and "O" in 1877 because your brothers came to visit you that year. Was that the first time they had been there to visit you after you moved there?

A. Yes, sir.

Q. Q. 178. Did they both visit you at the same time?

A. Yes, sir.

Q. Q. 179. Did they see the instruments "G" and "O" while they were on that visit?

A. They saw these instruments "G" and "O."

Q. Q. 180. Where did they see them?

A. Down at Drawbaugh's shop.

Q. Q. 181. Were you there with your brothers when they saw "G" and "O?"

A. Yes, sir.

Q. Q. 182. I want to know whether you remember all the work that you saw Mr. Drawbaugh doing on telephones while you lived there, or whether you saw him doing other work on them which you are not now able to describe; what is the fact about that?

A. I don't remember.

Q. Q. 183. You stated, in your direct examination, that you had been at the shop, while you lived there, a great many times, and had seen talking-machines there possibly a hundred times. You have also stated that you frequently saw him at work on talking-machines, and that, during the years 1876, 1877, 1878, and 1879, he was generally experimenting on clocks and telephones, when you were there at the shop,

PHONE COMPANY,-1

and that more of his time and labor was spent on the telephone invention than on any other invention. In cross-examination, you state that you saw him turning the wooden boxes on a lathe, but not very often; that you saw him wrapping wire; also brightening up a brass bracket, also doing something to a screw. What I want to know is, whether the turning of the boxes, the wrapping of the wire, the rubbing of the brass plate, and the working on that screw took all those years, 1876, 1877, 1878, and 1879, or whether there was other work done, the nature of which you do not now particularly recall.

A. There was other work done on the faucets and clocks.

Q. Q. 184. Did you ever see him do any other work on telephones?

[*Objected to because the witness has already stated that there was work done on curled magnets.*]

A. I have already testified that I did not see all the work on telephones.

Q. Q. 185. Do you mean;—did not see all the work that he did on telephones in those years?

A. Yes, sir; that is what I mean.

Q. Q. 186. And do you remember everything that you did see him do on telephones in those years?

A. I don't remember everything.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 27th day of May, 1881.
FRED. M. OTT,
Examiner.

WILLIAM S. DELLINGER.

Adjourned until May 28th, 1881, at 9.30 o'clock, P. M.

May 28, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Smith for complainants, and Mr. Hill, Mr. Jacobs, and Mr. Abraham for respondents.

HIERONYMUS GEISTWEIT, *being produced, affirmed, and examined, saith:*

Examined by Mr. Abraham:

Q. 1. State your age, residence, and occupation.

A. Fifty-five years old; residence, New Cumberland, Cumberland county, Pa. I have been working laboring work for the last few years; running an engine is my business, generally.

Q. 2. What business were you engaged in in the year 1870?

A. I was working at mill-wrighting then.

Q. 3. For whom and at what place?

A. I was working for Mr. Musser at New Cumberland. The works were just across the creek in York county, but I lived in New Cumberland.

Q. 4. When did you commence there? I mean the month.

A. I commenced in the month of July. I could not tell the day.

Q. 5. How long were you engaged as mill-wright for Mr. Musser?

A. After we got the mill done, I worked on the mill, I suppose a year and a half.

Q. 6. In what capacity were you working after the mill was done?

A. After we had the saws both put up, I run one of the saws, on until I quit.

Q. 7. How long were you running one of the saws?

A. I can hardly say exactly how long it took us to finish up the mill, but I think I run one of them a full year, anyhow.

Q. 8. When did you discontinue working at this mill?

A. I went there in 1870, and worked a year and a half there, and then went up to the steam-mill, and run the engine there for Mr. Lee and Bayler, on up to 1876. I then quit business and since then have been around at different things.

Q. 9. While you were engaged, during the year 1870, as before testified to, did you ever pay a visit to the shop of Daniel Drawbaugh, at Eberly's Mills?

A. Yes; in the year 1870, when I went to fix that mill, that was the first time that I ever saw that talking-machine.

Q. 10. Do you recollect what was the business that took you down to Mr. Drawbaugh's shop first in 1870? If so, state.

A. Yes, sir; I do, indeed. We had to have a tool that mechanics that travel out very seldom carry—a ratchet-drill. The shaft of the mill was an iron shaft, and we had to drill a hole in that. Finally, Mr. Musser sent it back by another man. I did not take it back.

Q. 11. How long have you known Daniel Drawbaugh?

A. I have known him ever since I have known anybody, I guess; we went to school together when we were little boys.

Q. 12. Do you recollect what time of the year 1870 it was that you went to borrow the ratchet-drill?

A. Yes, sir; it was in the month of July.

Q. 13. Did Drawbaugh then show you any instruments that he called talking machines?

A. He did, yes; when I went for that rachet-drill he showed me that machine.

Q. 14. Please examine the two instruments now shown you, and state when, if ever, you have seen them before.

A. I saw these two machines then when I went there [indicating "B" and "F."] He had these two in use then—these two by the wire.

Q. 15. Were they connected? If so, how?

A. This here one, ["F"] I think, he had on the inside of the building. The wire ran up along the building, and it ran out the opposite corner. This one [indicating "B"] he had on the outside—not outside of the building, but outside the office.

Q. 16. Did he tell you what they were for?

A. Yes, sir; he explained to me about his talking-machine that he was getting up. He had it up for some time then, but, of course, every day he was putting something to it, and wanted to find out how far he could talk with it—told me that he thought he could talk across the sea with it, just as well as not.

Q. 17. Did he operate his talking-machine while you were there in July, 1870?

A. Yes, sir; he did. He got me to go out of the room to the other end of the wire. I think that he talked into that glass there, [indicating "F,"] and I held my ear to this end of it [indicating end of "B" farthest from the electro magnet.] He spoke some few words, and then hollered out whether I heard it. I told him I did, quite plain and distinct.

Q. 18. Do you mean to say that you heard plain and distinct through the instrument?

A. Oh, yes; no doubt about that.

Q. 19. Did he then speak to you more through the instrument, after the first time, on that day?

A. No, sir; I don't think he did.

Q. 20. You have spoken of connecting wires. Will you please tell us, as nearly as you can, the course and direction of these wires that led from one instrument to another?

A. He had some quite small wires wrapped with colored thread. I could not say what use they were, but they were connected by a wire. I remember his telling me that he had not the wires lapped enough, that he intended to lap them more, that he could then talk through them still better. It was fastened up to the wall, like that, [indicating the wall of the room,] then along the ceiling, near to it, then turned the corner, above the door, and through the board partition until it reached this instrument ["B,"] fastened to the other end.

Q. 21. Do you recollect whether this glass part of "F" was lined or coated with anything?

A. Indeed, I could not say whether it was or not.

Q. 22. Please examine instrument "B," and state whether you remember that there were then any attachments to it that you do not see now.

A. No, I don't think there was, more than the wire is not to it now. I don't think he used either of them long on the wire. He got something better on the wire.

Q. 23. Did you visit Mr. Drawbaugh's shop after July, 1870?

A. Yes, sir; from that on to 1876. I was back and forward there several times; I could not tell how often.

Q. 24. What part of the year 1876 was it when you paid your last visit?

A. I don't know—towards fall, though.

Q. 25. Have you ever been there since the fall of 1876?

A. No, sir; I was not in Dan's shop since. I have been in Milltown a couple of times, but I was not in his shop.

Q. 26. Please examine these three instruments, "C," "D," and "E," and state whether you have ever seen those before at Mr. Drawbaugh's shop.

A. Yes, sir; I saw one of these, or one like them [handling "D" and "E."] I could not say which one, may be both; that is all I know.

Q. 27. Do you recognize any particular parts of those instruments "D" and "E"?

A. I don't know as I do, more than that he had one of those in use. If I had known that I was to come before a justice and take an oath, I would remember it more. I saw many things at his shop that I do not see on the table now.

Q. 28. After Mr. Drawbaugh had spoken to you through his talking-machine in July, 1870, did he operate his talking-machines in your presence?

A. No; I don't know that he ever talked to me through it, but he showed it to me after that.

Q. 29. What did he tell you about them afterwards, when he showed them to you?

A. He still said that he wanted to have it so that he could still talk to a further extent; that he had not as much room there as he wanted to stretch his wire, so he could not get to see how far he could talk. After he had taken that glass off, he put a box on it.

Q. 30. Please examine the instrument "H," and state whether you have ever seen that before. If so, where and when?

A. He had a box like that on his wire, but whether it was that one or not I would not be positive. He showed it to me one day when I drove up there one evening after quitting time, to have some little job done. This may be the very box, but I would not be positive. I did not examine it very close.

Q. 31. When you went there on this occasion that you referred to, he had taken away the glass tumbler and had substituted, in lieu thereof, this box machine "H," or one like it. Is that what you mean?

A. Yes, sir.

Cross-examined by Mr. Smith:

Cross-Q. 32. Whereabouts in the shop was the box machine with the bell on it when you saw it?

A. It was fastened up against the wall.

Cross-Q. 33. What did Mr. Drawbaugh say to you about it?

A. I don't know. He said it would make more of a sound of talking, by talking into a box, larger—something of that amount he talked to me about.

Cross-Q. 34. When you first saw the instrument "F," was it in the same condition as it is now?

A. I judge it was by the look of it. I can't see much difference, for my part, as far as I can see; of course, it has not the wires attached to it.

Cross-Q. 35. Where did you live in 1870?

A. I lived right in New Cumberland.

Cross-Q. 36. Have you lived there ever since?

A. Yes, sir.

Cross-Q. 37. How far is New Cumberland from Drawbaugh's shop?

A. Full two miles and a half.

[*Signature written by Examiner, by consent, owing to his hand being disabled.*]

Examination taken, reduced to writing, and by the witness affirmed to, and his signature subscribed by the examiner, as above stated.
FRED. M. OTT,
Examiner.

HIERONYMUS GEISTWEIT.

LEVI A. BOWEN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, forty-two; residence, New Cumberland; occupation, by trade, a blacksmith. At present I am working at the steel works, Steelton, Dauphin county.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him.

A. Yes, sir; I have known him for about twenty-three years.

Q. 3. Did you ever see any talking-machines in his shop at Eberly's Mills? If so, when?

A. Yes, sir; I saw them about the latter part of September, 1878.

Q. 4. How do you fix the time when you saw them?

A. I went there to get a nurse. My child will be three years old, the 24th day of November. The nurse was to attend my wife during confinement, and I went there about eight weeks before her confinement.

Q. 5. Please look at the instruments marked "D" and "E," now shown you, and state whether you do or do not recognize them as the instruments that you saw at Mr. Drawbaugh's shop at that visit?

A. Yes, sir; I recognize these as the ones that I saw.

Q. 6. Did anybody talk through them while you were there?

A. No, sir.

Q. 7. Where did he keep them?

A. In a cupboard.

Q. 8. And took them out of a cupboard to show them to you?

A. Yes, sir.

EPHONE COMPANY,-1

Q. 9. Did you see any other talking-machines there besides "D" and "E"?

A. No, sir.

Q. 10. What did Mr. Drawbaugh say about other talking-machines, if anything?

A. He said he had other ones.

Q. 11. Where was that cupboard from which he took out the talking-machines?

A. About the east corner of the building, as near as I can tell. I think it stands about east.

Q. 12. Was it in a small room partitioned off from the rest of the building?

A. Yes, sir; it was a room adjoining his work-shop.

Cross-examined by Mr. Smith:

Cross-Q. 13. What did Mr. Drawbaugh say to you about these instruments "D" and "E" when he showed them to you?

A. He said it was a talking machine, that he could convey sound any distance.

Cross-Q. 14. Is that all he said?

A. He said he could attach them to a telegraph wire and communicate with a person in Philadelphia, and would not interfere with the telegraphing.

Cross-Q. 15. Was that all that he said about them?

A. That is about all that I can remember.

Cross-Q. 16. What did he say about the other instruments which he said he had?

A. Nothing more than he said he had other ones.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 28th day of May, 1881.
FRED. M. OTT,
Examiner.

LEVI A. BOWEN.

Adjourned until Tuesday morning, May 31st, 1881, at 10, A. M.

Tuesday, May 31, 1881, 10, A. M.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill and Mr. Jacobs for respondents.

WILLIAM D. SHOOP, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am in my sixty-seventh year; my birth-place and residence is near Shiremanstown, Cumberland county. I have been working for the last year at laboring principally.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. Yes, sir; from the time that he was a boy. Yet I never was very intimate with him. His father and my father occupied a double house together, at one time, at Milltown.

Q. 3. Did you visit his shop at Eberly's Mills at one time in the year 1878? If so, at what time in said year?

A. Yes, sir; I visited it in 1878. It was about the 31st day of August, towards evening.

Q. 4. What did you find Mr. Daniel Drawbaugh at work upon, when you visited his shop, as above stated?

A. I think he was working at a clock.

Q. 5. Did you have any conversation with him about the clock?

A. Yes, sir; he told me that he had invented a clock that would go without weights. My impression is that he called it a magnetic clock.

Q. 6. While he was talking to you about his clocks, did he say anything about any other inventions of his? If so, what other invention?

A. Yes, sir; he told me that he had invented a talking-machine, which would far exceed the clock, and would supersede the telegraph; that, instead of operating with a telegraph key, you done it simply by talking from one to the other. I asked him how far he could talk, and he said distance made no difference.

Q. 7. Did he say anything about patenting the invention? If so, what?

A. Yes, sir; he said he was too poor to get it patented at that time, but as soon as he could get the means, he would have it patented.

[*Answer objected to as hearsay and incompetent.*]

Cross-examined by Mr. Storrow:

Cross-Q. 8. Have you told us all that passed between you on that occasion?

A. All he said about the invention, as near as I can remember.

Cross-Q. 9. Are you sure that nothing else passed between you about talking-machines?

A. No; not that I recollect of at the present.

Cross-Q. 10. What talk did you have about any other inventions besides the talking-machines and what you have told us about the clock?

A. None that I recollect of.

Cross-Q. 11. Who was present at this interview?

A. No person but him and me.

Cross-Q. 12. What machines did you see on this occasion which you understood had been invented by him or made by him?

A. None that I recollect of except the clock.

Cross-Q. 13. Were you ever at that shop at any other time?

A. I was there once before that.

Cross-Q. 14. Do you mean that you were never there but once before that?

A. I mean that I have no recollection of having been there but once before that.

Cross-Q. 15. How many times have you seen Mr. Drawbaugh within the last ten years?

A. Pretty often; I would not undertake to enumerate; frequently.

Cross-Q. 16. Where have you been in the habit of seeing him?

A. From home; I met him out.

Cross-Q. 17. Whereabouts?

A. I have met him in Shiremanstown, Mechanicsburg, White Hill, and I have met him in a store at Milltown, that I recollect of; on the road, and at other places.

Cross-Q. 18. Do you live on the road between Eberly's Mills and Mechanicsburg?

A. No, sir.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 31st day of May, 1881.
FRED. M. OTT,
Examiner.

W. D. SHOOP.

GEORGE H. BOWMAN, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am forty-two; residence, Hummelstown, Dauphin county; my regular trade is millwright; I am milling now.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Penna.? If so, how long have you known him?

A. I have known him since 1876.

Q. 3. How came you to make his acquaintance in 1876?

A. I was working with my brother at Eberly's Mills. He was milling there, and I done the millwright work there, and my brother had no place to work in, and so I went to Drawbaugh's shop to do the work. The work was for the large grist-mill known as Eberly's mill.

Q. 4. In what months of 1876 were you at Mr. Drawbaugh's shop?

A. In February.

Q. 5. Did you see any talking-machines there while you were there at Mr. Drawbaugh's shop?

A. Yes, sir.

Q. 6. Was anybody talking through them?

A. Yes, sir.

Q. 7. Who was talking and listening?

A. I can't tell you who was talking through them. Mr. Drawbaugh was listening.

Q. 8. Where was he, when he was listening?

A. He was on the machinery floor of the shop on the side towards Eberly's mill near the corner, somewhere about the corner, I could not exactly say.

Q. 9. Do you know where the other person was that was talking into the machine?

A. No, sir; I don't.

Q. 10. Did you hear any of the sounds that came through the machine?

A. Yes, sir.

Q. 11. How happened you to hear sounds coming through the machine?

A. I guess there must have been some person at the other end of the wire. I was up close to it—to the machine.

Q. 12. How close were you to the machine when you heard sounds coming through it?

A. I don't think I was over two foot off of it.

Q. 13. How close was your ear to the machine when you heard the sounds coming through it?

A. I could not just tell; may be eighteen inches or two feet, or something like that. I was very close to him, standing right aside of him.

Q. 14. By "him," do you mean Drawbaugh?

A. Yes, sir.

Q. 15. What was he doing with the machine when you heard the sound come through it?

A. He had a kind of an instrument or machine at his ear.

Q. 16. Did you see him talking into a talking-machine while you were there at the shop?

A. Yes, sir; on the same occasion.

Q. 17. Did he listen to hear what came through the machine, and then talk back through the machine to the person at the other end of the line?

[*Objected to as leading.*]

A. Yes, sir; he listened when the sound came back. He talked in and then he listened when the sound came back.

Q. 18. What did it sound like when you heard the sound through the machine?

A. It sounded much like as if you were talking into an empty barrel. I heard the sound, but could not understand what was said.

Q. 19. Did you notice whether the machine was attached to any wires, or not?

A. Yes, sir; I did.

Q. 20. State what it was attached to.

A. It was attached to a kind of a square box.

Q. 21. Was the box attached to anything, or was it so that it could be taken up in the hand?

A. No, sir; it was again the wall somewheres—stationary.

Q. 22. How many wires did you see connected to the talking-machine?

A. I saw one to the machine that he was talking in, but then, as near as I can recollect, there was two other wires run down from the machine to the floor—had some weights or something on, or some kind of stuff in below, I can't tell.

Q. 23. What was the appearance of the stuff in below? What did it look like?

A. Indeed, I can hardly tell you myself. It looked kind of white and greenish stuff.

Q. 24. What was that stuff in?

A. I don't know myself yet, what it looked like—kind of a bottle or jar—maybe it was tin, for all I know. It was so long ago, it has slipped my memory entirely. I did not examine it closely.

Q. 25. Did Mr. Drawbaugh say anything about the talking-machine to you?

A. Not in particular. He showed it to me; that was about all—showed me how it worked.

Q. 26. When were you next at Mr. Drawbaugh's shop after March, 1876?

A. Not till November, 1880.

Q. 27. Please explain what you mean by your twentieth answer.

A. The wire was attached to the square box, and the square box is what he called the talking-machine.

Q. 28. Did he talk into or listen at the square box?

A. He talked into that.

Q. 29. How large was that square box?

A. I could hardly tell you. It must have been about eight or ten inches long, as near as I can recollect, and about four or five inches wide, I guess.

Q. 30. What was its color?

A. I could not tell you that any more.

Q. 31. Do you remember whether its outside was made of wood or not?

A. It was made of wood, but what kind I could not tell you—whether of black walnut or pine, or what kind.

Q. 32. What kind of a contrivance did it have for him to talk into?

A. It was some kind of a machine that was hollowed out that he put his mouth to.

Q. 33. How large was the thing that was hollowed out that he put his mouth to?

A. I could not tell you that any more.

Q. 34. Did you talk into it?

A. No, sir.

Q. 35. How many times did you see that talking apparatus in 1876?

A. Only once; the time I worked there.

Q. 36. Did you work there only once?

A. Just once.

Q. 37. You have given us your recollection of the machine that Mr. Drawbaugh talked into. Do you remember the size of the machine that he listened at when the other man was talking to him?

[*Objected to on the ground that the witness has already testified, particularly in his seventeenth answer, that on that occasion Mr. Drawbaugh listened at the same machine he talked into, and that the whole testimony of this witness, so far, has tended to prove only one machine as in their presence.*]

[*Question withdrawn and following question substituted:*]

Q. 38. Did he talk into and listen at the same machine or different machines?

[*Same objection.*]

A. He talked into one and took another to listen at.

Q. 39. I now repeat the thirty-seventh question.

A. I can't remember that, I don't know what it looked like any more.

Q. 40. Did he take it in his hand and hold it to his ear when listening?

A. Yes, sir.

Q. 41. Was that the machine that you heard the sounds coming through?

A. Yes, sir.

Q. 42. How long were you at Mr. Drawbaugh's shop doing that work on that day?

A. As near as I can mind, about a half a day.

Q. 43. What was going on in the shop at the time, besides Mr. Drawbaugh's operations with his talking-machine?

A. They were working on wagon axles.

Cross-examined by Mr. Storrow:

Cross-Q. 44. What did Drawbaugh tell you he was trying to do with his talking-machines at that time?

A. I can't recollect no more what he told me. He was talking about it, but I can't recollect what he said.

Cross-Q. 45. I suppose he did not just talk into it steadily, without stopping, the whole half a day you were there, did he?

A. No, sir; it was only a few minutes—just showed me how it worked. That was about all.

Cross-Q. 46. You mean that all he did while you were there, about the talking-machines, was just to show them to you, as you have described?

A. As near as I can recollect.

Cross-Q. 47. What was he working on that day?

A. That is more than I can tell, what he was working at. His hands were working on axles. He went after what he was working at, but I did not follow him up. I was attending to my work.

Cross-Q. 48. Was not there a bell on top of the talking-machine that you saw fastened up against the wall?

A. Not that I can mind of.

Cross-Q. 49. Was your brother running the mill on his own account at that time, or what did he have to do with it?

A. Yes, sir; he had the mill rented from Mr. Leonard, and run it on his own hook.

Cross-Q. 50. Did he have a partner; and, if so, who was it?

A. No, sir; he kept a hand.

Cross-Q. 51. Who was the hand?

A. That I am not able to say. A man from Franklin county, as near as I can mind.

Re-direct by Mr. Hill:

Q. Q. 52. How long did your brother run the mill on his own hook?

A. Two years within a month.

Q. Q. 53. Do you remember when he took the mill?

A. In 1874, if I am not mistaken.

Q. Q. 54. Do you know who run the mill after he gave it up?

A. Dellinger & May bought the mill, and Jake Evans was miller. He took the mill when my brother left it.

Re-cross by Mr. Storrow:

Re-cross-Q. 55. What was your brother's name?

A. Cyrus.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 31st day of May, 1881.

FRED. M. OTT,
Examiner.

GEORGE H. BOWMAN.

Adjourned until 2, P. M.

ELEPHONE COMPANY,-1

May 31, 1881, 2, P. M.

Examination resumed, pursuant to adjournment.

Present, same counsel.

CHARLES LINCOLN FREE, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. I am twenty; residence, Camp Hill, Cumberland county; I am a coach-maker by trade.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Penna.? If so, how long have you known him?

A. I have known him for about eight or ten years.

Q. 3. Did you ever see any talking-machines at his shop at Eberly's Mills? If so, when?

A. Between the spring and winter of the year 1879.

Q. 4. State, to the best of your recollection, what time of the year it was when you first saw them.

A. It was in the fall of the year.

Q. 5. How are you able to fix the time as being in the year 1879, between the spring and the following winter?

A. That spring I quit working at the trade. I then stayed with father that summer and winter, and as I had very little to do, I went down to his shop occasionally; and I often got down there, but he only showed it to me once.

Q. 6. State, as near as you can recollect, all that took place with regard to the talking-machine at the time he showed it to you.

A. He showed me in what way—what sound it made, but I can't recollect what he said through it. He opened the case in the corner where the machine was. He told me, then, to go down-stairs. I went down. He told me where it was. Then I listened, to see what he said. The first couple of words I could not understand very plainly, but after that I understood every word he said, plain. Then he told me to go upstairs and talk, and he would listen. He halloed back to me then that he could hear every word I said, through the machine, plain. That is about all that was said then, and I went home.

Q. 7. What was the size and shape of the machine upstairs into which you and Mr. Drawbaugh talked on that occasion?

A. It was something on the order of that machine before you [indicating "J." Something very much like it, if that is not the one

I do not say that is the one; but one like it. He did not show me the inside of the machine, that I recollect.

Q. 8. Do you remember and can you describe the appearance of the machine that you listened at down on the lower story?

A. It was a little round box to put over your ear. It was not very large. It was about two or three inches, I suppose, in diameter.

Cross-examined by Mr. Storrow:

Cross-Q. 9. Who are you working for now, and where?

A. Walmer & Fox, coachmakers, Hummelstown, Dauphin county.

Cross-Q. 10. How long have you been with them?

A. Almost a year.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 31st day of May, 1881.

FRED. M. OTT,
Examiner.

CHARLES L. FREE.

Adjourned until June 1, 1881, at 10 o'clock, A. M.

Wednesday, June 1, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, and Mr. Hill, and Mr. Jacobs for respondents.

GEORGE LEWIS HALE, *being produced, affirmed, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Born August 13th, 1835; reside in Harrisburg on Balm street; occupation, tinner and coppersmith.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. I have known him since about 1860,—somewhere along there. I got acquainted with him while I was in Shiremanstown, and that was between 1858 and 1860. I think it was in 1860, though, that I got acquainted with him.

Q. 3. Did you formerly work for Hauck Brothers, at Mechanicsburg, Cumberland county, Penna.? If so, from what time to what time?

A. I commenced working there the last of May or first of June, 1873, and worked there until some time in February, 1876. I think it was the last week in February that I left there and come over to Harrisburg, where I have resided ever since, and have been working for Zollinger & Burke, 307 Market street, during the whole time. While working for Hauck Brothers, I lived at Mechanicsburg.

Q. 4. While you were working for Hauck Brothers, were you ever at Mr. Daniel Drawbaugh's shop, at Eberly's Mills? If so, when were you first there?

A. Yes, sir; it was in the fall of 1873.

Q. 5. Do you remember how you happened to go down there in the fall of 1873?

A. I went down there for a lot of molasses faucets.

Q. 6. While at Mr. Drawbaugh's shop at that time, did he show you any talking-machines?

A. Yes, sir; he showed me a machine there that he called a talking-machine.

Q. 7. Please look at the machines now shown you, marked "B," "F," and "C," and state when and where you first saw them.

A. I saw them in Milltown, there in his shop. I think it was on the second floor in a small room there that he kept for himself. I saw them in the fall of 1873, at the time of the visit above referred to. I don't know the month or the day, but I know it was in the fall, and I know what kind of weather we had when I was there; it was slushy weather; there was snow and wet, and the roads were so bad that I broke a spring of the wagon with the load that I had on.

Q. 8. Did Mr. Drawbaugh at that time talk through the machines to you, or did you hear anybody talk through them?

A. No, sir.

Q. 9. Did you have any conversation with Mr. Drawbaugh about the talking-machine at that time? If so, state, so far as you recollect, what was said.

A. He explained the machine to me and said that he was trying to get up a machine that any person could talk through it or use it; that it would do away with the telegraphing; that any person could talk to another without using any instrument or anything that not every person could understand. He said that he could talk with this machine to the house or any place—to the stores there in Milltown.

Q. 10. At the time when you saw this machine "B" there in the fall of 1873, were the ends of the tin box open, or was either of them closed, and if closed, which end, and how?

A. The end toward the coiled wire here was closed with what I thought was sheepskin or bladder.

Q. 11. Was this machine "C" in the same condition then as now, and if not, how did its condition then differ from now?

A. It had a magnet on here, [indicating the board about the point marked "X,"] when I saw it.

Q. 12. What was the shape and size of that magnet?

A. A horse-shoe magnet. As near as I can get at it, it was about six inches long, and about three inches wide. Somewheres along there.

Q. 13. Which end of that magnet was towards the metal diaphragm?

A. The open end.

Q. 14. Show us how that magnet was arranged.

A. Just in this way, [indicating with two fingers the magnet arranged in a horizontal position, with the two poles in the same horizontal plane, and extending towards the middle of the diaphragm.]

Q. 15. After that visit in the fall of 1873, did you ever again see any talking-machines at Mr. Drawbaugh's shop? If so, when, to the best of your recollection?

A. I think it was in the fall of 1875, as near as I can recollect, that I again saw a talking-machine there.

Q. 16. Please look at the machine marked "D," now shown you, and state whether you recognize it as ever seen by you before, and if so, state when and where you first saw it.

A. This machine I saw there in the fall of 1875, when I was there. He said it was an improvement on his first machine.

Q. 17. Since you stopped working for Hauck Brothers, in February, 1876, have you, or not, ever been at Mr. Drawbaugh's shop, at Eberly's Mills?

A. Not that I can recollect of.

Q. 18. When you saw this machine, "C," at Drawbaugh's shop, in the fall of 1873, do you remember whether there were any wires connected to the magnet on the machine?

A. There were some copper wires connected with it.

Q. 19. Do you remember where you were residing at the time of the Centennial Exposition at Philadelphia?

A. I lived in the same house, on the same street, that I live on now.

Q. 20. Did your family attend the Centennial?

A. Yes, sir; we were all down.

Cross-examined by Mr. Storrow:

Cross-Q 21. Who was present at Drawbaugh's shop on the first occasion you have testified about?

A. There was no person there but Mr. Drawbaugh; that is, not where I saw the machine—where him and I were talking together.

Cross-Q. 22. Who was at work in the shop?

A. His brother, 'Squire Drawbaugh; I think his name is John.

Cross-Q. 23. Who was present on the second occasion you have testified about?

A. No person, but Mr. Drawbaugh.

Cross-Q. 24. Who was at work in the shop at that time?

A. No person; no one there but Mr. Drawbaugh and myself.

Cross-Q. 25. When you saw the instrument "C," did he give you to understand that it had always had that magnet on it?

A. Yes, sir.

Cross-Q. 26. Did you notice whether the two upright pieces of wood were cut out, or hollowed out, at the back sides as they are now?

A. Yes, sir.

Cross-Q. 27. What fitted into that hollow at the time you saw it?

A. I can't tell exactly. That magnet was fixed on here some way, but I don't recollect how it was. I remember that it was on this platform here, but how it was fastened I can't tell. It has been so long, and I did not pay much attention to it, so that I forgot how it was fixed there. Generally, when I see a thing that way, I look at it, and I don't remember much about it, unless it is something very interesting.

Cross-Q. 28. Did you ask him to show you a talking-machine, or did he just offer to show it to you, and make the first motion?

A. He offered to show it to me.

Cross-Q. 29. Tell me everything else he said to you about it on that occasion, that you can remember.

A. He told me to come into the room there. He was working in the outside room. I don't recollect; I think it was on the second story, where the machinery was. He had a little room there he kept for himself,—always kept it locked. I don't know whether it was on the second or third story. I think it was on the second story, the first floor above the basement, that he had his room. He showed me the machine, and said he was getting up a machine to answer in place of telegraph. That two persons could talk to each other without using any machinery that other persons did not understand; any person could talk through it.

Cross-Q. 30. Can't you recollect anything else he said to you about it? If so, please state it.

A. I mind of him saying it was driven by a magnet,—in that way—same as the telegraph. I did not have time to talk with him much—too short a time.

Cross-Q 31. Please state all that he said to you about talking-machines at the second visit that you have testified about.

A. He showed me this machine here, ["D"] and he said that it was an improvement on the old machine that he had.

Cross-Q. 32. Is that all he said to you?

A. He showed me different things, and, as we walked along there, he picked this ["D"] up from the bench, and said, "This is an improvement on my old talking-machine." That is all the explanation he gave me about it.

Cross-Q. 33. Was that the whole of your conversation about talking-machines on that occasion?

A. Yes, sir; times that I went down there I always went on business—for faucets; time was always precious. We would slip through, and he would show me the things, and then I would load up my load and be off.

Cross-Q. 34. What work did you do for Hauck Brothers at Mechanicsburg?

A. Worked at tinning.

Cross-Q. 35. Where did you work?

A. Mechanicsburg, Cumberland county.

Cross-Q. 36. In what shop?

A. In Hauck & Co.'s stove and tin establishment.

Cross-Q. 37. You mean you worked on stove and general tinware?

A. I worked on roofing, spouting, and general tinware.

Cross-Q. 38. Who were the firm of Hauck Brothers?

A. George and Samuel Hauck, Jrs.; that was the firm I worked for. There was another firm of George and Samuel Hauck, Sr., but that was a different concern.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 1st day of June, 1881.
FRED. M. OTT,
Examiner.

G. L. HALE.

WILLIAM B. STONE, *being produced, affirmed, and examined, saith:*

Q. 1. State your age, residence, and occupation.

A. Fifty-one; residence, Siddonsburg, York county; occupation, farmer.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. I have known Daniel Drawbaugh for about twenty years.

Q. 3. Please state whether or not you ever saw any talking-machines in his shop at Eberly's Mills, and if so, when.

A. I did; on the fifteenth of October, 1871.

Q. 4. How do you fix the date?

A. On that day I went over to George Free's, near White Hill station. I took over a couple of papers of chicken powder. Then I went from Mr. Free's down to 'Squire John Drawbaugh's, a brother of Dan Drawbaugh, and from the 'Squire's down to Dan Drawbaugh's factory. He was in the factory.

Q. 5. Did you make, at the time, any written memorandum or book-entry of your visit to Mr. Free?

A. Yes.

Q. 6. Will you please produce the book and point out the entry to the examiner, in order that he may copy it upon the record?

A. Here it is.

[*The witness produces a book and points out a memorandum, which the examiner copies, as follows:*

"*Sold Mr. George Free*
2 *packages of chicken*
powder, 25 *cts.*=50.
Oct. 15*th*, 1871———"]

Q. 7. Was this entry made in your own handwriting at the time?

A. Yes, sir; in my handwriting.

[*Objection to the use of the entry in the book, unless the book itself is put in evidence.*]

[*Witness states that there are a few pages containing private entries, which he prefers not to exhibit, and by consent, those pages are cut out by the witness and retained by him. The book is then put in evidence by Mr. Hill, marked on the outside, and also on the page containing the memorandum above referred to, with the words "Exhibit Stone."*]

Q. 8. Will you please look at the machines marked "B," "F," and "C," now shown you, and state whether you ever saw them before today, and if so, when and where?

A. This machine ["F"] I did and this one ["C"] also, and I saw this machine ["B"] also, at the same time. It was at Mr. Drawbaugh's factory, the 15th of October, 1871.

Q. 9. Did you ever see any talking-machines at Mr. Drawbaugh's shop after that day?

A. I don't recollect. I was in his shop once afterwards. I was only there a few moments, and then he was very busily engaged, and did not appear to have time to look around, and so I left him.

Q. 10. At the time when you saw those three machines, on the 15th of October, 1871, did you have any conversation with Mr. Drawbaugh about the talking-machine? If so, state all that you can remember of it.

A. I told Mr. Drawbaugh, I heard he was getting up a talking-machine. He said he was; then he showed me this ["F,"] and also this ["C,"] and this ["B,"] at the same time. I asked him whether he thought it would work. He said he was satisfied that it would. He said it was something that would astonish the world. That is about all the talk we had about it, at that time.

Q. 11. Did you ever have any talk about it with him afterwards, when you saw him for a few moments, as you have testified?

A. No; we did not talk any about it then.

Q. 12. Did he talk through the machines for you, at the time when you saw them in 1871?

A. No; he did not talk through them. He just merely showed them to me.

Q. 13. Do you recollect whether you saw anything belonging to the machines in 1871 that you do not now see on them?

A. No, I don't; it appears to me they are about the same as they were then. I don't think there is any change on them. This old glass [" F, "] particularly drawed my attention—the bottom being out.

Cross-examined by Mr Storrow:

Cross-Q. 14. Where did you live in 1871?

A. In Harrisburg.

Cross-Q. 15. Which street and number?

A. At four fifty-eight Cumberland street. I made my home with my sister, whose name is Mary E. Jones. I have been a widower for fifteen years.

Cross-Q. 16. Where do you live now?

A. I live about a mile from Siddonsburg.

Cross-Q. 17. In which direction from Siddonsburg, and on what road?

A. It is on the road leading from Mechanicsburg to Pinetown and Lewisberry. I live south of Siddonsburg.

[*Mr. Storrow asks the examiner to note the following things from the book " Exhibit Stone." It is entitled on the cover: " Pierce's Memorandum and Account Book,' "A present from the People's Medical Servant, R. V. Pierce, M. D." It consists of alternate pages of printed advertisements and recommendations of his medicines, and blank pages for memoranda; on the outside of the cover the following is printed: "Entered according to act of Congress, in the year* 1876, *by R. V. Pierce, M. D., in office of Librarian of Congress, at Washington." Under the head of " consumption," the first letter of recommendation, which is printed, is dated, " Shipman, Ill., June* 13, 1876."]

Re-direct by Mr. Hill:

Q. Q. 18. This memorandum book, which I had not examined until during your cross-examination, was not printed until as late as 1876 or 1877. Explain how you could make a memorandum in a book in 1871, when the book was not printed for five or six years afterwards?

A. I had an old book that I carried in my pocket for a long while. It became almost worn out; it was nearly all destroyed and obliterated that I hardly could read it. I took and copied this out of that book into this.

Q. Q. 19. What has become of that old book?

A. It is all worn out. It may be lying around home somewhere, or leaves of it, but I don't know where it is. My attention was particularly called to this, because this chicken powder, that I sold to Mr. Free, was the first I ever sold; it is my own invention.

Q. Q. 20. How long ago did you copy off the memoranda from the old book on to this one?

A. About two years ago; I think in 1879.

Q. Q. 21. In your fifth answer, you stated that you made a written memorandum at the time of your visit to Mr. Free. In my sixth question, I asked you to produce the book in which you made it, and in reply you produced this book. Did you, or did you not, understand my question as calling for *the* particular book in which you first entered the memorandum?

[*Question objected to as leading and improper.*]

A. No; I did not understand it.

Q. Q. 22. What is your recollection as to the time when you invented the chicken powder which you refer to?

A. The time I invented the chicken powder I was living here—in Harrisburg.

Q. Q. 23. When did you move away from Harrisburg?

A. About October, I think, 1879, I permanently took my things over there from here.

Q. Q. 24. How certain are you that when you copied the entry about the visit to Mr. Free, from the old book into the new one, you copied it correctly?

[*Objected to, unless the old book is produced, or its absence accounted for.*]

A. I am very well satisfied in my own mind that I did,—that I copied it just as it was in the old book.

Q. Q. 25. When you return home, will you make thorough search for the old book or its leaves, and if you can find it, or any part of it, will you produce it here?

A. I will.

Re-cross by Mr. Storrow:

Re-cross-Q. 26. Who told you to bring this book with you to-day?

A. No person, to day. Yesterday I was asked the question about what time I was over at Mr. Drawbaugh's. I said I could not say just the day and time. I thought it was in 1871 or 1872, but I knew that I had made a memorandum of the time that I went over to Mr. Free's with the chicken powder, for on that same day I went down to Mr. Drawbaugh's. I had to go home yesterday to bring this book.

Re cross-Q. 27. Did the gentleman you were talking with yesterday tell you that you were to go home and get this book, and then come back and testify?

A. Yes; they said it would be better for me to get it, that they would like to know the time.

Re-cross-Q. 28. Where was it that you had this conversation yesterday?

A. Up in Mr. Jacobs' office.

Re-cross-Q. 29. Was it in the forenoon or in the afternoon?

A. I think it was in the afternoon. No, I am mistaken, it was just about dinner-time, at noon.

Examination taken, reduced to writing, and by the witness affirmed and subscribed to before me, this 1st day of June, 1881.
FRED. M. OTT,
Examiner.

W. B. STONE.

Recess for dinner until 3, P. M.

E. B. HOFFMAN, *being produced, sworn, and examined, saith:*

Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Age, thirty-five; residence, 1335 Ridge Road, Harrisburg; occupation, machinist.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. I have known him since 1861 or 1862,—around there some time.

Q. 3. State whether or not you worked at Mr. Drawbaugh's shop, at Eberly's Mills, prior to 1870, and if so, state for whom you worked, what you were working upon, and at what time you began.

A. Yes, sir; I worked there in 1868, for the Drawbaugh Faucet Company, if I am not mistaken in the name of the firm. Mr. Gorgas and others were connected with it. I was working upon molasses faucets and rotary pumps. I think I began the latter part of March or the beginning of April. It was pretty cold yet I can't tell the exact date. The firm had gone to work there before I came.

Q. 4. How long did you continue to work for said Faucet Company?

A. Until the latter part of September of the same year.

Q. 5. While you were working there for said Faucet Company, did you or not have any knowledge of Mr. Drawbaugh's talking-machines?

A. I did. I seen him working on one. He called it "a talking-machine at the time."

Q. 6. Do you see the instrument here which you then saw him working upon?

A. I do, or one like it. This here [indicating "F."]

Q. 7. What was he doing to the instrument "F," or any part of it, at that time?

A. I seen him turning this wooden top, and fitting it on. At that time there was nothing but the clear glass. There was no coating inside.

Q. 8. How happened you to see him turning that top and mouthpiece?

A. I was down at the shop. I used to go down there in the evening, after working hours.

Q. 9. Do you recollect a freshet that occurred in that locality some years after the time you have referred to, which washed away several bridges on the Yellow Breeches creek?

A. I do; there was a freshet in 1873, in the latter part of the summer. I can't remember the exact time. I was on the creek at the time. It washed away the foot-bridge at the mill known as Dittler's mill at that time; and also the red bridge up at Heck's.

Q. 10. How happened you to be out on the creek at that time, and how long were you there in that vicinity?

A. I was up there fishing for fish and turtle. I was there four days.

Q. 11. During any of those four days, were you at Mr. Drawbaugh's shop, at Eberly's Mills?

A. I was; once or twice in the four days.

Q. 12. State whether you saw any talking-machines at that shop at that time.

A. I did; at least he told me they were talking-machines. I did not examine them.

Q. 13. Please look at the machine marked "C," now shown you, and state whether you ever saw it before to-day. If so, when you first saw it.

A. I saw that machine, but I can't tell the date. It was a good while ago. I saw this other machine [indicating "I"] at the time I was up there fishing; and I saw "C" before that. There is not all of this machine "C" here that I saw at that time.

Q. 14. Please state what part or parts of the machine "C" that you saw at that time are not now here.

A. There was a large horse-shoe magnet that extended out about two inches over the back end of the base board that is not here now. I should judge it was about eight inches in length. It was made of four pieces of steel, about one eighth of an inch thick, riveted together, one on top of another.

Q. 15. What, if any, conversation did you have with Mr. Drawbaugh at the time he showed you the machine with that magnet?

A. We had been talking about machinery on the lower floor of the shop. He told me that he had made a new powerful magnet for his talking-machine, and that I should come up stairs and see it.

Q. 16. Did you at any time see this machine "B," whilst you were in the shop? If so, when first?

A. I might have seen it, but I can't recollect of seeing it—can't name no time. I am not positive on that question. He had so much there that I could not recollect.

Q. 17. Did you ever talk or hear anybody talk through his talking-machines while you were there?

A. I never talked through one at that time. I have since, but I heard Mr. Drawbaugh talk through one at that time.

Q. 18. Were you at Mr. Drawbaugh's shop several times between the summer of 1868 and the time of the freshet?

A. Yes; I was there once or twice between that time.

Q. 19. When did you first hear Mr. Drawbaugh talk through the talking-machine?

A. In the fall of 1871.

Q. 20. Did you understand what he said through the machine?

A. Yes, sir; he asked me through it what I thought of the machine. I was down-stairs at the time, and he spoke through it.

Q. 21. You say that you afterwards talked through one of his talking-machines. Do you remember when that was?

A. I think it was in October, 1874.

Cross-examination waived by Mr. Storrow.

Examination taken, reduced to writing, and by the witness sworn and subscribed to before me, this 1st day of June, 1881.
FRED. M. OTT,
Examiner.

E. B. HOFFMAN.

Adjourned until June 2d, 1881, at 10, A. M.

June 2, 1881.

Examination resumed, pursuant to adjournment.

Present, Mr. Storrow for complainants, Mr. Hill and Mr. Jacobs for respondents.

GEORGE FREE, *being produced, affirmed, and examined, saith:*
Examined by Mr. Hill:

Q. 1. State your age, residence, and occupation.

A. Forty-one; residence, White Hill, Cumberland county; occupation, at present, dealer in cattle, horses, and all kinds of stock.

Q. 2. Do you know Daniel Drawbaugh, of Eberly's Mills, Cumberland county, Pa.? If so, how long have you known him?

A. Yes, sir; I have known him for thirty-five years or more.
